Government expenditures for defense and World War II activities reached an aggregate of \$339,000,000,000 by mid-1946. This amount exceeded the increase in the national debt from 1941 to 1946 by \$128,000,000,000. Early in 1941, defense needs started to make heavy demands on the U.S. treasury, and in that year the department adopted a vigorous program to increase the sale to individual investors of U.S. savings bonds, Series E, F and G. Series E bonds were designed for the small investor and differed from the earlier issues of savings bonds only in the schedule of redemption values during the early years. If held to maturity they would yield to the purchaser the equivalent of 2.9% interest compounded semiannually. Series F and G bonds were designed for trustees, pension funds, large individual investors and corporations other than commercial banks. Their yield

During the war years, when government expenditures mounted, the need for placing as great a volume of U.S. treasury obligations in the hands of individual holders as possible became more acute. Government bonds purchased by commercial banks created bank deposits and resulted in the monetization of the government debt, thus becoming a potential source of inflation. Moreover, in view of the volume of government debt, it was most desirable, as a matter of public policy, to maintain a wide, popular distribution of bond ownership.

In the eight successive war loan drives, when sales of all types of securities were offered to the public, savings banks assumed an active part in this important sales project. The secretary of the treasury appointed a savings bank executive as liaison officer between the savings banks and the treasury. Savings bankers held important posts on war finance committees and savings bank employees joined the ranks of door-to-door salesmen. Extensive advertising and other promotional campaigns were launched by savings banks to promote war bond sales. Many of these campaigns were anti-inflationary in purpose, urging people to buy bonds, pay debts and spend carefully. The result was sales by mutual savings banks of more than \$1,700,000,000 of U.S. bonds during the years 1941-45, inclusive. This achievement earned for the banks and their staffs high commendation from the U.S. treasury department.

Although the designation of savings banks as issuing agents for Series E bonds and sales agents for Series F and G bonds was originally intended to facilitate war financing, banks continued to sell these obligations to the public. It became desirable to promote the sale of savings bonds to offset the redemptions which inevitably took place. Savings banks in general regarded the sale of savings bonds as an additional service to the public and not as competitive with their principal activities. These bonds, a ten-year investment, supplemented the easily withdrawn savings account. Many banks included savings bonds in a "packaged savings plan" designed to give a well-rounded financial program for the individual, including in some cases a bond subscription, a life insurance policy and a savings bank account.

Other Developments.—During the decade, the most evident occurrences affecting savings banks resulted directly from World War II, although other developments arising from general economic conditions and a desire to offer increased service to the public were of importance. As a whole, the banks were self-critical, realistic and progressive in meeting new problems and new competition from other types of savings institutions.

One of the developments of particular significance was the authorization in 1945 by the state of New York of savings bank investment in equity housing. Subject to conditions prescribed by the banking board, banks in that state could own the stock and obligations of corporations organized for the purpose of constructing housing. Prior to 1945, savings banks were not permitted to own and operate real estate except as acquired through foreclosure of a mortgage, or for use as a banking house. Under later regulations of the banking board, savings bank housing projects were intended for the lower and middle income groups since rentals were limited to \$25 per room per month.

In 1946, general conditions in the construction industry prevented the full use of this new field of investment. In common with all postwar housing attempts, construction of savings bank housing projects was seriously

hampered by scarcity of materials and strikes and a constant increase in the cost of building. Some progress was made, however, and New York savings banks entered into mutual agreements for the ultimate construction of 8 projects involving an approximate cost of \$46,500,000 and provision for 17,000 rooms. Five of the projects were located in New York city, one in Schenectady county, one in Dutchess county and one in Westchester county, all in New York state.

These savings bank housing projects were developed by the banks through the instrumentality of the Savings Banks Trust company, an institution wholly owned by the savings banks of the state. A special housing division of the trust company acted as a co-ordinating agency, making preliminary studies of need, location, design and costs. When working plans were tentatively completed, the original savings bank stockholders generally offered participation to savings banks in the immediate locality. The trust company supervised construction and served as the banks' agent until the project was completed.

The commonwealth of Massachusetts pioneered in the field of making personal loans available to borrowers at savings banks. In 1945 the commonwealth authorized its savings institutions to make unsecured personal loans up to \$1,000 to mortgagors for the purpose of repairing or remodelling mortgaged property. Subsequently, loans for any purpose on the note of one maker in amounts up to \$1,000 were authorized without security.

The end of the war revived services necessarily curtailed while hostilities continued. Foreign exchange services were again offered by savings banks for the purpose of selling foreign remittances. One New York city savings bank issued .025% of the total foreign remittances sold in the United States during the first year following the close of the war. Travel information bureaus, durable consumer goods and housing exhibits and special systematic savings plans were used to advantage in stimulating the habit of thrift. The public became educated to the convenience of savings bank money orders. During 1945, 915,000 money orders were issued by savings banks in New York state at a cost to purchasers lower than that charged for postal money orders.

Although not a new development, savings bank life insurance experienced an impressive growth during the decade. First introduced in Massachusetts in 1908, the movement did not spread outside that commonwealth until 30 years later when New York state adopted similar legislation. In 1941 Connecticut followed suit. By mid-1946 the savings bank life insurance system in the United States had more than \$379,000,000 of insurance in force (\$290,000,000 in Massachusetts, \$82,000,000 in New York, \$7,000,000 in Connecticut).

Savings bank life insurance was sold "over the counter," thereby eliminating the expense of canvassing, and thus reducing the cost of insurance to the purchaser. Medical examinations were required for all applicants and the usual standard types of policies, except industrial insurance, were issued. Both the New York and Connecticut statutes were patterned after the Massachusetts Savings Bank Life Insurance law. Since the life insurance departments were operated independently of the savings account business, insurance policies were not secured by assets of the savings bank but by the assets of the insurance department and a central reserve fund. Through operation of a central reserve fund, mortality losses of all savings bank insurance departments were equalized throughout

the state. The fund charged or credited insurance departments with amounts necessary to equalize the effect of variations of mortality of policyholders in particular insuring banks from the projected mortality of policyholders of all insuring banks.

The maximum amount of savings bank life insurance that could be purchased by an individual was limited by statute. In New York and Connecticut the limit was set at \$3,000 per individual. An issuing bank in New York could sell a policy for the full \$3,000 but was required to reinsure \$2,000 with two other insurance banks. An issuing bank in Connecticut was limited to \$1,000 on any one life but could assign an additional \$1,000 to each of two agency banks. The Massachusetts law permitted a \$1,000 policy to be bought by an individual from each issuing bank, the banks themselves having set a maximum limit of \$25,000 on any one life.

Deposit Insurance.—From the standpoint of internal management, a major development occurred in the savings bank system in 1943. In that year 121 savings banks in New York state, not previously members of the Federal Deposit Insurance corporation, were admitted to membership. Banks in several other states took like action with the result that by July 1946, 191 banks having 67% of the deposits and 63% of the accounts of all the 531 mutual savings banks in the country were members of the insurance corporation. Of the total of 191 member banks, 131 were located in New York, 22 in New Jersey and 38 in 12 other states.

Savings banks holding membership in the Federal Deposit Insurance corporation were subject to regular examination by that body as well as by the state supervisory agencies. To assist the board of the corporation in conducting its relations with savings banks, the corporation appointed an advisory council consisting of executives of leading member banks and representatives of the state supervisory authorities.

In Massachusetts and Connecticut, protection for depositors against loss was provided through central funds, financed by the banks within each state.

Group Activities.—In addition to the activities carried on by the National Association of Mutual Savings Banks and the various state associations, other organizations contributed to the well being of the savings banks. These organizations were jointly owned or controlled to perform services more efficiently. Of outstanding importance in this field were the Savings Banks Trust company and the Institutional Securities corporation, established by the savings banks in New York state in 1933, under special act of the legislature, to provide a means of increasing liquidity of assets.

The trust company started business with a capital and surplus of \$5,000,000 which was subscribed to by the banks in a fixed ratio to their deposits. Additional funds were raised from the issuance to the banks of capital debentures. The trust company found an important and profitable place in savings bank management by rendering many useful services, including investment advice and analysis, handling subscriptions to government bond issues, taking custody of portfolios, housing project development, money orders and other functions implicit in trust powers. In addition, the trust company was able to pay substantial interest on time deposits of savings bank funds while earning satisfactory returns for the stockholders. During the war the corporation also served as a depository for the United States government.

For the first ten years of its existence, the trust company, under appropriate committees, administered the mutual deposit insurance fund by which the New York mutual savings banks then insured their deposits, with the exception of two which had remained in the Federal Deposit Insurance corporation, after the termination of the temporary federal insurance fund in 1934. In administering the mutual fund, the Savings Banks Trust company assisted banks in the liquidation of substandard assets and facilitated a number of consolidations. Its services in this field were unique in the history of banking in the United States and were of highly constructive character. This activity came to an end in 1943 when the mutual fund was discontinued, and under the persuasion of the superintendent of banks all the savings banks of the state not formerly members of the Federal Deposit Insurance corporation joined the federal agency.

Under the revision of the state banking laws in 1938, the Savings Bank Trust company, or 20 or more savings banks acting together, could petition the state banking board to add new securities to those previously declared legal for investment by the savings banks. To mid-1946, the trust company was instrumental in obtaining the addition to the eligible lists of 117 corporate issues with an aggregate par value of \$4,508,000,000.

The Institutional Securities corporation, with authorized capital of \$10,000,000, was organized to provide extra liquidity through securing loans from the Reconstruction Finance corporation on mortgages purchased from the banks. When the need for this safeguard abated, the securities corporation broadened its activity to include the servicing of mortgage and real estate investments and investing in mortgages. To the extent authorized by the banking board, this corporation issued debentures to savings banks to obtain funds for investment in mortgages insured by the Federal Housing administration anywhere in the United States and in which individual banks were not permitted by law directly to invest their funds. This device broadened the investment field of the savings banks somewhat but was not greatly used because of the lack of opportunity for suitable investments.

In Massachusetts a similar program of joint investing was undertaken later by the establishment of the Savings Bank Investment fund, a vehicle through which the savings banks acquired an opportunity to invest in securities not eligible for purchase by individual banks. Banks could invest up to 10% of their deposits in the fund, which was managed by a board of directors elected by the directors of the Mutual Savings Central Fund, Inc., organized under a law adopted in 1932 to assist in providing funds for liquidity and maintained by contributions from all savings banks of the state.

Great Britain.—Deposits in the trustee savings banks of Great Britain experienced an even more spectacular growth than did the mutual savings banks in the United States after 1938. Table V shows a growth of 150% in deposits in British trustee savings banks, compared with a 50% increase for the same period in U.S. mutual savings banks:

Table V.—Balance Due to Depositors, Trustee Savings Banks

	March 31, 1938	October 31, 1945
Ordinary department *	£133,872,000	£483,509,000
Special investment dept. *	94,438,000	114,500,000
Total	228,310,000	598,009,000
Government—stocks	37,398, 000	71,035,000
Total	£265,708,000	£669,044,000
* Including estimated accrued interest		•

The trustee savings banks had to meet many problems arising from the impact of the war and, in addition, they gave sustained support to war bond sales. One of the most urgent of these problems arose from the sudden removal from home and employment of many depositors because of air attacks or home defense measures.

The Trustee Savings Bank association provided the means for such co-operation between the banks in meeting emergencies.

Immediately on the outbreak of World War II, a plan was put into effect by agreement between the National Debt commissioners, the post office, the joint state banks and the Trustee Savings Bank association, whereby depositors might, within certain limitations, transact banking business with their home banks, although situated in other localities.

The increase in deposits of trustee banks reflected the intensive drive made by these institutions in the financing of the war since deposits in the banks served the same national purposes as war issues. In England, all funds in the so-called ordinary accounts of trustee savings banks, constituting the bulk of their deposit liability, were turned over to the national debt commissioners for investment in government securities. Deposits in "special investment accounts," time deposits lodged for special investment, could be invested by the trustees of each bank only with the consent and under the control of the government. During the war, trustee banks participated successfully in the sales of savings bonds and certificates in collaboration with the post offices and savings groups by appealing to the small investor through various publicity and promotional devices.

Sweden.—In the autumn of 1945, the Swedish Savings Banks association commemorated the 125th anniversary of the savings bank movement in Stockholm. During the intervening years, savings banks had become an important part of the national economy in Sweden. In 1946, there were 463 banks varying in size from an institution with the equivalent of £20,000,000 to small parish banks with a few thousands of pounds to the credit of their depositors.

The institutions continued to be managed by boards of directors chosen by a larger body of headmen. These headmen, numbering about 30–50, were similar to the board of trustees and managers of the British trustee savings banks, except that one-third were nominated by the town council or other local authority. Of a savings bank's investments 30% were represented by national government or municipal loans.

Most of the banks' funds were invested in real estate mortgages owned by private individuals or public housing corporations.

Bank of England

To the Bank of England's traditional functions as financial adviser to the government, bankers' bank and manager of the national debt, the establishment of the exchange equalization account by the Finance act (1932) had added a new and important duty concerned with the international value of sterling. When the United Kingdom was on the gold standard, the bank had a statutory duty to maintain exchange rates within very narrow limits of buying and selling gold at fixed prices. It was now charged with the day-to-day management of a government fund by which exchanges were not necessarily to be stabilized, but disorderly and violent fluctuations in rates were to be eliminated. The years of gathering storm preceding Sept. 1939 gave full opportunity for the exercise of the bank's new and developing technique.

In domestic affairs, the period preceding the outbreak of World War II was marked by a continuance of the cheap money policy inaugurated with the war loan conversion of 1932. The bank rate remained at 2% until Aug. 24, 1939, when it was raised to 4%; it returned to 3% on Sept. 28 and 2% on Oct. 26, at which level it still remained in 1946. Certain statutory changes of no fundamental importance to the constitution of the bank were made by the Currency and Bank Notes act (1939) which came into force on March 1, 1939. The limit of £260,000,ooo on the fiduciary issue of bank notes, set by the act of 1928, was raised to £300,000,000; the assets (including gold) of the issue department were henceforward to be valued weekly, any excess or deficiency in comparison with the total of notes being adjusted by transfers to or from the exchange equalization account; and the profits of the department were to be paid to the same account instead of being brought into the budget as miscellaneous revenue.

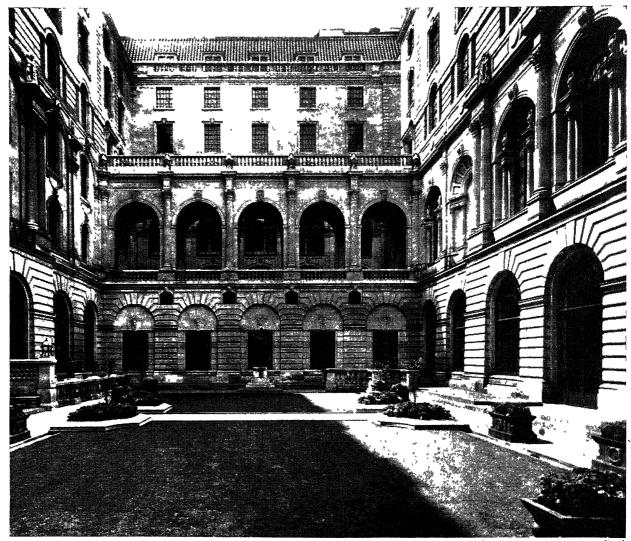

With the onset of war in Sept. 1939, the bank put into force plans which had been in preparation against such an eventuality. Apart from the raising of the bank rate, arrangements were made to provide additional currency if required and to protect the position of acceptors, on the lines of those improvised in Aug. 1914. World War II, however, had been so generally foreseen and the London market's commitments were so much less widely spread that virtually no recourse to them was necessary. Gold held in the issue department had fallen by £200,000,000 in Jan. 1939, on transfer to the exchange equalization account, of which £100,000,000 was restored in March, on the coming into force of the act referred to above. In Sept. 1939 most of the rest (£263,000,000) passed to the exchange equalization account, so that all resources were mobilized.

The effect of these movements can be seen in Table I, showing changes in the authorized limit of the fiduciary

issue, but the most striking feature was the enormous increase that took place as the inevitable result of wartime conditions, including not only a higher level of prices and earnings, but also full employment and increased mobility of the population as a whole.

These changes in the note issue were, of course, one result of the need to finance the war on which the bank, in its traditional capacity as the banker of the government, had to concentrate. While "small savings" were the responsibility of the National Savings committee and the post office savings bank, the initiation and management of the main borrowing program fell on the bank. Two novel weapons were developed: first, the offer of government securities "on tap," instead of by periodical issues each open for a short time only; secondly, the institution of treasury deposit receipts whereby the additional deposits of the commercial banks accruing as a result of government expenditure were reborrowed for six months directly by the treasury. An incidental result of wartime finance was an enormous increase in the volume of government debt to be managed by the bank.

*Including local loans and certain other guaranteed issues.

This burden was not eased by the prudent removal of all this part of the bank's work to more peaceful but remote quarters in Hampshire. The success of the borrowing program may be judged not only by the continued decline in rates of interest but also by the relatively small extent to which it had to be accompanied by a direct increase

The Bank of England was among the first institutions nationalized in Great Britain after the Labour party came to power in 1945. Shareholders were bought out in accordance with the bill passed in the house of commons on Dec. 19, 1945. This picture shows one of the inner courtyards of the bank building on Threadneedle St., London

in central bank credit. A summary of the bank return during the ten-year period will be found in Table III. This success must be attributed in part to the close working of the bank with all parts of the capital market, which—built up over past years—proved its worth in the ready mobilization of the natural patriotism of all those concerned.

But the most novel and far-reaching of the bank's wartime activities was the institution and operation of a system of exchange control, designed to ensure that all available supplies of gold and foreign currency were conserved for use in the war effort. The bank acted as agents for the treasury, with which daily contact was maintained as also with other government departments such as those responsible for the licensing of imports and exports. Gold and certain specified currencies had to be surrendered, and dealings were canalized through the bank or through other banks constituted as authorized dealers. Arrangements were made for calling in U.S. dollar and certain other securities; and dealings in other foreign securities had to be controlled. The bank entered into a series of agreements with central banks, for example, in South

America, covering the financing of essential wartime trade; agreements the smooth functioning of which owed a good deal to the collaboration established before the war. This co-operation particularly proved its worth in connection with what came to be known officially as the "sterling area." For decades the trade of most empire and some allied countries had been financed in sterling through London, where they were wont to keep at least a large part of their monetary reserves. On this traditional foundation was built a structure of exchange controls in these countries, acting substantially in line with that in the United Kingdom; so that within the fence thus created, trade and payments could be left untrammelled, but the allied countries in the sterling area could pool their resources of gold and scarce currencies for the common effort.

Nationalization.—For a century the bank had accepted the responsibilities of a central bank. Montagu Norman (later Lord Norman), whose governorship almost spanned the period between the end of World War I and the end of World War II, had created a new organization with a new outlook, fitted for the specific functions of a modern central bank, and this new organization was available when in 1931 the government of the United Kingdom suspended the gold standard.

In Oct. 1945 a bill was introduced into the house of commons to bring the capital stock of the Bank of England into public ownership and bring the bank under public control-"the first of the government's nationalization measures." It was passed on Feb. 14, 1946, and came into force on March 1, 1946. While the measure was the application of a general political principle to a particular case, the government was at pains to make the application with the least possible disturbance of existing practice, and to make it clear that this was its intention. The bill, said the chancellor of the exchequer, "in effect, brings the law into relation with the facts as they have gradually evolved over the years. . . . By this bill we ensure a smooth and efficient growth of our political and banking system, in order to meet the new needs of the future. . . . In one aspect, this bill only legalizes an actual situation." He went on to point out that "the relations between the Bank of England and the treasury have long been close, confidential, even intimate; and so they must continue."

The first clause provided for the transfer of the capital stock of the bank to a nominee of the treasury, and compensated the previous proprietors by an amount of government 3% stock which would yield them the same gross income as their dividends on bank stock had brought them annually in the previous 20 years. The second provided for the appointment of governor, deputy governor and directors by the crown; the number of directors was reduced from 24 to 16. Power was taken to revoke any or all of the provisions of the bank's charters "except in so

far as they incorporate the bank," and after the passing of the act a new charter was in fact granted, of a purely formal character. The only serious controversy arose over clause 4 of the bill, which (a) empowered the treasury to "give such directions to the bank as, after consultation with the governor of the bank, they think necessary in the public interest"; and (b) empowered the bank to request information from, and make recommendations to, bankers and, "if so authorized by the treasury, issue directions to any banker for the purpose of securing that effect is given to any such request or recommendation." The fears of critics were met by the provisos that (a) "no such request or recommendations shall be made with respect to the affairs of any particular customer of a banker"; and (b) "before authorizing the issue of any such directions the treasury shall give the bankers concerned . . . an opportunity of making representations with respect thereto."

Subject to any treasury directions, the affairs of the bank were to be managed by the court of directors in accordance with the provisions of its charters, and the chancellor expressly disclaimed any intention to interfere with the day-to-day administration of the bank's business.

A measure which transferred to the government of the day the power to appoint the governors and directors of the central bank had obvious potentialities of changed policies and changed relations; but within the limiting conditions of a measure to nationalize the bank, the government took reasonable precautions to safeguard the independence so essential in an institution on which it relied both for technical advice in the field of finance and the technical implementation of its credit policy. Its character as a self-governing and independently functioning corporation was preserved. While the power was explicitly taken to issue directions to the bank-a power which a government might well have exercised without specific legislation-the government spontaneously restricted itself to issuing such direction only "after consultation with the governor of the bank," which safeguarded his right and opportunity to offer independent advice. Again, the position of the bank as the channel by which the government would communicate with the other banks was safeguarded, and indeed strengthened. By implication the change in the position and functions of the bank and its organization for sustaining them was approved and confirmed; but the responsibility of the government of the day for the broad decisions of monetary and credit policy was formally affirmed, and the duty of the bank to respect the government's authority, instead of remaining a matter of convention, was ensured by a new constitution.

Baptist Church

A significant step was taken by many bodies within the Baptist World Communion by their decision to have representation in the Conference on Church, Community and State, at Oxford, 1937; the Conference on Faith and Order at Edinburgh, 1937 and the Utrecht Provisional conference on a World Council of Churches in 1938. At the Lausanne Conference on Faith and Order in 1927, the Northern Baptist convention (U.S.A.) and the Baptist Convention of Ontario and Quebec had delegates. In the later conferences the Southern Baptist convention (U.S.A.), the National Baptist convention (Negro, U.S.A.) and the Baptist Union of Great Britain and Ireland were also represented.

Baptists of Australia, South Africa and New Zealand found distance and expense too great for delegations. At the end of the decade 1937–46, the Southern Baptist convention had not yet decided to join the World Council of Churches, which had its inception in the Utrecht Provisional conference.

In July 1939, the sixth congress of the Baptist World Alliance was held at Atlanta, Georgia, with 12,000 registered delegates present. The executive committee of the Alliance meeting in Washington, D.C. in May 1946, decided to hold the seventh congress in Copenhagen, Denmark, in July 1947.

War engaged the attention of Baptists from 1939 to 1945. The American conventions could not be held, because of government restrictions, in 1943 or 1945. A markedly different attitude from that toward World War I was noticeable. Concerning World War II there were confessions of guilt, a sense of failure to have exercised fully the power of Christ throughout the world in ways of peace.

Although full support was pledged by the various conventions and unions to their respective governments in the prosecution of the war, the rights of conscientious objectors were defended and funds were apportioned for their support.

In spite also of extra burdens borne through the war years as citizens, Baptists in all lands extended their religious activities. Early in 1942 Australian Baptists forwarded well over \$1,000 and a large collection of clothing to the relief of their sister churches bombed in the British Isles and increased their missionary funds for advance in India and at home. In the following years, 1942-46, additional large donations were made to these causes.

The Baptist Union of Great Britain and Ireland, burdened with the expense of repairing their own church edifices, enlarged their missionary benevolences. In 1942, one of the worst years of England's blitz, the Ter-Jubilee of the Baptist Missionary society (organized to send William Carey to India, in 1792) was celebrated in London at

which time a commemoration fund of more than \$600.000 was raised. Again a self-denial week (Oct. 28-Nov. 4, 1945) was set apart for special gifts. A Victory Thanksgiving fund of some \$600,000 was endorsed for 1946—\$400,000 for local work and \$200,000 for reconstruction on the continent.

Because of financial strictures Canadian Baptists were compelled in 1938 to relinquish control of their Brandon college organized in 1898 at Brandon, Manitoba. Although its management passed into the hands of a local board, having affiliations with the University of Manitoba, Dr. J. R. C. Evans, a Baptist, remained as president.

In Dec. 1944 the Baptist Federation of Canada was formed, co-ordinating the three conventions, Maritime, Ontario and Quebec and the Union of Western Canada.

All Canadian Baptists took pride in the fact that the Riverside church of New York city, seeking a successor to their well-beloved and famous pastor, Dr. Harry Emerson Fosdick, extended a call on March 27, 1946, to Professor Robert James McCracken of McMaster university, Hamilton, Ontario, who accepted.

The Northern Baptist convention (U.S.A.) in 1942 added an emergency fund of \$600,000 to their normal budget of \$2,500,000, which total was exceeded by \$133,795. In 1944 the emergency fund was raised to \$2,000,000 and the annual budget to \$5,000,000. In 1945 the World Mission Crusade of \$14,000,000 was adopted for completion by April 30, 1947. The sum was set aside for missionary enterprises at home and abroad, the restoration of church buildings, schools and hospitals, extension of urban work, education and pension funds for ministers and missionaries. The grand total, with the annual budget, amounted to \$17,900,000.

The convention sessions, held at Grand Rapids, Mich., in May 1946, were attended by more than 5,000 delegates -the largest in its history of nearly 40 years. Encouraging achievements in missions were reported. Twenty-five missionaries were appointed in 1945-46 to home mission fields. Eighteen new missionaries were commissioned to the foreign field by the Conservative Baptist Foreign Mission society. The American Baptist, and Woman's, Foreign Mission societies expected to appoint 37 families and 20 single women to 10 fields in 1946. In April 1946, a cablegram was received by the American Baptist Foreign Mission society reporting that Shanghai university, China, maintained co-operatively by Northern and Southern Baptists, had returned with 900 students to its campus in Shanghai on Easter Sunday. The university had been forced into western areas of China at the outbreak of the war with Japan.

The Southern Baptist convention meeting in Miami, Fla., in May 1946, was attended by 7,800 messengers. In 1945 Southern Baptists contributed to all causes the large sum of \$98,500,000. The Woman's Missionary union raised \$6,517,322 for missions and education. Enthusiastically the convention voted to raise an extra \$3,500,000 for relief and rehabilitation in Asia and Europe by Sept. 30, 1946, of which amount \$17,000 was received during the sessions. It was recommended that the convention should "study the whole race situation" and a resolution was passed urging "the members of the churches of the convention to refrain from association with all groups that exist for the purpose of fomenting strife and division within the nation on the basis of differences of race, religion and culture."

The Scottish Baptists in 1944 raised a total of more than \$46,000 for foreign missions, an increase of more than \$5,000. In 1945 they supported more than 50 mis-

sionaries with 39 in active service and others awaiting passage.

For the year 1945-46 the Baptists of South Africa sought a Thanksgiving fund of more than \$60,000 for extension work among the English-speaking people rapidly moving into the frontier areas.

Dr. J. H. Rushbrooke, president of the Baptist World alliance, reported that in 1946 the Baptists of Britain were able to finance their own program for the first time after 1939. More Baptist church buildings were destroyed during World War II in Great Britain than were demolished in all of continental Europe. Though the war hindered the work of the alliance, the range of its contacts was enlarged. Baptists in invaded countries, such as Norway and The Netherlands, stood firm in their faith, their number actually increasing in Denmark. The seminary in Czechoslovakia, closed during the war, reopened. In Rumania, Baptists were recognized as a Christian communion with freedom of worship. Even in the U.S.S.R. conditions were encouraging.

World statistics for Baptists in 1941 (latest data available at the end of the decade) were as follows: Europe, 657,111; Asia, 585,810; Africa, 135,841; America, (North), 11,417,963; (Central and West Indies), 76,124; (South), 73,274; Australia and New Zealand, 40,774; total 12,986, 897. The 1946 total exceeded 13,000,000.

Barium Minerals

While direct consumption of barium minerals in the war program had little effect on demand, certain indirect uses contributing to the war effort made marked changes. There was a moderate increase in demand for barium chemicals, and a small increase in pigment uses, but the chief repercussion came from the petroleum industry, which greatly increased the amount of barite used in drilling mud. As the accompanying world production table shows, total output was little affected, but there were

World Production of Barite

heavy shifts in production. When Germany was cut off from export markets, production there declined to a fairly uniform level for home consumption. To offset the loss of the German exports, production increased elsewhere, especially in the United States, Canada and Great Britain.

In the United States production of barite rose from 360,877 short tons in 1937 to 692,330 tons in 1945, of which 407,871 was used in well-drilling as compared with 126,697 tons used for this purpose in 1938 (1937 figures not reported); the 284,459 tons left available for other uses in 1945 was an increase of only about 20% over the prewar level. U.S. imports, mainly crude barite, but including a few thousand tons each of ground barite, witherite and barium chemicals, totalling 79,411 tons in 1937. had declined to 660 tons in 1943, but recovered to 57,826 tons in 1945. The only barium product in which the United States had an appreciable export trade was lithopone, which expanded from 2,671 tons in 1937 to 21,527 tons in 1941, but declined to 11,576 tons in 1945.

Outside the United States, the most spectacular increase in barite output was in Canada, where a first production of 338 tons in 1940 grew to 140,198 tons in 1945, mostly from Nova Scotia.

The British output, including both barite and witherite, showed only a moderate increase. Witherite (barium carbonate) was commercially produced only in England.

Barkley, Alben William

Barkley (1877—), U.S. senator, was born Nov. 24, 1877, in Graves county, Ky., the son of a tobacco farmer. He was graduated in 1897 from Marvin college at Clinton, Ky., with a B.A. degree, later studying at Emory college in Georgia and the University of Virginia law school. Elected to the U.S. house of representatives in 1912, he was re-elected six successive times. In 1926, he was elected to the senate and was re-elected in 1932, 1938 and 1944.

A loyal administration supporter, Barkley was instrumental in getting the support of his senatorial colleagues for the Selective Service and Lend-Lease bills and also sponsored the amendments to the Neutrality act which passed the senate in Nov. 1941. In 1944 he broke his record of 11 years of uninterrupted support of the New Deal and charged (Feb. 23) that President Roosevelt's veto message on the tax bill was "a deliberate assault" upon the integrity of congress. After delivering this angry protest, Barkley resigned as leader of the senate. Roosevelt hastily disavowed any intention of slurring the integrity of congress and urged Barkley to reconsider his resignation. Both houses of congress overrode the president's veto, and on Feb. 24, Barkley was unanimously reelected to senate leadership by a Democratic senate caucus.

When congress decided to investigate the Pearl Harbor incident, Barkley was named (Sept. 18, 1945) chairman of the committee of inquiry. The committee published its conclusions on July 20, 1946, and Barkley signed the majority report which asserted that Roosevelt and his three principal cabinet members at the time—Cordell Hull, Henry Stimson and Frank Knox—did not "incite" or "cajole" Japan into attacking Pearl Harbor. In 1946 Sen. Barkley was one of the principal administration supporters who helped get congressional approval of the U.S. loan of \$3,750,000,000 to Britain.

Barley

World barley production was about 2,332,000,000 bu. in the prewar decade, and some increase was reported during the following years. After the outbreak of World War II, barley production was increased in the United Kingdom by plowing pasture lands. In Canada, barley was sown in place of wheat when the latter was in surplus supply at the beginning of the war. Canadian production in 1942 was 259,000,000 bu. compared with 110,000,000 bu. in 1941, and an average of 88,000,000 bu. in 1935-39. Before the war, Germany was the principal barley producer of Europe, followed by Spain and Poland. Turkey, India, Japan and China were also important producers.

Production of barley in the United States increased steadily from a low point of 117,390,000 bu. in 1934 to a record crop of 429,167,000 bu. produced in 1942. Thereafter the acreage and production declined, and the 1945 crop of 263,961,000 bu. was the smallest after 1938. The inability of barley to compete with other crops brought the decline, though prices were double those of prewar. Reduced acreage accounted for the shrinkage in the crop: yields in 1945 were the highest after 1915 and above the ten-year average of 22.3 bu. per acre.

The larger part of the U.S. barley crop continued to be used as livestock feed, while next came the making of malt for alcoholic beverages. Barley prices remained fairly steady through the decade 1937-46 until 1943, when an increase of more than 50% was recorded. Barley prices rose nearer to those of corn, and in the spring of 1946 the two were exactly the same, \$1.16 per bushel. The production of barley was giving way to oats in the U.S. corn belt, since improved varieties of the latter grain were giving better returns. In the central states, corn and oats were crowding out barley, although the latter was still a more reliable crop than corn in the northern plains.

*Preliminary Estimate.

Barley became an export crop about 1891, and the U.S. continued to have a balance of exports until 1934 ranging from 5% to 12% of the annual crop. One exceptional high point was in 1919, when exports amounted to 25% of the rather small crop of that year. In 1937, net exports amounted to 5.4% of the crop of 220,327,000 bu. U.S. needs for feed increased thereafter; net imports for 1942 were 25,067,000 bu. and for 1945, 38,002,000 bu., principally from Canada.

BIBLIOGRAPHY.-For statistics of production, see U.S. Dept. of Agric., Agricultural Statistics; Handbook of Official Grain (J. C. Ms.) Standards (1941).

Barros Camara, João de

), Brazilian prelate, was Cardinal Barros (1894born Aug. 3, 1894 at São José, state of Santa Catarina, Brazil. Educated at the Jesuit seminary of São Leopoldo, he was ordained in Jan. 1920, served as rector of the diocesan seminary and was made bishop of Mossoro in 1935. Consecrated archbishop of Belem do Pará in 1940, he was transferred to the see of São Sebastião do Rio de Janeiro in 1943. The archbishop, regarded as an able organizer, orator, historian and administrator, was active in developing seminaries and charitable works. He also engaged in extensive research in the history of the Roman Catholic Church in Brazil. His appointment to the Sacred College of Cardinals was announced Dec. 23, 1945. The Archbishop was proclaimed a cardinal at a consistory in Rome on Feb. 18, 1946.

Baruch, Bernard Mannes

Baruch, (1870-), U.S. financier and government official, was born Aug. 19, 1870, in Camden, S.C., the son of a Confederate surgeon. He moved to New York city at the age of 12, and later attended City college of New York. Interested in finance, he became successively a customer's man and speculator in Wall street, amassing by the time he was 42 years old a fortune estimated at between \$12,000,000 and \$15,000,000.

In 1916 he went to Washington, D.C., at President Woodrow Wilson's behest to become a civilian member of the Advisory Commission of the Council of National Defense. Made head of the War Industries board in March 1918, Baruch was given virtually dictatorial authority over U.S. war production. He left his post in Jan. 1919, and went with President Wilson to the Versailles conference in the capacity of economic adviser.

Between wars, Baruch resumed his financial operations but after the outbreak of World War II he headed a committee investigating the rubber crisis. He returned to government service in June 1943 as adviser on industrial production to the personal staff of James Byrnes, then OWM director, serving without title or salary. On Sept. 17, 1943, Baruch recommended a labour pool to meet the man power crisis. Byrnes later named Baruch to head a new unit established within the OWM to deal with adjustments in war production and postwar reconversion.

After the collapse of Germany, Baruch recommended that German industry be dismembered and that the Germans be permitted to produce only essentials for their own use. Baruch was named by President Truman as U.S. delegate on the United Nations Atomic Energy commission on March 18, 1946. Three months later he submitted (June 14) to the latter body the U.S. proposal for international control of atomic energy. The plan was criticized by left wing and liberal elements in the United States, particularly by Secretary Henry Wallace, who asserted that the U.S. desired to dictate the steps leading to international control of atomic energy. Baruch charged on Oct. 2, 1946, that Wallace's statement to President Truman on the subject not only contained five errors of fact but that his interpretation of the Baruch plan could seriously impair its support by U.S. public opinion.

Baseball

Organized baseball's seventh decade of history, which coincided almost exactly with the eventful years of 1937 to 1946, furnished its followers with the most exciting parade of moments that the great game had ever known. In baseball, as in world affairs, it was an era featured by revolutionary happenings, unexpected sensations and grim tragedies.

Despite the obviously necessary curtailment caused by World War II, baseball emerged from the period with a record-shattering attendance, a strong system of minor leagues to feed talent to the major circuits and a host of promising players.

It was the era in which Johnny Vander Meer, Cincinnati's proud young southpaw, spun his two consecutive no-hit games, an unparallelled feat. It saw also the final dissolution of the 2,130 consecutive game string played by Henry Louis Gehrig, and later the untimely death of that great player. It witnessed the tremendous growth in popularity of baseball played at night; the setting aside of Cooperstown, N.Y., as the pastime's shrine; the signing of Negro players to end at long last the game's unwritten policy of Jim Crowism; the 56-game batting streak of the Yankee Clipper, Joseph Paul DiMaggio; the first playoff to decide a pennant in 71 years of major league history; and numerous other events touched with

It is axiomatic that baseball provides rapid changes, and no better indication of this condition can be given than to cite the managerial structure of the game at the beginning of the era and at its close.

Managers.—At the start of the 1937 season, the 16 major league clubs took the field guided by the following managers:

National League Boston-William B. McKechnie Boston-Joseph E. Cronin Brooklyn-Burleigh A. Grimes Chicago-Charles J. Grimm Cincinnati-Charles W. Dres-New York-William H. Terry

Philadelphia-James Wilson Pittsburgh-Harold J. Traynor St. Louis-Rogers Hornsby St. Louis-Frank F. Frisch

American League Chicago-James J. Dykes Cleveland-Stephen F. O'Neill Detroit-Gordon S. Cochrane New York-Joseph V. McCar-

thy Philadelphia-Connie Mack Washington—Stanley R. Harris

Of these 16 managers, only two—the patriarchal Connie Mack and Joseph E. Cronin-remained at the head of their clubs throughout the decade. Mack, of course, an owner of the Philadelphia franchise, was as solidly entrenched there as the Liberty Bell. Once winner of the Bok award for outstanding service to Philadelphia, Mack had piloted the destinies of the club ever since the founding of the American league.

A third man, Charles J. Grimm, was the manager of the Chicago Cubs at the end of the era, just as he was at the start. But his service with the club had been interrupted by managerial reigns of Charles L. Hartnett and James Wilson.

For the others, the fates had all sorts of things in store. Burleigh Grimes served just two seasons with Brooklyn, and then remained in the game to boss various minor league clubs. His place at Brooklyn was taken by Leo Durocher, a fiery, latter-day John J. McGraw, who brought to the proud borough of Brooklyn the days of its greatest grandeur.

Bill McKechnie moved to Cincinnati in 1938, and moulded championship clubs in 1939 and 1940. Then a decline set in, and in Sept. 1946 he announced his retirement, moving to Cleveland to serve as coach in 1947 under Manager Lou Boudreau. McKechnie's place was taken at Cincinnati by John Neun, famed as one of seven men in all baseball history to execute an unassisted triple

Dressen, Cincinnati manager in 1937, moved on to Brooklyn, where he served as an aide to Durocher.

Terry, Traynor, Cochrane and Hornsby-four of the most glowing names in the annals of the pastime, left the game entirely. Terry was succeeded at New York by Melvin Thomas Ott, whose playing career with the Giants extended over two decades. Traynor, succeede at Pittsburgh in 1940 by Frank Frisch, retired to do sports work on the radio. Cochrane brought Detroit a pennant in 1934 and a world's championship in 1935, but gave way in 1938 to Del Baker, who in turn yielded to Steve O'Neill. Hornsby, long a stormy petrel in the game's affairs, left the Browns early in 1937. His departure was the signal for a succession of Brown managers: Jim Bottomley, Charles "Gabby" Street, Fred Haney and Luke Sewell. Under Sewell the Browns in 1944 achieved their first and only championship.

Wilson, manager of the Phils in 1937, tasted almost every sort of fortune in the years that followed. He moved to Cincinnati as a coach under McKechnie in 1939, and when a series of circumstances made it necessary he resumed his career as an active player, going behind the bat in the world series of 1940. His striking performance in that role, made under the most difficult of circumstances, won for him the job of managing the Chicago Cubs. For three years and part of a fourth Wilson remained in Chicago. Then he resigned and resumed his coaching chores for the Reds.

Dykes remained at Chicago for most of the decade, leaving in 1946 to pilot the Hollywood club of the Pacific Coast league. Harris, succeeded in Washington by Ossie Bluege in 1943, served a brief and tumultuous hitch as pilot of the Phillies, and finally joined the New York Yankees in 1946 in an executive capacity.

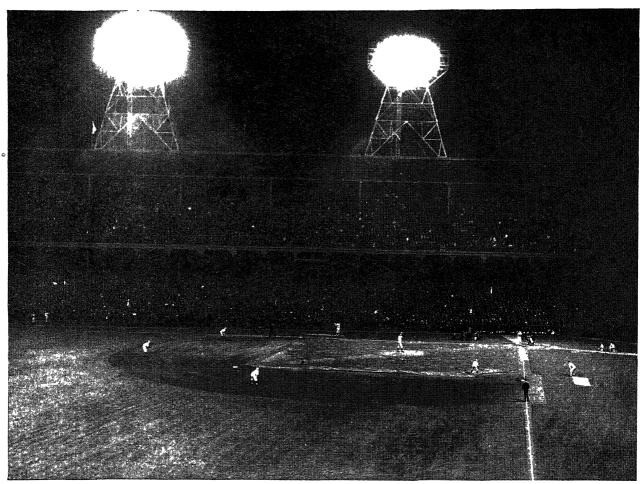

But perhaps the most brilliant record of the decade was set by a manager who was not even in the majors when 1937 started. That man, William H. Southworth, won three successive pennants for the St. Louis Cardinals in 1942, 1943 and 1944. Then, after finishing second at St. Louis in 1945, he moved on to Boston, where he raised the once hapless Braves from sixth to fourth place.

The peregrinations recorded above testify to the ephemeral character of baseball's structure, but even more startling were the numerous changes in club ownership which brought new capital and new hopes to the thousands of fans in the cities affected. No less than seven major league clubs changed hands during the period, as follows:

The New York Yankees, who achieved fabulous success under the ownership of Colonel Jacob Ruppert and the guidance of Edward G. Barrow, were sold to a syndicate headed by Leland S. "Larry" MacPhail, former general manager at Cincinnati and Brooklyn; Dan Topping, wellknown sportsman; and Del Webb, former player and businessman. MacPhail, who used startling methods to jack up attendance at Cincinnati and Brooklyn, pursued the same policies at New York and was rewarded in 1946 with the largest attendance ever recorded by a club.

After winning a pennant in 1944, Donald L. Barnes, president of the St. Louis Browns, announced the sale of his stock to Richard C. Muckerman, who became president.

Alva Bradley, president at Cleveland after 1928, sold out

John Vander Meer of Cincinnati pitched his second successive nohit game—a world's record—at Brooklyn on June 15, 1938. This game was the first night contest played in Brooklyn

to a syndicate headed by William Veeck, son of the former president of the Chicago Cubs and a showman of the MacPhail pattern. Veeck assumed the reins in mid-season, 1946, and almost immediately obtained results.

Pittsburgh, which for 47 years had been owned by the Dreyfuss family, changed hands in 1946, with Frank E. McKinney, an Indianapolis banker, succeeding William E. Banswanger as president. The sale of the Cleveland and Pittsburgh clubs brought two well-known theatrical names into the baseball scene. Singer Harry "Bing" Crosby was associated with the group which took over the Pittsburgh franchise, and comedian Bob Hope was among those who invested with Veeck at Cleveland.

The Philadelphia Phils went through two changes of ownership. Gerald Nugent, president for ten years, sold out in 1943 to William D. Cox; and before the year was out the club was acquired by youthful Robert R. M. Carpenter, Jr., whose investments merited the team's improvement. The Phillies emerged from the league basement in 1946 to finish fifth, the highest vantage point they had succeeded in reaching since 1932.

The Boston Braves, for ten years piloted by Robert Quinn and his son, John, were purchased by a group headed by Louis R. Perini, Guido L. Rugo and Joseph Maney. Perini, as president, pulled a master stroke in securing William H. Southworth as manager of the club.

Branch Rickey, who served the game in almost every possible capacity, moved from the St. Louis front office to take over as Brooklyn president in 1943.

As far as what actually took place on the diamond was concerned, the era was featured by the tremendous strength of the Brooklyn and St. Louis teams in the National league, and the continued dominance of the American by the New York Yankees. The table below shows the pennant winners in each league for the years considered:

	National	League	:	•	American i	League:	
Year	Champion	Won	Lost	Pct.	Champion	W. L.	Pct.
1937	New York	95	57	.625	*New York		
1938	Chicago	89	63	.586	*New York	99 53	_
1939	Cincinnati	97	57	.630	*New York	106 45	.702
1940	*Cincinnati	100	53	.654	Detroit	90 64	
1941	Brooklyn	100	54	.649	*New York	101 53	.656

1946	*†St. Louis	98	58	.628	Boston	104 50	.675

*World Series winner and world champion. †Victors over Brooklyn in National league playoff.

World Series Play.—Baseball interest reaches its apex annually at the time of the world series. Since 1903 (officially since 1905) the champion teams of the National and American leagues contended in a series of games to determine the champions of the world. This annual classic has long been celebrated as the crowning event of the sporting world, and as it continues each year its traditions grow. Here, in essence, are the results of the world series from 1937 through 1946.

New York Giants vs. New York Yankees

Hall of Fame.—The origin of the game of baseball had long been obscure, and fans long argued whether the game was a descendant of the British pastime of rounders or whether it had been developed as purely an American sport.

As early as 1905, major league officials appointed a commission to study the matter. This commission re-

Scene during the second game of the 1944 World Series. Don Gutteridge, second baseman for the St. Louis Browns, has just struck out. The St. Louis Cardinals won the game and took the series four days later, four games to two

ported its findings in 1908 and concluded that baseball was an American invention and that the inventor, Abner Doubleday, laid out the first diamond at Cooperstown, N.Y., in 1839. Doubleday, in 1839 a cadet at West Point, later became a major general in the Civil War.

Baseball, then, officially celebrated its Centennial at Cooperstown in 1939, with a series of games between major league clubs, college and amateur teams. A Hall of Fame had been erected to house various relics of baseball, including a baseball made by Doubleday himself.

Elections to the Hall of Fame were made annually by a vote of the Baseball Writers' Association, and other notable figures were appointed to the place of honour by the Centennial Commission. Twelve players were almost immediately chosen for membership, and each of them was honoured by a bronze plaque. The first selections were:

Christy Mathewson.—This great righthanded pitcher of the New York Giants won 373 and lost 189 games in his career, which extended over 17 seasons, from 1900 to 1916. He was born at Factoryville, Pa. on Aug. 12, 1880, and died at Saranac Lake, N.Y., on Oct. 7, 1925. A Bucknell college boy, Matty had only two years of professional experience when he joined the Giants in 1900. He became a winning pitcher immediately, and first reached greatness in the 1905 world series, when he pitched three shutouts against the Philadelphia Athletics. He was noted for his control pitching and for his "fadeaway" curve. He won 30 or more games a year in four different seasons, and 20 or more in 10 others. He was traded to the Cincinnati

Reds in July 1916, and managed that club through 1918, leaving to go overseas as a captain in the Chemical Warfare division of the army in World War I.

Walter Johnson.—Generally accredited as the fastest pitcher who ever lived, Johnson toiled on the mound for Washington for 21 seasons and won the amazing total of 413 games, losing only 280. Many of the teams for which he pitched were second division outfits, but Johnson was practically unbeatable. He won 20 or more games a season 12 different times, and twice won 30 or more. In his career he won a total of 113 shutout games. Johnson was born at Humboldt, Kan., on Nov. 6, 1887, and was a righthander. After finishing his career as an active player, he managed Washington from 1929—32 and Cleveland from 1933 until August, 1935.

Ty Cobb.—Usually referred to as the greatest player of all time, Cobb joined the Detroit Tigers in 1905 and stayed in the major leagues for 24 years. During that time he set a total of 90 records, many of which still stood in 1946. He played more games, went to bat more times, scored more runs, made more hits, had more total bases, and stole more bases than any player who ever lived. He was known for his aggressive type of play, and was frequently involved in fights on the field. He won the American league batting championship twelve times, nine times in a row. He left a major league batting average of .367 for 24 seasons. Cobb was born at Banks County, Ga., on Dec. 18, 1886. He was a lefthanded hitter but threw with his right hand. He managed Detroit from 1921 through 1926 and then closed his career as an active player in 1927 and 1928 with the Philadelphia Athletics

Babe Ruth.—The home run was not the invention of

Babe Ruth, but he popularized it to such a degree that it revolutionized the game. Ruth was the greatest home run hitter in history, but was also an excellent lefthanded pitcher during his early days, and pitched 29 consecutive innings in World Series play without being scored upon. Ruth, who was born at Baltimore, Md., on Feb. 6, 1895, was a lefthanded batter. He came up as a pitcher with the Boston Red Sox in 1914, but proved to be such a powerful batsman that he was used in the outfield when he was not pitching. He was first recognized as a home run hitter in 1919, when he knocked out 29, a remarkable total for those days. He increased the number to 54 in 1920, 59 in 1921, and reached his high of 60 in 1927. Before he retired in 1935, Ruth smashed 714 home runs, in addition to 15 more in world series competition. If he was not so great a player as Cobb, he was the more dramatic, and no player had ever been more widely known.

Honus Wagner.—Born at Carnegie, Pa., on Feb. 24, 1874, Wagner became the game's greatest shortstop, although he was equally at home at other positions. He reached the majors with Louisville in 1897 and when the National league reduced its clubs from 12 to 8 in 1900, Wagner was shifted to Pittsburgh, where he reached his greatest fame. He led the National league in batting eight different seasons, and frequently led the league in two base hits, three base hits, runs scored and hits. Wagner never managed a big league club, and when he retired in 1917 he left the game entirely until 1933, when he returned to Pittsburgh as a coach.

Nap Lajoie.—This stylish second baseman was a French Canadian, born at Woonsocket, R.I., on Sept. 5, 1875. He started his career with the Philadelphia club of the National league in 1896, but spent most of his career in the American league, with Philadelphia in 1901 and with Cleveland from 1902 to 1914, going back to Philadelphia to close his career in 1915 and 1916. Lajoie led the American league in hitting in 1901, 1903 and 1904. Ty Cobb overshadowed him after that. He batted for a mark of .405 in 1901. He managed Cleveland from 1904 to 1909, and after he left the majors he piloted the Toronto and Indianapolis clubs.

Tris Speaker.—Known principally for his defensive play, Speaker was nevertheless a clever batter; he left a mark of .345 for 22 major league seasons. He also hit a total of 793 two-base hits, more than any other player ever accumulated. But it was in the outfield that the "Grey Eagle" chiefly attracted attention. Extremely daring, he played a very shallow centrefield, often catching balls that would ordinarily have fallen for hits. Twice in one season he executed unassisted double plays, a remarkably rare feat for an outfielder. Speaker was born at Hubbard City, Tex., on April 4, 1888, and reached the American league with Boston in 1907. Traded to Cleveland in 1916, he remained with the Indians for a decade, and closed his career with Washington in 1927 and Philadelphia in 1928, where he was a teammate of Ty Cobb's. Speaker managed Cleveland from 1919 to 1926, and served as that club's pilot when it won the 1920 world series from Brooklyn. He led the American league in batting in 1916, the year that Ty Cobb missed.

Cy Young.—Denton True Young took part in 906 major league games, winning 510 and losing 313. Young joined Cleveland of the National league in 1890 and pitched in the majors for 22 years. He went from Cleveland to St. Louis in 1899, then joined the Boston Red Sox in 1901, moved to the Cleveland Americans in 1909 and closed

his career in 1911 with the Boston Nationals. Young won 20 or more games per season 16 times, and passed the 30-mark on five occasions. He pitched two no-hit games, one of them a perfect contest with not one opposing batsman reaching first base.

Grover Alexander.-First pitcher selected for the Hall of Fame after Mathewson, Johnson and Young, Alexander won exactly the same number of games as Mathewson, 373, and did his pitching in a later era. He joined Philadelphia of the National league in 1911, moved to the Cubs in 1918, to the Cardinals in 1926 and closed his career with his old team, the Phillies, in 1930. The record book was dotted with pitching feats of Alexander. He turned in four one-hit games in a single season (1915); hurled a total of 90 shutouts, 16 of them in one year (1916); and twice pitched two games in one day. But he reached the heights in the world series of 1926, when he trudged to the mound as a relief hurler in the seventh and deciding game, struck out Tony Lazzeri to throttle a seventh inning rally of the New York Yankees, and saved the game and series for the Cardinals. Alexander won 28 games his first season in the league. Most of the records for longevity held by Johnson in the American league were held by Alexander in the National.

George Sisler.—One of the foremost first basemen of history was George Sisler, whose career was blighted by sinus trouble when he was at the height of his fame. Sisler started with the St. Louis Browns in 1915. Born at Manchester, Ohio, on March 24, 1893, he was a graduate of the University of Michigan, where he had been a pitcher.

As a batter, Sisler was outstanding, and he twice reached the .400 mark, hitting .420 in 1922. He managed the Browns in 1924, 1925 and 1926, and closed his major league career with the Boston Braves, retiring in 1930. His mark of 257 base hits in a single season (1920) still stood in 1946. He was a lefthanded hitter and thrower.

Eddie Collins.—A second baseman, as was Lajoie, Collins played in the American league for 25 years, a mark for durability which he shared with Shortstop Roderick Wallace. A graduate of Columbia university, he joined the Philadelphia Athletics in 1906, was sold to the Chicago White Sox in 1915, and went back to the Athletics in 1927, retiring after the 1930 season. He managed the White Sox in 1925 and 1926. In 1933 he became vice president, treasurer and business manager of the Boston Red Sox, one of the few players to go from the diamond to the front office. Nine times Collins led the American league in fielding, and he made a total of 511 sacrifice hits—an American league record. Collins was born at Millerton, N.Y., on May 2, 1887. He threw righthanded, but was a lefthanded hitter.

Willie Keeler.—Author of the batting advice to "hit 'em where they ain't," Keeler, one of the original Baltimore Orioles, extended his career with New York in the American league until 1910, retiring with a .345 mark for 19 seasons. A lefthanded batter and thrower, Willie stood only 5 ft., 4½ in. in height and weighed a mere 149 lb. He was generally considered the most scientific hitter of all time. It was his record of hitting safely in 44 consecutive major league games that Joe DiMaggio finally succeeded in smashing. Keeler made his record in 1897. He was born at Brooklyn on March 13, 1872, and died there on January 1, 1923. Eight times during his career he made 200 or more hits in a season, a feat surpassed only by Cobb, who did it nine times.

In addition to the above players, the Centennial commission named the following men as deserving of niches in the Hall of Fame for services apart from playing the game: George Wright, Morgan G. Bulkeley, Ban Johnson, John McGraw, Connie Mack, Henry Chadwick and Alexander Cartwright. Wright was captain of the unbeaten Cincinnati Red Stockings of 1869, the first professional team. Bulkeley was the National league's first president; and Ban Johnson, a former Cincinnati sports writer, was the founder of the American league. McGraw and Mack, of course, were the game's most famous managers—McGraw with the Giants, Mack with the Philadelphia Athletics. Henry Chadwick was one of the game's first writers and historians, a man who invented the box score and codified the rules of scoring games. Cartwright organized the first club, the Knickerbocker Club of New York, in 1845.

After the first selections to the Hall of Fame were made, annual balloting took place to admit others. By the end of 1946 the following additional players had been admitted:

Adrian Anson.—This famous first baseman played National league ball from the circuit's first season, 1876, through 1897, a total of 22 years. Counting the five years of professional baseball which he played from 1871–75 in the National association, his career spanned 27 seasons, more than any other performer ever played. Anson managed Chicago from 1879 to 1897, and also managed the New York Nationals briefly in 1898. Born at Marshalltown, Iowa, on April 11, 1852, he died at Chicago on April 14, 1922. He was the batting leader of the National league

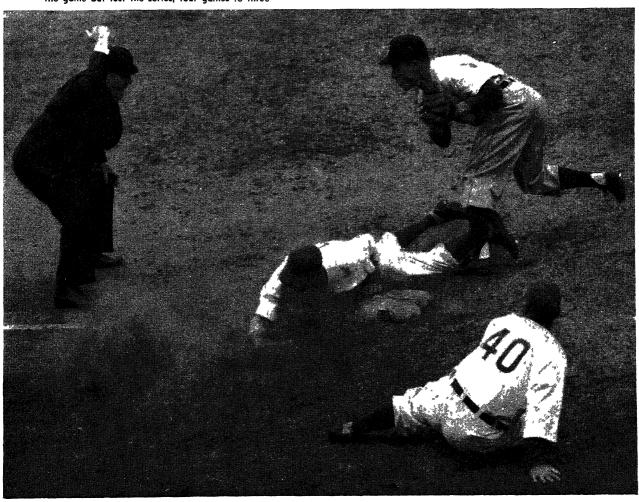

Roy Hughes of the Chicago Cubs being called out at third base in the sixth game of the 1945 World Series. The Chicago Cubs won the game but lost the series, four games to three

for four seasons and hit .300 or better for 20 years. He was a righthanded batter and thrower.

Elected to Hall of Fame membership at the same time as Anson was Henry Louis Gehrig, whose achievements will be considered at another place in this article. Also elected were five famous old-time players, as follows:

Albert Spalding.—One of the game's early pitchers, Spalding had just about concluded his career when the National league was founded. He pitched for the Forest City club of Rockford, Ill., from 1866 to 1870, then hurled for Boston of the National association for five seasons. His last pitching was done for the Chicago Nationals in 1876 and 1877. He won 56 games and lost just 4 for Boston in 1875. From 1882 to 1891 he was owner of the Chicago club, and he founded A. G. Spalding & Bros. in 1876.

Charles Comiskey.—"The Old Roman," as Comiskey came to be known, was the first player to rise to the ranks of club owner. He was first heard of as a first baseman for the St..Louis club of the American association from 1882 to 1889, serving as manager the last six seasons and winning four consecutive pennants from 1885 through 1888. He managed Cincinnati from 1892 to 1894 and then helped in the expansion of the Western league, which eventually became the American. Comiskey was president of the Chicago Americans from 1901 until his death in 1931. As a first baseman he had revolutionized play by staying close to the base only when it was occupied. Prior to him, first basemen had hugged the base at all times.

William Ewing.—"Buck" Ewing was said to have been the greatest catcher of his era (1880–1897) but he was also at home at other positions, and even did some pitching. He was a remarkable batsman, and did most of his hitting for the New York Giants, for whom he performed from 1883 through 1892. Ewing was born at Hoaglands, Ohio, on October 27, 1859, and died at Cincinnati on Oct. 20, 1906. He managed the Cincinnati Reds from 1895 through 1899. He was a righthanded batter and thrower.

Charles Radbourne.—The events of just one season assured "Old Hoss" Radbourne of a place in the Hall of Fame. In 1884, while pitching for Providence, he won 60 games and lost 12, 18 of his victories being consecutive. When the Providence team disbanded after the 1885 season, Radbourne was awarded to Boston, and he continued as a major league hurler through 1891. A graduate of Illinois Wesleyan, Radbourne was one of the first college players. He won 308 games in the majors and lost just 191.

W. Arthur Cummings.—Many players had laid claim to having been the first to have thrown a curve ball, and the honour seems to belong to William Arthur Cummings, who was elected to the Hall of Fame for that reason. Cummings, as a young boy at Ware, Mass., was said to have obtained the idea for the curve from watching the flight of clam shells which he threw. Cummings' claim was endorsed by Henry Chadwick, the game's Boswell. Cummings was at his best in National association days (1871–1875) and did little pitching after the National league came into existence. He died at Toledo, Ohio, on May 17, 1924. His playing weight was only 120 lb.

Three years elapsed before another player was admitted to the Hall of Fame. Then, in 1942, Rogers Hornsby secured enough votes to gain admission.

Rogers Hornsby.—Veteran of 23 years in the big show, seven times a batting champion, manager of four of the five clubs for which he played, Rogers Hornsby hit for the incredible average of .400 over a five year period. A righthanded batter and thrower, Hornsby was the hardest hitter the National league had ever seen. He came to the majors with St. Louis in 1915 and led the league in batting for the first time in 1920. He repeated for the next five years, and also again in 1928, when he was a member of the Boston club. His high mark was .424 in 1924, and he also hit .401 in 1922 and .403 in 1925. As a manager he led the Cardinals to their first pennant and world championship in 1926, and also piloted the Boston Braves, Chicago Cubs and St. Louis Browns. Hornsby was born at Winters, Tex., on April 27, 1896. He made 200 or more hits in a season seven times.

In 1945, ten more old-time players were admitted by special vote. These included:

Wilbert Robinson.—Only player ever to make seven hits in a single game. Famous catcher for the Baltimore Orioles and later manager of the Brooklyn Dodgers.

James Collins.—Top-notch third baseman of the game's early days, Collins left a batting mark of .294 for 14 seasons of major league play. He managed the Boston Red Sox from 1901 to 1906.

Hugh Jennings.—Manager of the Detroit Tigers and various other clubs, Jennings was one of the first of the great shortstops. He led the circuit in fielding for five consecutive seasons. Jennings managed clubs up until 1920. His playing fame was secured with the old Baltimore Orioles.

Fred Clarke.—A manager for two decades, Clarke played the outfield in the majors for 21 years, hitting .315. He

piloted Louisville from 1897 to 1899, and Pittsburgh from 1900 to 1915.

Hugh Duffy.—The highest batting average ever achieved in a season, .438, was hit by Hugh Duffy in 1894 for Boston. He played 17 years in the majors and left a batting average of .330. He later managed the Philadelphia Nationals, Chicago White Sox and Boston Red Sox, for whom he was still active as a coach in 1946.

Roger Bresnahan.—This famous catcher was also the inventor of the shin guard, an accepted part of catching equipment. At New York, he was the battery mate of Christy Mathewson, for whom he played during most of his career. He managed the St. Louis Cardinals from 1909 to 1912, and the Chicago Cubs in 1915.

Dan Brouthers.—First baseman and one of the early game's great hitters, Brouthers left a batting mark of .348 for 17 seasons of play. He participated in games for six different National league clubs from 1880 to 1896.

Ed Delehanty.—One of four brothers who played major league ball, Ed Delehanty was a powerful hitter. His career extended from 1888 to 1903, and he splashed 2,593 hits on the major league scene.

Jim O'Rourke.—"Orator Jim" O'Rourke was one of baseball's early durables. He was in the National league when hostilities began in 1876, and was still around 22 years later. He was an outfielder, first baseman and catcher. He also served as manager of Buffalo and Washington when those clubs were in the National fold.

Mike Kelly.—One of the most picturesque players of history, Michael Joseph "King" Kelly created a sensation when his contract was sold for \$10,000, a fabulous sum for the 1880s. He played with Chicago, Boston and Cincinnati, managing in the Players' league of 1890 and the American association of 1891.

After the admission of these ten men, the famed double play combination of Tinker to Evers to Chance (Joseph Tinker, John Evers, Frank Chance) was admitted as a unit. In the early days of the century this agile trio brought joy to the followers of the Chicago Cubs and despair to their opponents through their agile infield work. But double plays were not recorded at that time, and the number they made was not known.

Record-Makers of the Decade.—Professional baseball's seventh decade was also notable for the number of record performances which were made.

First there was the consecutive game record of Lou Gehrig, which was to end in tragedy. Henry Louis Gehrig, born in New York City, attended Columbia University and then joined the New York Yankees. He was farmed out three times to Hartford, but appeared in a few games for the Yanks in 1923 and 1924. On June 1, 1925, he started his string of 2,130 games without missing one, a streak which carried along up to May 2, 1939. Prior to Gehrig's mark, the record had been 1,308 consecutive games played by shortstop Everett Scott.

Gehrig's streak was stopped at his own request, when he told Manager Joe McCarthy, "You'd better put (Babe) Dahlgren on first today. I'm not doing the club any good out there." It was not known at that time that he had contracted amyotrophic lateral sclerosis, a hardening of the spinal cord. But Gehrig never played again. He remained with the club as non-playing captain, handing the line-ups to the umpire each day. In June of that year he was examined at the Mayo Clinic, Rochester, Minn., and the nature of his ailment was revealed to the public. He was in uniform for the last time when the Yankees took the field against Cincinnati in the World Series of 1939. He died at Riverdale, N.Y., on June 2, 1941.

The record book was well sprinkled with Gehrig accomplishments other than his consecutive game record. He batted in 184 runs in a single season, hit four home runs in a game, led the league in games played eight years, batted in 150 or more runs in a season seven times. and hit a total of 494 home runs (not a record), 23 of them with the bases filled. Four times he was named the most valuable player in his league, and he participated in seven world series and six all-star games.

Another record-maker of epic proportions was Melvin Thomas Ott, who joined the New York Giants in 1926 when he was 17 (actually Ott was with the club in 1925 but did not appear in any games), and under the careful schooling of John McGraw grew to become one of the National league's greatest players. A lefthanded hitter, Ott soon learned to answer the friendly and beckoning rightfield stands at the Polo Grounds and he became a famed hitter of home runs. Prior to Ott, most of the record performances in the National league had been made by Honus Wagner and Rogers Hornsby, and in the latter stages of his career he systematically started to smash them. Through 1946 Ott had scored more runs, collected more total bases, made more extra bases on long hits, more extra base hits, more home runs, more bases on balls and more runs-batted-in than any player in National league annals. The following list shows the old National league record, made prior to Ott, and Ott's record through 1945 (not including his 1946 work, which extended his marks further).

Old Record		Ott's Record	
Runs	Wagner	1,740	Ott 1,857
Total Bases	Wagner	4,878	Ott 5,032
Extra Bases on	_		
Long Hits	Hornsby	1,777	Ott 2,161
Extra Base Hits	Hornsby	1,007	Ott 1,069
Home Runs	Hornsby	301	Ott 510
Bases on Balls	Max Carey	1,040	Ott 1,700
Runs Batted In	Hornsby '	1,597	Ott 1,856

The most sensational pitching feat of the decade was the performance of John Samuel Vander Meer, of the Cincinnati Reds, who in 1938 pitched two successive no-hit games. The first one was against the Boston Braves at Cincinnati on June 11, 1938, and the second one came on June 15, 1938, in a night game at Brooklyn, the first night game ever played at Ebbets Field.

This record was utterly without precedent. Two pitchers, Lawrence J. Corcoran of the Chicago Nationals, and Cy Young, with various clubs, had pitched three no-hit games each. Five others—James Galvin, A. W. Atkisson, Frank E. Smith, Adrian C. Joss, and Hubert B. Leonard had pitched two each. But no hurler had ever pitched two no-hitters in a single season, much less in successive starts. Four pitchers—Howard Ehmke (Boston Red Sox, 1923), Arthur C. "Dazzy" Vance (Brooklyn, 1925), James Galvin (Buffalo, 1884), and Edward Cushman (Milwaukee, Union association, 1884) held the record of allowing the least hits in successive games—one. Then along came Vander Meer.

Vander Meer was a lefthander who stood 6 ft. 1 in. in height and weighed 190 lb. He was enjoying his first full season in the major leagues at the time of his record-breaking performance.

In the first game he faced only 28 batters. Three reached first base, all on walks. The winning score was 3 to 0. In the second game he was wilder and walked eight, but won, 6 to 0. In the ninth inning of the second game he filled the bases with passes but disposed of the last two batters, one on an easy roller to third, and the last man on a short fly to centerfield.

Three years after Vander Meer's performance, the base-ball world was excited by the mighty hitting streak of Joe DiMaggio, peerless outfielder of the New York Yankees. When it continued day after day, sports writers started to thumb through their record books to determine what had been done in the past in the way of consecutive hitting. They found that the following marks had been made:

George Sisler, of the St. Louis Browns, had set the previous major league record by hitting safely in 41 consecutive games from July 27 to September 17, 1922.

William H. Keeler had set the former all-time record of hitting safely in 44 consecutive games from April 22 to June 18, 1897.

DiMaggio started his string on May 15, 1941, by getting one hit against the Chicago White Sox. He was not stopped until he had hit safely in 56 successive games. The streak ended in a night game July 17 at Cleveland Municipal stadium. The pitchers who stopped him were Al Smith, a southpaw, and Jim Bagby, a righthander, with a crowd of 67,468 looking on.

During his record run DiMaggio went to bat 223 times, scored 56 runs, and made 91 hits for an average of .408, hitting 16 doubles, four triples and 15 home runs. Oddly enough, as a player in the Pacific Coast league in 1933, DiMaggio had hit safely in 61 straight games for San Francisco.

Other interesting records were made during the decade by catchers. When Al Lopez, Pittsburgh receiver, finished the 1945 season, he had caught a total of 1,805 games, more than any backstop in history. Lopez continued the string as an active player in 1946. The best previous accomplishment was Charles "Gabby" Hartnett's run of 1,793 games, compiled over two decades of play. The American league record had been 1,721 games by Raymond W. Schalk, who spent 17 years with the Chicago White Sox.

Since Lopez' career coincided with Hartnett's in the years when the latter was usually catching more games than his rival, few people realized that Al was in the process of setting a record. But Hartnett's retirement was the signal for the unobtrusive Lopez to keep plugging away, and he achieved the record as a result.

Lopez reached the majors in 1928 with the Brooklyn Dodgers, spent 1929 with Atlanta, then returned to the majors in 1930. He put in six full seasons with Brooklyn, was traded to Boston prior to the 1936 season, then moved on to Pittsburgh in mid-season, 1940.

Two other catchers set durability records during the decade-Frank W. Hayes, of the American league, and Ray C. Mueller, of the National. Previously the most games ever caught in a single season by a catcher had been 151, by Raymond W. Schalk of the White Sox, in 1920. The National league record of 150 had been set by George Gibson, of Pittsburgh, in 1909. Gibson also held the record for most consecutive games caught in a season, 133. In 1943, Hayes caught the last two games of the season for the Philadelphia Athletics, and Mueller the last 62 for the Cincinnati Reds. In 1944, each was the regular catcher on his club and as the season progressed neither had missed a contest. Gibson's mark was surpassed by both of them late that season. Hayes caught every game played by the Athletics-155; Mueller caught every game played by the reds-155. This completely disposed of Gibson and Schalk, and the question was whether Mueller or Hayes would first miss.

That winter Mueller entered the Army, leaving an unbroken string of 217 games. Hayes continued to catch for

Philadelphia, and although he was traded to Cleveland during the 1945 season, he continued to go behind the bat regularly for that club, and finished the year with a record of 151 games, giving him a consecutive total of 308. Mueller reported to the Reds again in 1946, caught the first 16 games and was then benched, ending his streak at 233.

Another feat which won the accolade of fans was the performance of Theodore Samuel Williams, the "Splendid Splinter" of the Boston Red Sox, who compiled a batting mark of .406 in 1941, the same year in which Joe DiMaggio set his record for consecutive hitting. This was not a record, but it marked the first time that the majors had seen a .400 hitter since William H. Terry, of the New York Giants, slugged .401 in 1930 and the first time that an American league player had done it since Harry Heilmann, of Detroit, batted .403 in 1923.

The rare occasions in which .400 averages previously had been registered were as follows:

Cobb, Detroit Hornsby, St.L. Burkett, CleSt.L. Delehanty, Pha. Sisler, St.L.	1911, 1922, 1895, 1894,	.420; .401; .423; .400; .407;	1912, 1924, 1896, 1899,		1922, 1925, 1899,	.401 .403 .402
Barnes, Chi.	•	- •	-	_	1876,	.403
Anson, Chi.					1879,	.407
Dunlap, St.L.					1884,	.420
Esterbrook, N.Y.					1884,	.408
Stovey, Pha.					1884,	.404
Stenzel, Pgh.					1893,	.409
Duffy, Bos.					1894,	.438
Turner, Pha.					1894,	.423
Thompson, Det.					1894,	.403
Clarke, Louisville					1897,	.406
Lajoie, Pha. (A.L.)					1901,	.405
Jackson, Cleve.					1911,	.408
Heilmann, Det.					1923,	.403
Terry, N.Y. (N.L.)					1930,	.401

In addition to these men, a total of 14 different players hit .400 or more in 1887, when a base on balls counted as a base hit. It would obviously be unfair to include their names along with the others. For if a base on balls had counted as a base hit in 1923, "Babe" Ruth, who drew 170 passes that year, would have hit for an average of .542.

Despite the record of Ted Williams, the champion hitters of the decade were not quite up to par. A record was approached in reverse in 1945 when George "Snuffy" Stirnweiss, of the New York Yankees, paced the circuit's hitters with a mark of .309. Only Elmer Flick's 1905 mark of .306 had been lower and still the league's best. The National league never produced a leading batsman with a lower mark than .320, the figure achieved by Larry Doyle, of the Giants in 1915.

DiMaggio and Williams were the only hitters to repeat as batting champions during the decade in the American league; Ernie Lombardi, the mammoth catcher, and Stanley Musial, of St. Louis, were the only repeaters in the National. The leading batsmen of the decade follow:

National League	
1937 Joseph M. Medwick, St.L.	.374
1938 Ernest N. Lombardi, Cin.	.342
1939 John R. Mize, St.L.	-349
1940 Debs C. Garms, Pgh.	-355
1941 Harold P. Reiser, Brk.	-343
1942 Ernest N. Lombardi, Bos.	.330
1943 Stanley F. Musial, St. L.	.357
1944 Fred Walker, Brk.	.357
1945 Philip Cavarretta, Chi.	355
1946 Stanley F. Musial, St.L.	.365*

In order to qualify as batting champion of the American league, it remained necessary for a player to go to bat 400 or more times. The National league did not have such a regulation, but merely required that a player be in 100 games. In 1940, Debs Garms was declared the champion on this basis. Garms participated in only 103 games, many of them as a pinch-hitter, and went to bat but 358 times. Had the American league rule been in effect, the batting champion of the National league in 1940 would have been Stanley Hack, of the Chicago Cubs, who hit .317.

Perhaps the most controversial record of all was set by Robert Feller, Cleveland's famed fire-ball pitcher, in 1946. Feller had one of his great seasons and his strikeout ball was working with precision. Working out of turn, Feller finished the year with a record of 348 strikeouts, which may or may not have been a record, although the American league accepted it as such.

George "Rube" Waddell, eccentric pitcher of the Philadelphia Athletics, worked in 46 games in 1904, and all authorities agreed on 38 of the games. There were eight contests in which the strikeouts varied, according to which box scores were consulted.

But, however many men "Rube" Waddell struck out, the glory of Bob Feller was undimmed, and he proved to be the strikeout pitcher of his generation.

Feller's record was more impressive than Waddell's if for no other reason than the fact that he pitched 11 less innings than did Waddell. Even so, Feller's total of 372½ innings pitched in a season was extremely impressive. Waddell worked with a less lively ball, in a day when pitchers didn't need the rest that later conditions required.

During the decade there were other records set, most of them minor. Edward Miller, Boston Braves shortstop, established a fielding percentage mark for men at that position in 1942, by fielding .983, surpassing by four percentage points the record established by James E. Cooney in 1927. Miller, incidentally, led the circuit in fielding percentage five times, which tied the record set by Hugh Jennings just prior to the turn of the century.

The St. Louis Cardinals rolled up a team fielding record of .982 in 1944, and in so doing made only 112 errors, the fewest ever chalked up against a major league club.

In 1945 the Cubs won their 16th National league flag, a record, and also set a record when they won both ends of 20 doubleheaders played that season. That same year the Philadelphia Phils had the dubious record of finishing eighth for the 17th time.

Growth of Night Ball.—When Cincinnati, under its general manager, Larry MacPhail, introduced night baseball to the major leagues in 1935, the experiment was viewed with mixed feelings. It was felt that night baseball might be tolerated in Cincinnati, where it might enable the club to make a better attendance record. It was felt that the circus atmosphere of night baseball might lure fans back to the ball parks in Cincinnati, but it was considered unlikely that night ball would flourish in the larger cities of the majors. Wise minor league heads,

mindful of what night ball had already done for the minors, knew differently.

Then, in 1938, lights were installed at Ebbets Field, Brooklyn. A year later, installations at Shibe Park enabled the two Philadelphia clubs to play after dark, and the Cleveland and Chicago American league clubs followed suit. In 1940, Sportsman's Park, St. Louis, was lighted for the Cardinals and Browns; and in 1941 Washington joined the parade. With the erection of lighting plants at Yankee Stadium, New York, and Braves Field, Boston, in 1946 only three major league clubs were without lights—the Detroit Tigers, Boston Red Sox and Chicago Cubs.

At first each club was limited to seven home games, and the New York Giants even declined to play any. But when President Roosevelt expressed the desire for more night baseball during the war, the quota was increased to permit 14 contests in each city, and 21 in Washington, where most government employees were at work during the day.

Later in the war the privilege was further extended, with the result that in such cities as St. Louis and Washington a game played under the natural rays of the sun came to be unusually rare.

The growth of night baseball was extremely rapid, for it dated in the minor leagues only back to 1930. But in spite of opposition to it, it proved to be such a magnet at the gate that it was almost universally adopted.

Night baseball and the war had a curious effect on major league schedules. Games were begun at all hours of the day and night. Big league teams played morning games for the benefit of night shift war workers, started twilight-night doubleheaders at dusk, and played doubleheaders the day after contesting a night game. Toward the end of the war period, the situation changed. Twilightnight twin bills were banned, and most clubs abolished the morning contests.

Player Relations.—The decade was also featured by an attempt on the part of the players to obtain concessions from the owners in regard to playing conditions through the method of collective bargaining, and it resulted in wholesale concessions being granted.

Because of the nature of the game of baseball, the general public had never considered the ballplayer the victim of exploitation to the same degree that an industrial worker was, nor was baseball looked upon as a possible fertile field for the union movement. Players were known as strict individualists, with their salaries varying according to their ability, or according to their persuasive powers in contract negotiations. All previous attempts at unionization had been notable failures.

As early as 1884 the Union association had been formed in competition with the then existing major leagues—the National and the American Associations—as an attempt by the players to manage their own affairs. The league ended after one costly season. Six years later, the Players' league or brotherhood had been formed for the same purpose, and with the same result.

Chief bone of contention in those days had been the cornerstone of baseball law—the reserve clause, a contractual arrangement which bound a player to his club. But loathsome as such an arrangement would be in ordinary pursuits, it was considered absolutely necessary in baseball. Were a player free to go to the highest bidder each winter, the wealthier teams would soon obviously corner the best players, the poorer clubs would be unable to compete with them, and the whole structure of the game would be threatened.

Not since the Federal league war of 1914-15, when

players jumped their contracts in wholesale fashion, had baseball devoted much thought to the reserve clause or to player grievances. After that episode a general amnesty had been declared, and players who jumped had been welcomed back with open arms.

But in the latter days of World War II, two events occurred which led to a review of labour conditions among players. First, there was the Mexican league episode.

Baseball, which was originally a pastime for the people of the United States, had attracted a huge following in Latin America. Teams in Cuba and Mexico contested their games with the same fervour demonstrated by major league clubs. But the game in those countries had never been organized. Then, in 1945, Jorge Pasquel and his four brothers, organized a Mexican league and began bidding for high grade players from the United States.

The Mexican league movement reached its peak early in the 1946 season. Among the best known U.S. players who jumped their clubs and joined the Mexican league were catcher Arnold Owen, of the Brooklyn Dodgers; shortstop Vern Stephens, of the St. Louis Browns; infielder George Hausmann, and pitchers Ace Adams and Harry Feldman, of the New York Giants; pitcher Max Lanier, infielder Lou Klein, and pitcher Fred Martin, of the St. Louis Cardinals. For a few weeks hardly a day passed without some prominent player jumping or threatening to jump. Other players secured more money by revealing Mexican league offers. Major league club owners were definitely alarmed.

Stephens jumped back again, and was permitted to re-join his old club, the St. Louis Browns. Owen also came back, but an edict by Commissioner Chandler barred him for five years. Players and fans alike were almost unanimously in sympathy with the Chandler decision.

The other players remained in Mexico, but apparently the hurricane of player raids had spent its force.

The use of U.S. players in the Latin countries was a new departure. For years the clubs in the United States had been seizing Latin American players, without any regard for their contract obligations. The excuse generally offered was that baseball in other countries had not been organized. This was largely true. As early as 1884 the Providence team of the National league had a Cuban catcher, Vincent Nava. In 1910 the New Britain, Conn., club had imported four Cuban players, and two of them, Armando Marsans and Rafael D. Almeida, reached the major leagues in the following year.

The other factor in altering baseball's labour policy was the attempt by Robert Murphy, a Boston attorney, to organize major league players into a labour union. This attempt came close to succeeding. Murphy wisely settled on Pittsburgh, a strong labour town, for his first test case. The Pittsburgh Pirates, the majority of whom had signed up for the union, went so far as to call a strike, but a last minute vote changed their plans, and the team took the field.

Baseball's answer was the creation of the Executive Council, to be composed of the Commissioner, the Presidents of each of the major leagues, and two other members, one to be elected annually by a majority vote of each of the major leagues; provided, however, that in all matters concerning the standard form of a player's contract or its provisions or regulations, the players should be represented on the Executive Council by two active players, one to be elected annually by the players of each major league. Warren C. Giles, Vice President and Gen-

Paul Richards of the Detroit Tigers sliding safely home in a game against Philadelphia on July 1, 1945

eral Manager of the Cincinnati Reds, was selected as the National league representative, and L. S. MacPhail, President of the New York Yankees, was selected to represent the American league. MacPhail later resigned and was succeeded by Leslie M. O'Connor, Vice-President-Secretary-Business Manager of the Chicago White Sox. The first player representatives to be selected were John J. Murphy of the New York American league team and Fred "Dixie" Walker of the Brooklyn club.

As the decade closed, club owners were working hand in hand with the committee which represented the players. Chief concessions granted to the players included pay for players during the spring training period, the creation of a pension fund, an extension of the post-season period in which players would be permitted to barnstorm, and a liberal change in the ten-day clause. Other problems were being attacked simultaneously, and it was felt that a much better contract between player and club owner would result.

Another issue which plagued baseball but which was settled with the best possible result was the perplexing racial question. There never had been a law in organized baseball which banned the Negro player, but an unmentioned and unwritten policy provided for his exclusion Negroes had been granted tivouts by major league clubs, a few of them had appeared in major league games

for a brief period. But usually they were told that they did not have the ability

A startling answer to the racial question was given by Branch Rickey, general manager of the Brooklyn Dodgers, in the winter of 1945–46 when he announced that the Montreal club of the Brooklyn organization had signed to a contract Jackie Roosevelt Robinson, an infielder, a war veteran, and a Negro. Robinson not only played with Montreal in 1946 but led his league in hitting, and he was considered certain of playing with Brooklyn in 1947. Had Robinson failed, the cause of the Negro would probably have suffered another reverse.

Commissioner's Office.—Judge Kenesaw Mountain Landis had been selected to rule organized baseball with an iron fist, following the unfortunate world series of 1919, when a handful of Chicago players had destroyed public confidence in the game. Keeping aloof from players and club owners alike, Landis was a one-man ruling body for the game.

Landis first became acquainted with baseball law when he heard various trials resulting from the Federal league disputes, but he had long been a fan. From 1920 until his death in Chicago on Nov. 25, 1944, he was one of the most picturesque figures on the national scene. He became celebrated for his decisions, especially his 1940 edict in which he made 91 players belonging to the Detroit Tigers free agents.

During World War II, it often appeared that major

league baseball would be unable to take the field because of the various war problems: the drafting of players, transportation difficulties, and so on. Wisely knowing that the national welfare was more important than a game, Judge Landis refused to ask for special privilege. His policy was to play the game as long as possible with whatever players were available.

Baseball might have been a war casualty. In World War I the "work or fight" order put an abrupt halt to the 1918 season, and made the schedulemakers abbreviate their activity for 1919. Baseball in World War II played every game as scheduled, and the chief reason was the famous "green light" letter from President Franklin D. Roosevelt to Judge Landis, in which the President wrote:

"I honestly feel that it would be best for the country to keep baseball going. There will be fewer people unemployed and everybody will work longer hours and harder than ever before. . . .

before. . . . "Baseball provides a recreation which does not last over two hours or two hours and a half, and which can be got for very little cost. And, incidentally, I hope that night games can be extended because it gives an opportunity to the day shift to see a game occasionally.

see a game occasionally.

"As to the players themselves, I know you agree with me that individual players who are of active military or naval age should go, without question, into the services. Even if the actual quality of the teams is lowered by the greater use of older players, this will not dampen the popularity of the sport. . . .

sport. "Here is another way of looking at it—if 300 teams use 5,000 or 6,000 players, these players are a definite recreational asset to at least 20,000,000 of their fellow citizens—and that in my judgment is thoroughly worthwhile."

That was all the encouragement baseball needed, and Judge Landis' policy was followed to the letter of the law. There were inconveniences, of course. For three years, starting in 1943, major league teams trained north of the Ohio River and east of the Mississippi in order to aid the transportation situation. The amount of money raised by baseball, directly and indirectly, for the Allied cause was almost incalculable. Accounts of the games were shortwaved to U.S. troops all over the world.

There was even a touch of humour to the situation. Major league clubs in 1944 and 1945 presented unheard of players, and others who hadn't been heard of for years. No student of the game would have pretended that baseball of these years was up to par. But the fans took it in good humour. The game was the thing! It was demonstrated that mediocre teams could contest games as closely as finer ones. The 1945 world series between Detroit and Chicago went the full limit of seven games. When asked whom he thought would win it, one Chicago sports writer said, "I don't believe either club is capable of winning."

The death of Judge Landis posed quite a problem for the magnates in the selection of a successor, for the Judge had been a ruler without an heir.

Club officials were in no particular hurry to name a successor. They realized that the appointment was an important one, and that a decision, once made, could hardly be revoked. It wasn't like buying a ballplayer. They finally met in Cleveland, Ohio, on April 24, 1945, and after considering the merits of many candidates, selected U.S. Senator Albert Benjamin Chandler, of the state of Kentucky. Chandler had long been a well-known figure in major league dugouts, where his enthusiasm for the game had taken him. He had played baseball at Transylvania College and had even had a whirl at the professional game.

Not for six months after becoming Commissioner did Chandler resign his Senate post. Then, with World War II over, he did resign, to devote his full talents and energies to the game he had always loved.

One of Commissioner Chandler's first acts was to name Walter W. Mulbry, his college classmate and senate secretary, to the place held by Leslie M. O'Connor for 24 years under Judge Landis, as Secretary-Treasurer of Baseball. Later, he selected H. D. Ruel, Coach of the Chicago White Sox, to serve as Special Assistant to the Commissioner. Ruel left the Commissioner's office late in 1946 to become manager of the St. Louis Browns.

The Commissioner's office was moved from Chicago to Cincinnati.

Attendance.—Perhaps the most remarkable feature of the decade in baseball was the unparalleled attendance records.

In 1943, the two major leagues drew a total of 7,676,281 cash customers and increased it in 1944 to 8,974,738. Then, in 1945, a record total of 10,952,839 was reached. This represented an increase of approximately 22 per cent above 1944, and it seemed certain that the peak had been reached.

But in 1946 baseball fans in major league cities responded so overwhelmingly that the parks almost burst at the seams. In Brooklyn, where baseball almost constituted a psychosis, hardly a day passed without thousands of fans being turned away from Ebbets Field.

War-weary millions with plenty of money and an intense desire for recreation turned to the ball parks as they never had before. And the erection of lights at Yankee Stadium helped swell the total. Unofficial but highly reliable estimates of 1946 attendance placed the figure at 18,612,704, almost doubling the 1945 figure, which had been considered fantastic at the time.

The home attendance figures for each major league club from 1944 to 1946 were as follows:

	NATIONAL	LEAGUE	
	1944	1945	1946
Brooklyn	618,198	1,064,668	1,796,155
Chicago	640,110	1,037,026	1,342,970
New York	733,598	1,038,195	1,234,733
Philadelphia	367,417	310,389	1,045,245
St. Louis	486,851	594,207	1,063,203
Boston	245,197	410,146	987,109
Pittsburgh	653,912	623,398	759,117
Cıncınnati	431,297	294,790	717,751
TOTAL	4,176,580	5,372,819	8,946,283
	AMERICAN	LEAGUE	
	1944	1945	1946
New York	789,995	881,445	2,309,029
Detroit	923,176	1,280,341	1,722,590
Boston	506,975	603,794	1,416,944
Cleveland	475,272	558,182	1,052,289
Washington	525,235	652,660	1,027,221
Chicago	563,539	657,981	988,655
Philadelphia	505,322	462,631	623,145
St. Louis	508,644	482,986	526,548
TOTAL	4,798,158	5,580,020	9,666,421
GRAND TOTAL	8,974,738	10,952,839	18,612,704

Prior to 1946, the most people who had ever attended games in one city in one season were the 1,485,166 who poured into Wrigley Field, Chicago, in 1929. In 1946, the New York Yankees were almost a million in excess of that figure. The Brooklyn Dodgers and Detroit Tigers were also ahead of it.

Six clubs in each league set new park records for attendance. A case in point was that of the Philadelphia Phillies. Thirty years before, in 1916, the Phillies had drawn a few over five hundred thousand for their park

record. That record stood for three decades and was then virtually doubled.

Minor League Baseball.—Not only the majors, but the entire structure of minor league baseball was strengthened by the gigantic attendance of 1946. This was all the more gratifying because minor league baseball had almost gone out of existence during the war. It sank in 1945 to the lowest point it had ever reached. In the scraping of the manpower barrel, the majors could get by with old-timers and under-age boys. But there weren't enough to go around. The leagues of low classification, depending entirely on men well within the draft age, simply gave up and surrendered their franchises.

In its entirety, minor league baseball in 1945 was as follows:

Class AA: American association, International league, Pacific Coast league.

Class A-1: Southern association.

Class A: Eastern league.

Class B: Inter-State league, Piedmont league.

Class C: Carolina league.

Class D: Appalachian league, North Carolina State league, Ohio State league, Pony league.

There were only nine circuits lower than AA classification to feed players to the majors. Even in the midst of the depression, in hopeless 1933, eleven leagues of this type kept their heads above water.

It was expected that minor league baseball would blos-

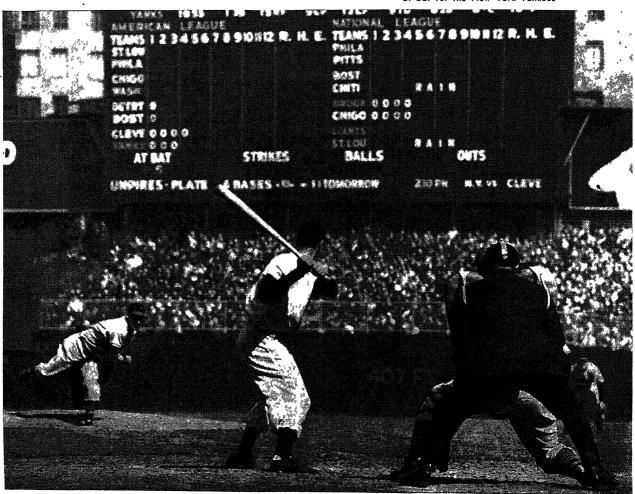

som again, but not to the proportions realized in only one brief year. At the December minor league meeting in Columbus, Ohio, in 1945, Class AAA was created and other league classification changes were effected. By way of contrast, the minor league picture in 1946 was as follows:

Class AAA: American association (Columbus, O., Indianapolis, Ind., Kansas City, Mo., Louisville, Ky., Milwaukee, Wis., Minneapolis, Minn., St. Paul, Minn., and Toledo, O.); International League (Baltimore, Md., Buffalo, N.Y., Jersey City, N.J., Montreal, Que., Newark, N.J., Rochester, N.Y., Syracuse, N.Y., Toronto, Ont.); Pacific Coast League (Hollywood, Calif., Los Angeles, Calif., Oakland, Calif., Portland, Ore., Sacramento, Calif., San Diego, Calif., San Francisco, Calif., Seattle, Wash.).

Class AA: Southern association (Atlanta, Ga., Birmingham, Ala., Chattanooga, Tenn., Little Rock, Ark., Memphis, Tenn., Mobile, Ala., Nashville, Tenn., New Orleans, La.); Texas League (Beaumont, Texas; Dallas, Texas; Fort Worth, Texas; Houston, Texas; Oklahoma City, Okla.; San Antonio, Texas; Shreveport, La.; Tulsa, Okla.).

Class A: Eastern league (Albany, N.Y., Binghamton, N.Y., Elmira, N.Y., Hartford, Conn., Scranton, Pa., Utica, N.Y., Wilkes-Barre, Pa., Williamsport, Pa.); South Atlantic league (Augusta, Ga., Charleston, S.C., Columbia, S.C., Columbus, Ga., Greenville, S.C., Jacksonville, Fla., Macon, Ga., Savannah, Ga.).

Bob Feller delivering a ball during the no-hit game he pitched for the Cleveland Indians on April 30, 1946. Joe DiMaggio is shown at bat for the New York Yankees

Class B: Inter-State league (Allentown, Pa., Hagerstown, Md., Harrisburg, Pa., Lancaster, Pa., Sunbury, Pa., Trenton, N.J., Wilmington, Del., York, Pa.); Mexican National league (Chihuahua, Mexico; El Paso, Texas; Juarez, Mexico; Mexico City, Mexico; Saltillo, Mexico; Torreon, Mexico); New England League (Fall River, Mass., Lawrence, Mass., Lynn, Mass., Manchester, N.H., Nashua, N.H., Pawtucket, R.I., Portland, Maine, Providence, R.I.); Piedmont league (Lynchburg, Va., Newport News, Va., Norfolk, Va., Portsmouth, Va., Richmond, Va., Roanoke, Va.); Southeastern league (Anniston, Ala., Gadsden, Ala., Jackson, Miss., Meridian, Miss., Montgomery, Ala., Pensacola, Fla., Selma, Ala., Vicksburg, Miss.); Three I league (Danville, Ill., Davenport, Ia., Decatur, Ill., Evansville, Ind., Quincy, Ill., Springfield, Ill., Terre Haute, Ind., Waterloo, Ia.); Tri-State league (Anderson, S.C., Asheville, N.C., Charlotte, N.C., Knoxville, Tenn., Shelby, N.C., Spartanburg, S.C.); Western International league (Bremerton, Wash., Salem, Ore., Spokane, Wash., Tacoma, Wash., Vancouver, Canada, Victoria, Canada, Wenatchee, Wash., Yakima, Wash.).

Class C: Border league (Auburn, N.Y., Granby, Que., Kingston, Ont., Ogdensburg, N.Y., Sherbrooke, Que., Watertown, N.Y.); California league (Bakersfield, Fresno, Modesto, Santa Barbara, Stockton, Visalia); Canadian-American league (Amsterdam, N.Y., Gloversville-Johnstown, N.Y., Oneonta, N.Y., Pittsfield, Mass., Quebec, Que., Rome, N.Y., Schenectady, N.Y., Three Rivers, Que.); Carolina league (Burlington, N.C., Danville, Va., Durham, N.C., Greensboro, N.C., Leaksville-Spray-Draper, N.C., Martinsville, Va., Raleigh, N.C., Winston-Salem, N.C.); East Texas league (Greenville, Henderson, Jacksonville, Luskin, Paris, Sherman, Texarkana, Tyler); Florida International league (Havana, Cuba, Lakeland, Fla., Miami, Fla., Miami Beach, Fla., Tampa, Fla., West Palm Beach, Fla.); Middle Atlantic league (Butler, Pa., Erie, Pa., Johnstown, Pa., Niagara Falls, N.Y., Oil City, Pa., Youngstown, O.); Northern league (Aberdeen, S.D., Duluth, Minn., Eau Claire, Wis., Fargo, N.D., Grand Forks, N.D., St. Cloud, Minn., Sioux Falls, S.D., Superior, Wis.); Pioneer league (Boise, Idaho; Idaho; Idaho; Ogden, Utah; Pocatello, Idaho; Salt Lake City, Utah; Twin Falls. Idaho); Western association (Fort Smith, Ark.; Hutchinson, Kas., Joplin, Mo., Leavenworth, Kas., Muskogee, Okla., St. Joseph, Mo., Salina, Kas., Topeka, Kas.); West Texas-New Mexico league (Abilene, Texas; Albuquerque, N.Mex.; Amarillo, Texas; Borger, Texas; Clovis, N.Mex.; Lamesa, Texas; Lubbock, Texas; Pampa, Texas).

Class D: Alabama State league (Brewton, Ala., Dothan, Ala., Geneva, Ala., Greenville, Ala., Ozark, Ala., Troy, Ala.); Appalachian league (Bluefield, W.Va., Bristol, Va., Elizabethton, Tenn., Johnson City, Tenn., Kingsport, Tenn., Narrows, Va., Pulaski, Va., Welch, W.Va); Blue Ridge league (Galax, Va., Mount Airy, N.C., Radford, Va., Salem, Va.); Coastal Plain league (Fayetteville, N.C., Goldsboro, N.C., Greenville, N.C., Kinston, N.C., New Bern, N.C., Rocky Mount, N.C., Tarboro, N.C., Wilson, N.C.); Eastern Shore league (Cambridge, Md., Centreville, Md., Dover, Del., Easton, Md., Federalsburg, Md., Milford, Del., Salisbury, Md., Seaford, Del.); Evangeline league (Abbeville, La., Alexandria, La., Baton Rouge, La., Hammond, La., Houma, La., Natchez, Miss., New Iberia, La., Thibodeaux, La.); Florida State league (Daytona Beach, Deland, Gainesville, Leesburg, Orlando, Palatka, St. Augustine, Sanford); Georgia-Alabama league (Carrollton, Ga., La Grange, Ga., Lanett, Ala., Newman, Ga., Opelika, Ala., Tallassee, Ala.); Georgia-Florida league (Albany, Ga., Americus, Ga., Cordele, Ga., Moultrie, Ga.,

Players of the Mexican Baseball league, on the bench during a 1946 game at Mexico City. The league included several noted U.S. imports including George Hausmann, formerly of the N.Y. Giants and Mickey Owen, catcher for the Brooklyn Dodgers

Tallahassee, Fla., Thomasville, Ga., Valdosta, Ga., Waycross, Ga.); Kansas-Oklahoma-Missouri league (Bartlesville, Okla., Carthage, Mo., Chanute, Kas., Iola, Kas., Miami, Okla., Pittsburg, Kas.); Kıtty league (Cairo, Ill., Clarksville, Tenn., Fulton, Ky., Hopkinsville, Ky., Madisonville, Ky., Mayfield, Ky., Owensboro, Ky., Union City, Tenn.); North Atlantic league (Bloomingdale, N.J., Carbondale, Pa., Mahanoy City, Pa., Nazareth, Pa., Newburgh, N.Y., Nyack, N.Y., Peekskill, N.Y., Stroudsburg, Pa.); North Carolina State league (Concord, N.C., Hickory, N.C., Landis, N.C., Lexington, N.C., Mooresville, N.C., Salisbury, N.C., Statesville, N.C., Thomasville, N.C.); Ohio State league, Dayton, O., Lima, O., Marion, O., Middletown, O., Newark, O., Richmond, Ind., Springfield, O., Zanesville, O.); Pennsylvania-Ontario-New York league (Pony league) (Batavia, N.Y., Bradford, Pa., Hamilton, Ont., Hornell, N.Y., Jamestown, N.Y., Lockport, N.Y., Olean, N.Y., Wellsville, N.Y.); Tobacco State league (Angier-Fuquay Springs, N.C., Clinton, N.C., Dunn-Erwin, N.C., Sanford, N.C., Smithfield, N.C., Wilmington, N.C.); Wisconsin State league (Appleton, Fond du Lac, Green Bay, Janesville, Oshkosh, Sheboygan, Wausau, Wisconsin Rapids).

It will be observed that a total of 43 minor leagues operated in 1946, almost five times as many as in the previous season. These 43 minor leagues drew more than 30,000,000 admissions during the year, a new record.

Each year the winners of the playoff in the American association met the playoff winners of the International league in the Junior World Series, a best four out of seven engagement patterned after the world series. The results of these series played from 1937 through 1946 were as follows:

YEAR	WINNER	MANAGER	GAMES	LOSER	MANAGER
1937 1938 1939 1940 1941 1942 1943 1944 1945	Newark Kansas City Louisville Newark Columbus Columbus Columbus Baltimore Louisville Montreal	MANAGER Oscar Vitt Bill Meyer Bill Burwell Johnny Neun Burt Shotton Eddie Dyer Nick Cullop Tommy Thoma Harry Leibold Clay Hopper	7 7 7 6 6 5 5 6	Columbus Newark Rochester Louisville Montreal Syracuse Syracuse Louisville Newark Louisville	Burt Shotton Johnny Neun Billy Southworth Bill Burwell Clyde Sukeforth Jewel Ens Jewel Ens Harry Leibold Bill Meyer HarryLeibold
					•

Champions of the Pacific Coast League during the decade (winners on a percentage basis during the regular season, not winners of the playoff) were as follows:

		P
	Sacramento	
1938	Los Angeles	
1939	Seattle	
1940	Seattle	
1941	Seattle	•5
1942	Sacramento	
1943	Los Angeles	
1944	Los Angeles	
1945	Portland	.6
1946	San Francisco	.6

Basketball

Elimination of the centre jump in 1937 brought basketball a period of revolution unparalleled in major sports. Not only did play become faster and scoring higher, but attendance and popularity soared; an estimated 100,000,000 fans witnessed basketball games during the 1946–47 season.

Prior to 1937, the ball had been put in play at the beginning of each period and after each goal by tossing it between the two opposing centres at mid-court, thus giving each team an equal opportunity to obtain the ball. The new 1937 rules read: "After a goal from the field, any player of the team scored upon shall put the ball in play from any point out of bounds at the end of the court where the goal was made." The team was given ten seconds to move the ball across the centre line or forfeit it to the opposing team.

The elimination of the centre jump, except at the start of each half and after the calling of technical and double fouls, speeded up the game considerably. Additional rules were changed throughout the following ten years, such as the permission of five personal fouls instead of four; but all were of minor consequence compared to the revolutionary move of 1937, which sent scores soaring steadily. Of the 6,000 college games played in 1945, the average game produced a record 90 points for both teams. In 1946, the record rose to 91.8 for 9,000 contests.

In keeping with the rise in scoring over the 1937–46 decade, Robert Kurland of Oklahoma Agricultural and Mechanical college finished the 1945–46 season with an all-time scoring record for major competition with 58 points against St. Louis university. George Mikan of DePaul university set a career-total of 1,870 points, two more than any other player in the modern history of major college basketball.

As further proof of the increased scoring tempo, the first 23 among all-time individual scorers for a single season performed after 1937. Of the 14 top scorers for a single game, all but two were made under the changed rules. Of the 14 high scorers during collegiate careers, all but one had the benefit of the 1937 changes in play.

Tournaments, Double-Headers, All Stars.—Another development in basketball during the decade was the tournament. In 1939, the National Collegiate Athletic Association inaugurated annual tournaments to select national champions, with semifinal competitions to determine representatives from the east and west, usually at New York city and Kansas City, and the championship playoff at Madison Square garden, New York. Oklahoma A. & M. was the only two-time winner of the N.C.A.A., while the west held a six to two edge through 1946. Dartmouth and Ohio State each had appeared in four of the eight tournaments and captured six of ten decisions.

The National Invitation tournament was started in 1938, drawing eight outstanding college teams to Madison Square garden. St. John's and Long Island university each won the invitation tournament twice, the former scoring in the successive seasons of 1943 and 1944. Such other tournaments as the National Intercollegiate at Kansas City, Mo., and the World Professional at Chicago also added to the interest and drawing power of tournament play after 1937.

The presentation of two college games on the same program had been an innovation at Madison Square garden in 1936, but did not realize its full potentialities until the 1940s. There were 21 bills presented at the garden in 1946, drawing an average of 18,112 fans for a total of 380,346. Double-headers were begun in 1941 at the huge Chicago stadium, and in the final game of 1946 drew 22,822 fans, largest crowd to see a college basketball contest. During 1945–46, more than 162,000 fans witnessed 12 double-headers at the Chicago stadium.

Boston, Philadelphia, Buffalo and other major cities also inaugurated double-headers during the new era of post-1937 basketball.

In 1939, outstanding college players of the previous season played the world's professional champion in what was to become an annual game. At the close of 1946, the collegians had won five of the games, and the professionals two, both successively by the Fort Wayne, Ind., Zollners in 1944 and 1945.

Professionals.—The paid-to-play phase of basketball also received great impetus from 1937 to 1946. At the close of 1946, three major leagues—the National, American and Basketball Association of America—were in operation, along with numerous minor and semipro circuits.

Newest addition to the professional circle was the Basket-ball Association of America, organized in the summer of 1946 by the Arena Owners association. Having access to the leading indoor stadia in the country, such as the Chicago stadium, Madison Square garden and Boston garden, the B.B.A.A. provided a serious threat to the established National and American leagues.

Outstanding Players and Teams.—The new type of basketball was quick to enhance the brilliance of the individual, and the ten-year period from 1937 to 1946 was replete with outstanding athletes. Angelo "Hank" Luisetti of Stanford grabbed the spotlight at the start of the era, and soon it was turned on such stars as George Glamack of North Carolina, Andy Phillips of Illinois, "Brooms" Abramovic of Salem, Mikan of DePaul, Kurland of Oklahoma A. & M., Bob Davies of Seton Hall, Gail Bishop of Washington State, Ed Riska and Leo Klier of Notre Dame,

Annual selections of the Helm foundation for "player of the year" among college athletes were as follows from 1937 to 1946: Luisetti of Stanford, 1937 and 1938; Chet Jaworski, Rhode Island State, 1939; Glamack of North Carolina, 1940 and 1941; Stan Modzelewski of Rhode Island State (who later played basketball under the name of Stan Stutz), 1942; George Senesky, St. Joseph's, 1943; Mikan of DePaul university, 1944 and 1945; Kurland, Oklahoma A. & M., 1946.

In the professional field, Bobby McDermott, a player who never attended college, stood out as player-coach of the Fort Wayne, Ind., Zollners. Under McDermott, the Zollners won the world's professional championship in 1944, 1945 and 1946.

Starting with Stanford in 1937, many outstanding teams dominated play during the decade. Wisconsin and Long Island university were standouts in 1941, while Notre Dame had formidable teams in 1938, 1941 and 1946. The "Whiz Kids" of the Illinois team in 1942 were regarded as one of history's finest fives. DePaul, with Mikan at centre, was ranked no lower than third nationally during the three-year period from 1944 to 1946. Oklahoma's feat of winning successive National Collegiate Athletic association tournaments in 1945 and 1946 had no parallel. Wyoming was an exceptional team in 1943.

The Phillips "66" squad of Bartlesville, Okla., dominated the A.A.U. national tournament in the later years of the decade with successive championships from 1943 to 1946. In the ten-year period, Phillips "66" won five A.A.U. titles and finished second on three occasions.

Although many women's teams switched to men's rules, the A.A.U. championship continued to be conducted under the women's code. Led by Alline Banks, seven times "All-American" and high tournament scorer for four years, Nashville, Tenn., was the only team to win the national title three straight years.

Year-by-Year Developments.—In 1937, first year of the decade, Stanford was rated the No. 1 team in the country, even as the Indians' Luisetti stood out among individuals. Pennsylvania topped the Eastern league, while Minnesota won its only Western Conference championship of the decade. Kansas, which shared in six of the ten Big Six championships, was tied with Nebraska for first place. Georgia Tech in the southeast, Southern Methodist in the southwest, Montana State in the Rocky Mountain conference and Stanford on the Pacific coast were other sectional leaders. In the 1937 A.A.U. tournament, the Denver Safeways of the host city won the men's championship with a 43-38 victory over Phillips "66" in the final. Little Rock, Ark., broke a three-year reign of the Tulsa, Okla., Stenos in winning the women's title, and defeated Galveston, Tex., in the final, 17 to 10.

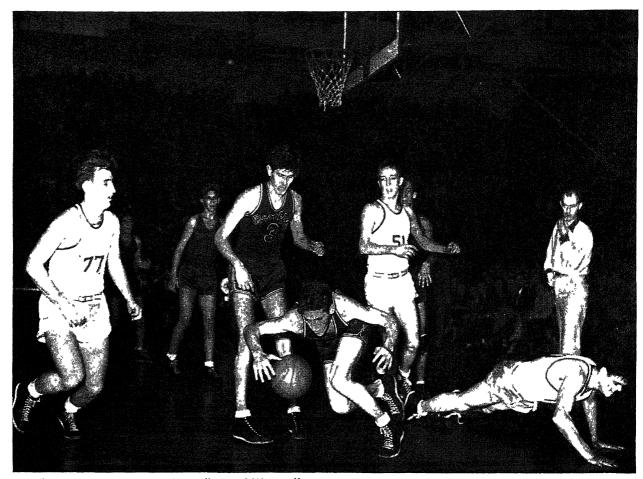

Temple rose to the pinnacle as the No. 1 team of 1938, although eastern play was highlighted by Dartmouth's launching of an eight-title reign at the top of the Eastern league. Purdue, always a power, won the Western Conference championship, and Kansas took precedence in the Big Six. Other conference champions were: Kentucky, southeast; Arkansas, southwest; Colorado, Rocky mountain, and Stanford again on the Pacific coast. Temple highlighted its successful season by winning the National Invitation tournament inaugural, defeating Arizona, 77 to 53; West Virginia, 59 to 51, and Rhode Island State, 46 to 45. The Healy Motors of Kansas City, Kan., won the men's A.A.U. title with a 40–38 victory over Denver, Colo., Safeways in the final. The Galveston, Tex., Anicos made it two in a row with a 13–8 victory over Wichita,

Kan., in the women's final. Oshkosh, Wis., won the championship of the newly-launched National Pro Basketball league.

In 1939, Long Island university won the National Invitation tournament and gained No. 1 rating by the Helm foundation as best team of that year. Long Island defeated New Mexico Aggies, 52 to 45; Bradley Tech, 36 to 32 and Loyola university, 44 to 32, in winning the invitation. The National Collegiate Athletic association inaugural was won by Oregon, 46-33, over Ohio State. Dartmouth continued to pace the Eastern league; Ohio State won the first of two Western Conference (Big Nine) championships it was to acquire in six years, and the Big Six became involved in a two-way tie between Oklahoma and Missouri. Other sectional leaders were: Alabama, southeast; Texas, southwest; Greeley State, Rocky mountain; Oregon, Pacific coast. The Denver Nuggets defeated Phillips "66," 25 to 22, in the annual A.A.U. men's championship. The Galveston, Tex., Anicos, coached by Frances Williams, the first woman to lead a team to the title, won the women's A.A.U. title with an easy 21-8 victory over Little Rock. Oshkosh repeated as National league champion, and the world pro crown went to the New York Rens. Dr. James Naismith, inventor of basketball in 1891, died during 1939.

Interest in basketball picked up noticeably during 1940, with 212,672 spectators attending 15 double-headers at Madison Square garden. No outstanding college team developed during the year. Indiana won the N.C.A.A. with a 60-42 victory over Kansas in the final; Colorado won the national invitation with victories over DePaul, 52 to 37 and Duquesne, 51 to 40, and Southern California was rated the No. 1 team by the Helm foundation. Dartmouth continued to dominate the Eastern league for its third straight title in 1940; Purdue returned as Big Nine champion, and the Big Six became entangled in a three-way tie between Kansas, Oklahoma and Missouri. Other sectional leaders were: Kentucky, southeast; Rice, southwest; Colorado, Rocky mountain; Southern California, Pacific coast. Phillips "66" moved up into the A.A.U. title ranks with a 39-36 final victory over the Denver Nuggets, while Little Rock, Ark., started a two-year reign of the women's A.A.U. tournament with a 23-13 triumph over the Nashville, Tenn., Business college sextet. The Akron, O., Firestones won the National League crown in 1940, and the Harlem Globetrotters won the world's pro tour-

Wisconsin rated No. 1 acclaim in 1941 on its Big Nine championship, its triumph in the N.C.A.A. tournament and its top recognition by the Helm foundation. The Badgers defeated Washington State in the N.C.A.A. final, 39 to 34. Long Island university, which defeated Wisconsin during the regular season, 56 to 42, won the national invitation with victories over Westminster, 48 to 36; Seton Hall, 49 to 26 and Ohio State, 56 to 42. Dartmouth went through the formality of winning its fourth Eastern crown in 1941; Kansas and Iowa State divided honours in the Big Six, and Duke in the south, Arkansas in the southwest, Montana State in the Rocky mountain, and Washington State on the Pacific coast were returned sectional winners. The 20th-Century-Fox team of Hollywood defeated the Olympic club of San Francisco in their all-California final, 47 to 34. Luisetti, former Stanford star with the Olympic club, was voted the tournament's most valuable player. Little Rock won its second straight women's championship over Nashville, 16 to 15. The

Fast play in a game between Brooklyn college and Western Kentucky in Dec. 1944. The game ended with a close score of 49–45 in favour of Brooklyn

Firestones of Akron, repeated as National league champion in 1941, while Detroit won the world's pro tournament.

In 1942 Stanford university easily soared to the National Collegiate Athletic association championship with a 53-38 victory over Dartmouth in the final, and also added the Southern division crown of the Pacific Coast conference to its accomplishments. The National Invitation tournament was won by West Virginia with a close victory, 47 to 45, over Kentucky in the final. West Virginia defeated Long Island university, 58 to 49, and Toledo, 51 to 39, to reach the title game. Dartmouth captured its fifth straight Eastern championship in 1942, while Duke continued its hold on the Southern conference and Kentucky, and Georgia shared honours in the southeast. Illinois won the Western conference title, while other sectional winners were as follows: southwest, Arkansas and Rice; Missouri valley, Creighton and Oklahoma A. & M.; Big Six, Kansas and Oklahoma; Big Seven, Colorado; Pacific coast, Stanford (southern division) and Oregon State (northern division); New England, Rhode Island. Both A.A.U. championships went west of the Mississippi in 1942, the Denver, Colo., American Legion winning the men's championship with a final victory over Phillips "66" and the women's going to the American Institute of Commerce at Davenport, Ia. On the professional front, Wilmington, Del., won the American league championship and Oshkosh, Wis., topped the National league and won the annual world professional tournament. Oshkosh was beaten by the college all-stars, 61 to 55, in the exhibition game which

launched the 1942-43 season. The year 1942 also marked the reappearance of service teams in major college basketball, with the Great Lakes Naval Training station generally judged the outstanding service team of the year.

In its last big year until the end of World War II, college basketball brought forth two outstanding teams in 1943-the universities of Illinois and Wyoming. Illinois, manned by the famous "Whiz Kids," all of whom were in the armed services by the start of the 1944 season, won the Western conference championship, but did not compete in postseason tournaments. Wyoming started its successful campaign by winning the Rocky Mountain conference and went on to capture the National Collegiate Athletic association tourney, defeating Georgetown in the final, 46 to 34. St. John's university of Brooklyn captured the first of its two successive National Invitation titles by defeating Rice, 51 to 49; Fordham, 60 to 43, and Toledo, 48 to 27, in the 1943 tournament. In a Red Cross benefit bringing together the two tournament victors, Wyoming stopped St. John's, 52 to 47. Dartmouth once again topped the Eastern league, winning its sixth straight title. Duke continued as ruler of the south in spite of serious opposition from George Washington university. Rice and Texas shared the southwest title and Tennessee and Kentucky dominated the southeast. Washington proved outstanding on the Pacific coast, while Kansas topped the Big Six and Creighton the Missouri Valley conference. Phillips "66" regained its National A.A.U. championship with a 57-40 victory over the Denver legion in the final. The American Institute of Commerce of Davenport, Ia., repeated as A.A.U. women's title holder with a 41-31 triumph over Des Moines in an all-Iowa final. Fort Wayne,

Ind., won the 1943 National league championship and the Philadelphia Sphas topped the American league. The Washington, D.C., Bears captured the world pro championship, but were beaten by the College All-Stars, 35 to 31, in the 1943 exhibition at Chicago.

Hardly recognized as a title contender at the start of the 1944 season, the University of Utah became the nation's leading college team with a series of late-season successes. Utah rose to prominence with a 40-33 victory over Iowa State in the western N.C.A.A. playoff, and went on to defeat Dartmouth in the east-west final, 42 to 40. It wound up as champion of all it surveyed by taking the measure of St. John's, 43 to 36, in the Red Cross playoff involving the N.C.A.A. and National Invitation champions. St. John's retained its invitation title with a three-way conquest of Bowling Green, 44 to 40; Kentucky, 48 to 45 and DePaul, 47 to 39. Dartmouth won its seventh straight Eastern title in 1944, and Army finished a 15game schedule without a defeat. Ohio State won the Big Nine title in a close finish with Iowa, while Duke in the south, Kentucky in the southeast and Rice and Arkansas in the southwest were other sectional winners. Iowa State and Oklahoma were tied for the Big Six title; Oklahoma A. & M. topped the Missouri Valley conference; Washington and Southern California topped the northern and southern divisions, respectively, of the Pacific Coast conference. For the third straight year, Phillips "66", and the Denver Legion reached the A.A.U. men's final in 1944, with the former retaining the title on a 50 to 43 victory. The Nashville, Tenn., Vultrees won the women's A.A.U. crown with a 23-15 victory over Des Moines, Ia. Fort Wayne dominated professional basketball by capturing the National league and world's pro title, while the Wilmington, Pa., Bombers led the American league. Fort Wayne brought the pros their first victory in five allstar games by defeating the collegians, 48 to 38, at the 1944 classic in Chicago.

In 1945, Oklahoma A. & M. college started a two-year reign of major college basketball by winning both the N.C.A.A. and Red Cross finals. The Oklahoma Aggies first won the national collegiate final with a 49-45 conquest of New York university, and annexed the Red Cross title on a 52-44 victory over DePaul. Led by Mikan, who established six tournament scoring records, DePaul waded impressively through three opponents to capture the national invitation meet. DePaul toppled West Virginia, 76 to 52; Rhode Island State, 97 to 53 and Bowling Green, 71 to 54. Among Mikan's six scoring marks was that of 53 points for the Rhode Island State game. Pennsylvania interrupted a string of seven straight championships for Dartmouth and won the Eastern league title, but Army was judged the leading team on the Atlantic coast. St. John's led the Metropolitan league. The University of Iowa captured its first Big Nine championship with 11 victories and one defeat. The University of North Carolina replaced Duke as champion of the Southern conference, while Kentucky repeated in the southeast and Rice Institute dominated the southwest. Iowa State won the Big Six championship; Oklahoma A. & M. added

the Missouri valley crown to its national rating; the University of Utah topped the Big Seven, and the University of Oregon and University of S. California at Los Angeles won the north and south divisions, respectively, of the Pacific Coast conference. "Phillips "66" won its third straight A.A.U. title in 1945, defeating the Denver Ambrose, 47–46, in the final. The Nashville Vultrees retained their women's A.A.U. championship with a 22–20 victory over Little Rock, Ark., in the final. The Fort Wayne Zollners again dominated the professional game by winning the National league championship and defeating the college all-stars in their annual exhibition. The Philadelphia Sphas won the American league title.

Basketball was marred by its biggest scandal in 1945. Five members of the Brooklyn college basketball team were expelled from school for accepting bribes to "throw" a game. Two gamblers were sentenced to one year in jail and fined \$500 as authors of the bribes.

In 1946, Oklahoma A. & M. once again rose to the top of the collegiate basketball picture during a return of the game to its prewar popularity. Record crowds, including 628,718 for the double-header and tournament schedule at Madison Square garden, were attracted by postwar basketball, which was climaxed by Oklahoma A. & M.'s 43-40 conquest of North Carolina in the N.C.A.A. final. Led by seven-foot Kurland, the Oklahoma Aggies won 31 and lost two games. The University of Kentucky won the National Invitation championship in 1946, defeating Arizona, 77 to 53; West Virginia, 59 to 51, and Rhode Island State, 46 to 45, in that order. Dartmouth regained its Eastern championship for a record of eight titles in nine years. New York university and St. John's divided Metropolitan league honours, while Kentucky led in the southeast, Duke in the south, and Baylor in the southwest. Ohio State won the Western conference championship; Kansas led the Big Six; Oklahoma A. & M. led the Missouri valley, and Wyoming topped the Big Seven. The University of Idaho won its first title since 1923 in taking the Pacific Coast championship, defeating the University of California in the playoff. championship, drawing a record 64 teams, went to Phillips "66" for the fourth straight time. The Bartlesville, Okla., team defeated the San Diego Dons, 45 to 34, in the final. The Nashville, Tenn., Goldblumes won the women's crown with a 26-20 victory over Des Moines, Ia.

The Fort Wayne Zollners repeated as world professional champions in 1946, but lost the annual classic to the college all-stars, 57 to 54. Rochester, N.Y., won the National

Batista y Zaldivar, Fulgencio

Batista (1901—), Cuban army officer and statesman, worked at odd jobs in his youth, joined the Cuban army in 1921 and the rural guard in 1923. Later he became a clerk at staff headquarters. One of the leading figures in the revolt that overthrew the Gen. Gerardo Machado dictatorship in 1933, Batista was appointed chief of the army staff after Machado's downfall. In turn Batista exercised dictatorial rule over all Cuba and governed for seven years without a mandate from the people. Finally in Dec. 1939 he announced he would be a candidate in the presidential elections for 1940.

Nominated by a Socialist Democratic coalition, Batista defeated his opponent, Ramón Grau San Martín, in the elections of July 1940, and he was installed in office the following October. After Cuba declared war on the axis in Dec. 1941 Batista took energetic measures against axis sabotage and espionage and arrested all aliens suspected of dealings with the enemy powers. In 1944 a threatened revival of student revolutionary organizations, similar to those which had inspired the revolution that swept Machado out of office, led Batista to order new elections. On June 2, 1944, Grau San Martín was elected in what foreign observers called the first "clean" elections in Cuba in 30 years. Credit was given Batista for the electoral organization and the astonishing lack of fraud. Although Grau San Martín had won the presidency, Batista's supporters had won a majority of seats in both houses of congress. Batista retired in Oct. 1944 and subsequently toured the Americas.

Batt, William Loren

Batt (1887?—), U.S. government official and industrialist, was born in Salem, Ind., and was graduated from Purdue university in 1907 with a degree in engineering. He assisted in the research and installation of ball bearings in locomotives, and later became president of the S.K.F.

Industries, a Swedish-owned ball-bearings firm.

A deputy commissioner of the National Defense Advisory committee's raw materials division in 1940, he became deputy director of the production division of the Office of Production Management in Jan. 1941, later becoming director. He was also a member in 1941 of President Roosevelt's special mission to Moscow, with rank of minister. Donald Nelson, director of the War Production board, named Batt head of the WPB's requirements committee as well as director of the raw materials division in Jan. 1942. Batt resigned from the WPB in May 1942 to devote more time to his other posts.

In Aug. 1943, following creation of the U.S.-Canada Joint War Aid committee by President Roosevelt and Prime Minister Mackenzie King, Batt was appointed as one of the heads of the U.S. delegation. On Sept. 8, 1945, he was named to head yet another government office, that of the newly-created interagency policy committee on rubber, whose purpose was to formulate a co-ordinated national policy and avert a possible serious rubber shortage.

Bauxite

World production data on bauxite, as shown in Table I, were revised for nearly all of the important producing countries, giving the most reliable figures available after censorship cut off so much of the information during World War II.

War demand necessitated increased supplies of bauxite, not only for aluminum, but for other uses, especially abrasives and chemicals. The largest increases occurred in British Guiana, Hungary, Surinam and the United States. All told, output increased nearly fourfold. Of the peak output of 1943, the United States produced 45%, as compared with 12% in 1937 and 9% in 1939.

During World War I, U.S. production of bauxite rose to a peak of nearly 680,000 short tons, three times the prewar level of operation. After that war the opinion was freely expressed that so much of the cream had been skimmed off the domestic reserves to satisfy the war demand that production would never again be able to equal the war rate. This prediction held trué through the beginning of World War II and up to 1941. During the interwar period, the U.S. domestic output had ranged from 300,000 to 500,000 tons, with increasing amounts of imports to meet the rising demand; imports first exceeded output in 1925 and from then up to 1940, imports supplied a total tonnage that considerably exceeded the domestic production.

The progress of the bauxite industry in the United States during 1937-45 is outlined in Table II.

War production of bauxite in the United States did not get under way until in 1941, but then it made up for lost time, with a total output of 17,760,000 tons of crude baux-

ite in the years 1941–45—an amount greater by half than all the preceding output which had been recorded from 1889 through 1940.

In these five years the United States accounted for 40% of the world's total bauxite output, as compared with 10% in the five years preceding.

Imports also rose to levels never before attained, but in 1941-45 imports averaged only 36% of the domestic output, instead of 25% greater, as had been the case during the preceding five years.

Of the total production of bauxite in the United States in 1941-45, the production of metal took 46%, and emergency stocks absorbed 38%; eliminating stocks, and considering only that actually consumed, the division was 75% for metal, 13% for abrasives, 9% for chemicals and 3% for other uses.

(G. A. Ro.)

Beans, Dry

World bean production increased steadily from 1936 to 1946, reaching a total of nearly 90,000,000 one-hundred-lb. bags in 1945. The greatest increases were in the United States and Brazil, which together produced nearly half the world's crop. Other important dry bean producing countries were Egypt, Italy, Rumania, Spain, Mexico and

Youthful volunteers of Salisbury, Md., helping to harvest the bean crop in 1943

France. Only small quantities were exported by most of these countries, however.

As the traditional army food, beans accounted for a large part of the increase in U.S. food production during World War II. There had been a general upward trend. in bean production after 1909 in the U.S., although prices were erratic. A poor crop in 1936 pushed prices to the highest point in five years, but in 1937 better yields brought production up to a new record and prices declined. With the outbreak of World War II acreage expanded, yields were good and total production reached a high point in 1943 almost double that of 1936. The crop of 1943 was estimated at 19,433,000 one-hundred-lb. bags (cleaned basis), which compared with less than 10,000,000 bags raised in any year before 1929 except one, 1925. In 1944 a lower yield per acre reduced production to about the average of the ten years 1934-43, or about 16,000,000 bags. In 1945, acreage dropped about 25% and although the yield was good the crop was the smallest after 1936. The need was estimated to be smaller, and the goal for 1946 was set at 15,000,000 bags by the U.S. department of agriculture.

Noncivilian requirements took about one-third of the output in 1943 and 1944. Exports increased from about 88,000 bags in 1937 to 1,545,000 bags in 1940 and to 2,870,000 bags in 1942. The demand for military purposes declined with the reduction of the armed forces and was estimated to be only 1,800,000 bags for the 1946-47 season.

Prices to producers of beans advanced from \$3.10 per 100 lb. in 1937 to a high of \$6.15 per 100 lb. in 1944 and to \$12.50 in November 1946. In 1917 a top of about

Beaverbrook, William Maxwell Aitken

Baron Beaverbrook (1879-), British publisher and statesman, was born May 25, 1879, the son of a Scotch Presbyterian minister who lived at Newcastle (New Brunswick), Canada. Educated in Newcastle public schools, he started his career in journalism as a newsboy. He later entered business, formed a successful merger that netted him a fortune and then went to London. There he entered politics and was elected member of parliament in 1910 for Ashton-under-Lyne. He served with the Canadian expeditionary force in France in 1915, was elevated to the peerage as Lord Beaverbrook in 1917, and was appointed chancellor of the duchy of Lancaster and minister of information in 1918. Meanwhile, he bought (in 1917) a controlling interest in the London Daily Express and by 1930 had built up the paper's circulation to more than 2,500,000. He also became publisher of the Sunday Express and the Evening Standard. Lord Beaverbrook entered the Churchill coalition cabinet on May 14, 1940, as minister of aircraft production. Criticism of his work led to his removal and on June 29, 1941, Churchill named him minister of supply. Lord Beaverbrook represented Britain at the U.S.-British-Soviet parley that opened in Moscow, Sept. 29, 1941. After his nomination, in Feb. 1942, to the newlycreated ministry of production, Beaverbrook served 15 days and then left for "reasons of health." He then actively stumped for aid to the U.S.S.R. and a prompt opening of a "second front." In Sept. 1943, Beaverbrook returned to the Churchill cabinet as lord privy seal. In the summer of 1944, he headed the British delegation that conferred in Washington, D.C., with U.S. officials on joint Anglo-U.S. policies on world oil resources. He was opposed to both the Bretton Woods agreement and the British loan from the U.S. on the grounds that they would threaten the economy of the empire.

Beck, Josef

Beck (1894-1944), Polish statesman, was born Oct. 4, 1894, in Warsaw. He enlisted in Joseph Pilsudski's Polish legion in 1914 and served on the Polish general

staff during the conflict with Russia in 1919-20. Beck was military attaché in Paris, 1922-25, and in 1932 became foreign minister in the Pilsudski cabinet. This post he retained until the German invasion in 1939. As Hitler's armies overran Poland in Sept. 1939, Beck fled to Rumania with other members of the Polish cabinet. Although interned in Rumania, he was said to have exerted longdistance pressure on Polish officialdom in London, and his strongly anti-soviet clique in the Polish government-inexile was said to have had considerable influence in blocking Polish-soviet rapprochement. Beck's influence in London waned considerably, however, when Wladyslaw Sikorski and later Stanislaw Mikolajczyk headed the Polish cabinet. Beck died June 6, 1944, near Bucharest, according to a broadcast by a nazi-controlled radio station in Rumania.

Beekeeping

The production of U.S. honey had been declining for several years prior to World War II, and the average was about 160,000,000 lb. annually. The number of beekeepers in the U.S. was estimated at about 800,000 and the number of colonies 4,500,000. It had become a widely distributed agricultural enterprise, called a \$10,000,000 industry. The principal causes of the decline were the low prices, droughts and the reduction in buckwheat pasture for the bees. With increased demand for honey to replace sugar and its wider use in industry, production increased to 180,000,000 lb. in 1942, and to a high total of 225,779,000 lb. in 1945. The average production per colony was

Women volunteers working at beehives during World War II, when replacements were needed for male workers on leave for military duty or defense work

41.3 lb. and the number of colonies was reported at 5.566,000—24% above the low year 1939. Prices were well sustained because of the shortage of sugar. A large proportion of the crop was used by industry in baking, ice-cream and syrups.

Honey Production in the United States, 1939-46

								1··· F-	4,								
								180,474,000	1943								189,867,000

								221,959,000									225,779,000
1942	٠	٠	•	•	•	٠	٠	177,672,000	1946	٠	•	•	٠	٠	٠	٠	213,814,000

The price of honey at principal wholesale delivery points doubled between 1937 and 1946. Comb honey brought an average of \$3.64 per case in 1937 and \$5.40 in 1943. Extracted honey, California white orange, was 61/4 cents per lb. in 1937 and 12 cents per lb. in 1943. The prices varied greatly between regions and states. For example, the average price received by beekeepers in 1943 in New Hampshire was 29.4 cents per lb.; in Connecticut it was 17.1 cents, while in the western states the price ranged from 19.3 cents in Oregon to 13.4 cents in California.

Belgian Colonial Empire

Situated in equatorial Africa, the Belgian colonial empire consists of the colony of Congo and the adjacent mandated territories of Ruanda and Urundi. It has a narrow access to the Atlantic ocean on the northern shore of the Congo river estuary, but otherwise is surrounded by French Equatorial Africa in the W. and the N., by British possessions in the W. and the S.W., and by Portuguese Angola in the S.E. Total area: 923,270 sq.mi.; total pop. (est. Jan. 1, 1946): 14,336,000 (33,787 whites including 23,506 Belgians).

Congo.—Area: 902,040 sq.mi.; pop. (1939 census): 10,304,084 including 10,278,875 natives; (est. Jan. 1, 1946) 10,491,000 including 10,459,000 natives. In 1939 there were in the Belgian Congo 24,615 Europeans, including 17,536 Belgians, 1,543 Portuguese, 1,483 Italians, 1,041 British, 767 Greeks, 658 Americans, 489 Dutch, 415 French, etc. The Europeans in 1938 included 1,946 officials, 3,284 Christian missionaries, 5,346 employees of companies and 2,016 settlers.

On Jan. 1, 1946, the white population was estimated at 31,787 of whom 22,306 were Belgians; this European population included 3,287 officials, 3,837 Christian missionaries, 8,683 employees of companies and 2,773 settlers. Chief towns (1938 census): Léopoldville (cap., 30,582 natives, 2,315 Europeans), Elisabethville (36,422 natives, 2,572 Europeans), Jadotville (17,354 natives, 1,084 Europeans), Stanleyville (9,388 natives, 610 Europeans); on Jan. 1, 1946, the pop. of Léopoldville was estimated at c. 120,000 natives and 5,385 Europeans. Languages: Kis-

wahili is spoken by the natives who have been under Arab influence, Bangala and Kigwana are the languages on the Upper Congo, Kikongo is used near the coast, Tshiluba in the south and Lomongo in the central regions. Religion: mainly fetishism. Governors: Pierre Ryckmans (Sept. 1934–July 1946); Eugene Jungers (appointed Dec. 31, 1946).

Ruanda-Urundi.—Area: 21,230 sq.mi.; pop. (est. 1938): 3,752,742; (est. 1946) 3,845,000. In 1938 there were 932 Europeans including 609 Belgians; the Europeans included 143 officials, 307 Christian missionaries, 140 employees of companies and 46 settlers; in 1946 the white population was estimated at c. 2,000 including 1,200 Belgians. The territory is populated by three races: the Batutsi, the Bahutu and the Batwa. Chief town: Usumbura (cap., no census taken). The territories of Ruanda and Urundi were united administratively with the Congo, under the direction of a vice-governor, a post occupied by M. Jungers throughout the decade 1937–46.

The foundations of the big economic development of the Belgian Congo were laid mainly between the years 1918 and 1930. It was during that period that all the existing railways were built, the port of Matadi was modernized, the first motor roads laid out; it was also during that period that new cultivations and industries were started: cotton, coffee, oil palm and rubber plantations, cotton mills, sugar and cement factories, numerous oil mills, breweries, etc. After 1930, and during six years, the Belgian colonial empire felt heavily the effect of the world depression; public expenses had to be drastically curtailed, the number of officials reduced; numerous young enterprises were not able to survive and many other had to be assisted financially by the government. This situation improved from 1937 onwards through an increase in the world prices for tropical produce.

In World War II.—After outbreak of World War II the Congo—like Belgium—remained neutral for eight months, the communication between Belgium and the colony becoming, however, increasingly difficult. On the invasion of Belgium by Germany, the Congo entered the war. But, very quickly after the capitulation of the Belgian army, the Congo was completely severed from the mother country. The governor general, Pierre Ryckmans, kept the Congo in the war on the side of the Allies. Soon, however, the economic situation became critical; in anticipation of the war, large stocks of imported goods had been made, but nobody bought the produce by which the Congo had to live. Production was brought to a standstill.

At the end of 1940, Great Britain sent to the Congo an economic mission headed by Lord Malcolm Hailey whose negotiations led to the conclusion of a financial and economic agreement. The Congo entered the sterling area; any surplus of gold or foreign exchange above the requirements of the Congo and of the Belgian government in exile was to be sold against sterling to the British government. Great Britain undertook to buy fixed quantities of the main Congo produce at agreed prices. The rate of exchange of the Congolese franc was maintained at 176.50 fr. to the £. Immediately after this agreement was concluded, production started again. After Pearl Harbor, when the far east was lost and with it the main supply source of the most valuable raw materials, the importance of the Belgian colonial empire increased. A civil mobilization was ordered, and the production of strategic war materials increased to the utmost.

The war effort of the Belgian colonial empire yielded

appreciable results in stimulating agricultural and mineral production. At the same time, as no one could predict when the war would end, oil palm plantations were extended from 185,250 to 294,400 ac., and rubber plantations from 49,400 to 180,300 ac.

At the outbreak of World War II the Belgian colonial empire had a small military force of some 15,000 men. This was expanded to 35,000 men. In 1941, an expeditionary force was sent to Ethiopia, and assisted the British army and the Ethiopian partisans in the liberation of the country; they won the victory of Saio, where 15,000 Italians with 9 generals surrendered to the small Belgian force of 2,000 men.

In 1942, a fully equipped expeditionary force of some 12,000 men was sent to Nigeria, in order to assist in the

liberation of French West Africa. In 1943, after the invasion of northern Africa and the surrender of French West Africa, this force was sent to the middle east, and kept ready to assist in the liberation of Europe. In 1944, however, objections were raised against the use of Negro troops in Europe, and the Belgian expeditionary force was sent back to the Congo.

World War II had a profound influence on the Congo. On the one hand, it stopped for six years any extension of educational and medical programs. On the other hand, it accelerated in many respects the pace of the evolution of the Congo, both as regards white settlers and natives. Europeans, cut off for six years from their respective mother countries, considered the Congo as their home more than previously, and were asking for a larger share in the administration of the colony. The natives, despite German propaganda between 1940 and 1942 magnifying the military successes of the axis, remained absolutely loyal and co-operated wholeheartedly in the war effort. But those who had received some education, and mainly those living in large cities, became more self-conscious.

Postwar Period.—At the beginning of 1945, there were in the Congo and in the territories of Ruanda and Urundi 290 doctors, 135 European sanitary agents, 338 sisters and nurses, 557 native medical assistants, male and female nurses and midwives. The death rate among Europeans in 1944 was only 7.48 per 1,000, despite a much larger number of women and children, and, for many people, a prolonged stay in the tropics.

At the beginning of 1946, new social legislation was introduced. For white employees a system of old age pension, pension in case of invalidism and of compensation in case of accidents, was introduced. For the natives, professional trade unions and various bodies in which native workers and European managers could discuss together all problems relating to native employment were organized.

It was decided to reorganize the Congo administration on a principle of decentralization. The public expenses of the Congo increased considerably: the budget estimate for 1947 amounted to B.Fr. 2,500,000,000. Industry was developing fast. The opening was foreseen in 1947 of a number of factories. A central institute for high scientific research was about to be established. European settlement was encouraged and assisted, mainly in the more healthful southern and eastern areas. The formerly mandated territories of Ruanda and Urundi were placed under trusteeship of the United Nations.

Belgian Literature

One cannot say that a particular man or a particular work made any marked impression during the decade 1937-46; but writers abounded. Where they succeeded best was in poetry, monographs and the essay. The novel and drama showed less assertion. Nevertheless, certain dramatic works seemed to sound a new note, for instance Godefroid de Bouillon (Herman Closson), La Matrone d'Ephèse (Georges Sion), Le Burlador (Suzanne Lilar). Some novels also should be recorded: Printemps chez les Ombres (Alexis, Curvers), Panique en Occident (José-

André Lacour), Marais (Dominique Rollin), L'Egrégore (Pierre Nothomb), Françoise ou la Mort des Amants (Arnold de Kerchove), Week-end aux Tropiques (Adrien de Meeüs), La citadelle Bauduin (O. P. Gilbert). The best of the poetical production of 1930-40 was brought together in the Anthologie de la Décade. It can be said that the decade 1937-46 was one of great Belgian poetical activity, but nothing of surpassing merit was published.

Among many books of essays and historical subjects the following were noteworthy: Mahomet et Charlemagne (Henri Pirenne), Le Grand Héritage (Luc Hommel), Les Droits de la Cité (Henri Haag), Joseph Lebeau (Fernand Daxhelet), Les Eternels (Gaston Colle), Guillaume de Saint-Thierry (Dom Déchanet), Erasme (Marie Delcourt), Léopold III (G. H. Dumont). Among books of meditation, controversial and mystical, the following were outstanding: L'Incarnation de l'Homme (Marcel de Corte), Dialogue de l'Homme et de Dieu (Canon Leclercq), L'Oeuvre de Rome (Roger Goossens). Four books of criticism should not be omitted: L'Ecole de Laethem-Saint-Martin (Paul Hassaerts), Gustave De Smet (P. G. Van Hecke and E. Langui), L'Elément Flamand dans Beethoven (Ernest Closson) and Le Théâtre, cet Inconnu (Herman Closson). Few accounts of travel appeared; one should mention nevertheless Sur la Crête des Andes en Auto (Hubert Carton de Wiart), Les Bêtes Sauvages de l'Amazone and Le Mystère de l'Orénoque (Marquis de Wavrin).

The booksellers' demands were closely associated with the publishers' activities. To the enterprise of such already old firms as Desclée de Brouwer, Renaissance du Livre and the Office de Publicité was added that of new firms or of firms under a new name such as Presses de Belgique, Editions Dessart, Solédi, Casterman, Editions Lumière, Editions de la Sixaine, etc. These firms increased the number of anthologies and translations. Some of them had business connections with publishers in Paris and issued editions jointly with them.

Most of the Belgian reviews changed during World War II into "collections" or anthologies among which should be mentioned the following: Bâtir, Vivre, Collection Nouvelle des Classiques, Collection Lebègue, Collection Nationale and Saints de Nos Provinces. These brought about an astounding increase in the number of monographs, biographies, re-editions of French and foreign classics, popular pamphlets on history, science and religion—nearly all of extremely good appearance and decidedly useful.

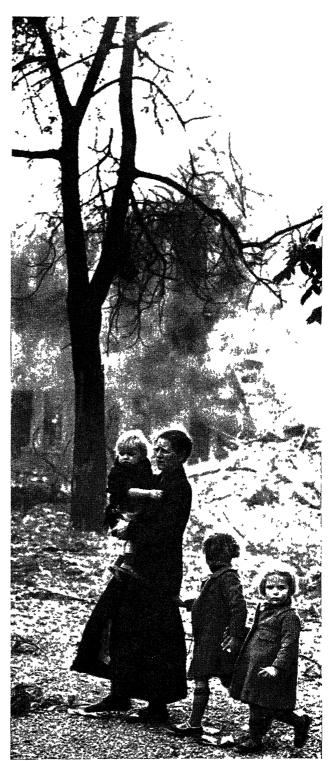

After the liberation certain old reviews reappeared: Le Thyrse, Cahiers du Nord and Etudes Carmélitaines. Others were transformed like the Revue Générale Belge which was the result of the fusion between the old Revue Générale and the Revue Belge, and new reviews were launched such as the Revue Nouvelle, Construire, Carnet du Séminaire des Arts, La Maison, Architecture and Solstice (quarterly articles on literature).

The works of writers such as Georges Simenon, Charles Plisnier and Henri Michaux were more properly connected with Parisian literature.

Belgium

A nation of western Europe, Belgium is bounded on the west by the North sea, on the north and east by Holland, on the east by Germany and the Grand-Duchy of Luxembourg and on the south and west by France. Area: 11,775 sq.mi.; Pop. (1937) 8,361,220; (May 31, 1946) 8,355,232. Chief towns (1945): Brussels: (cap. 1,282,438); Ant-

Belgian children clinging to their bewildered mother after being bombed out during a German air raid in May 1940

werp (767,619); Liége (534,725); Ghent (435,278); Mons (247,812); Namur (209,080). Languages: Dutch, French and German. Religion: Christian (chiefly Roman Catholic). Head of state: King Leopold III, Prince Charles acting as regent after Sept. 20, 1944. Prime ministers: Paul van Zeeland (June 13, 1936–Oct. 25, 1937); Paul-Emile Janson (Nov. 24, 1937–May 15, 1938); Paul-Henri Spaak (May 15, 1938–Feb. 9, 1939); Hubert Pierlot (Feb. 21, 1939–Feb. 7, 1945); Achille van Acker (Feb. 12, 1945–July 16, 1945, and Aug. 2, 1945–Feb. 18, 1946); Paul-Henri Spaak (March 13,

Belgian priests crossing a bridge destroyed by the demolition squads of retreating Germans, at Namur, Belgium. Namur was liberated by the Allies early in Sept. 1944

1946–March 21, 1946); Achille van Acker (March 31, 1946–July 9, 1946); Camille Huysmans (after Aug. 2, 1946).

Policy of "Independence."-Belgium in the year 1937 adopted an entirely new foreign policy. Actually, it was on Oct. 14, 1936, that King Leopold III had called together his ministers in order to inform them of his anxiety in face of certain facts of more and more agonizing significance: the extraordinary rearming of Germany, the transformation of the methods of warfare, the reoccupation of the Rhineland, the failure of all the international covenants and of the League of Nations. Winding up this memorable speech, the sovereign had proposed to his government the return to a foreign policy which should be "completely and exclusively Belgian," likewise the creation of a military instrument strong enough to deter any would-be invader. The change of policy recommended by the king had been approved by his ministers unanimously. These, in their turn, had received the solid support of the chamber, on Oct. 28, 1936, by 126 votes to 42.

The British and French governments were quick to recognize the absolute legitimacy of the new international position adopted by Belgium. On April 24, 1937, an offi-

cial document was handed to Paul-Henri Spaak by Jules Laroche, the French ambassador, and Sir Esmond Ovey, the British ambassador. By this instrument, France and England freed Belgium from her obligations resulting from the Treaty of Locarno and other agreements, while at the same time maintaining their promise of assistance in case of invasion. After a series of discussions which lasted several months, on Oct. 13, 1937, the third reich made a declaration similar to that of the French and English. Thus, the so-called policy of "independence" found itself confirmed on the international plane.

Internal Foment.—Completely united so far as the foreign policy of their country was concerned, the Belgians were not so united in internal politics. It was the pro-fascist Rexists who opened hostilities. By provoking a by-election in Brussels, Léon Degrelle tried to measure his strength with that of the prime minister, the candidate for all the other parties. On April 11, 1937, Paul van Zeeland obtained 276,000 votes, while his opponent collected only 69,258. Patently, the Rexist party was disintegrating. But Van Zeeland soon had to face a second attack, brought on by certain unusual operations carried out at the National Bank. Finding himself involved, and in order to defend himself more easily, he resigned on Oct. 25, 1937. A prolonged crisis ensued. On Nov. 24, Paul-Emile Janson managed to form a three-party ministry which remained in power till May 15, 1938.

On that date, Paul-Henri Spaak took over from his uncle. The economic position of Belgium was far from flourishing. The upward movement in trade and industry recorded unvaryingly between 1935 and 1937 had ceased. Between 1937 and 1938 exports dropped from 25,500,000,000 to 21,724,000,000 Belgian francs. The production of cast-iron and ferrous alloys went down from 4,180,000 short tons to 2,750,000, while that of steel fell from 4,290,000 short tons to 2,530,000. In the Belgian Congo the production of copper and manganese declined in like proportions. As for unemployment, by the end of 1938 it had increased by 38%.

The causes of this retrogression lay in the creation of autarchies and closed economic boundaries, as also in the threats of a second world war. These threats became dangerously acute in Czechoslovakia and absorbed the whole attention of Spaak. In Sept. 1938 the Belgian government undertook a partial mobilization and the placing on a war-footing of 12 infantry divisions. Belgium remained calm, the franc maintained its value and the storm passed. This lull perhaps deceived the political parties, which started to quarrel over the recognition of the Spanish government of Burgos. On Jan. 21, 1939, Spaak reconstructed his government, by strengthening the influence of the Catholics at the expense of the Liberals. The latter replied by criticizing the appointment to the Flemish Academy of Medicine of Dr. Maertens, who had been actively pro-German during World War I. The matter was sufficiently serious for the king to find himself compelled to summon his ministers in order to remind them of the regular free-play of parliamentary institutions. On Feb. 9, 1939, Spaak's government fell.

Hubert Pierlot attempted to form a Catholic-Socialist cabinet, but he had to give up the project after a week. Belgium could, literally, no longer be governed. On March 6, the king signed a decree dissolving the chambers and fixing elections to the legislature for April 2. At the same time he appealed to the good sense of the Belgian people and invited them to look beyond their own frontiers. The elections of April 2 went very much in favour of the parties representing order. The Catholics obtained 73

seats (+10) and the Liberals 33 (+10), whereas the Socialists dropped to 64 (-6) and the Rexists to 4 (-17). The Communists maintained their position (9 seats) and the Flemish Nationalists improved theirs by only one seat (17) in all).

Following the indications on the part of the electors, Pierlot formed, on April 18, 1939, a Catholic-Liberal ministry. By 104 votes to 84 he was granted special powers of which he made skilful use. The budget prepared for the fiscal period 1939–40 was balanced and 5,000,000 francs in gold, which had left the country in 1938, were returned to Belgium. The index of industrial production rose from 86% to 111%.

International events interrupted this welcome readjustment. In Aug. 1939 the Belgian government hastily recalled certain special units to the colours. On Aug. 23, the U.S.S.R. and Germany signed a "non-aggression" pact. A day later in the name of all heads of state belonging to the Oslo group (Denmark, Finland, Luxembourg, Norway, Holland, Sweden and Belgium), whose foreign ministers had assembled in Brussels, King Leopold III addressed to public opinion throughout the world an appeal in favour of a "peace based on respect for the rights of all nations." The British, French and U.S. governments expressed their liveliest sympathy with this message to which, by contrast, Germany, Italy and the U.S.S.R. made no reply. On the evening of Aug. 28 the catastrophe seemed imminent. Queen Wilhelmina of Holland and King Leopold tendered their "good offices" to Britain, France, Poland, Germany and Italy, whose ambassadors were summoned in turn by Mr. Pierlot, in Brussels, and by Eelco Nicholaas van Kleffens, at the Hague. But Germany had already decided on war; on Sept. 1 her troops were invading Poland.

Eight Months of Neutrality.—The attitude of Belgium towards the conflict was clearly indicated; it proceeded entirely from that "policy of independence" adopted in 1936. It left no occasion for the slightest misunderstanding. As early as Sept. 3, the Belgian government made a declaration of neutrality, summarizing the obligations laid upon her by international law. On the same day the king requested Pierlot to broaden his ministry by bringing into it five socialists. Belgian neutrality was in complete accord with the defensive plans of Britain and France. It gave these two countries time to catch up with the considerable start which they had allowed Germany to be given in the field of armaments. Furthermore, the Belgian government did not remain inactive. It mobilized 650,000 men, or approximately one-eighth of the population, and increased the fortifications. Besides this, the army general staff made direct contact with the commander in chief of the Franco-British armies, in order to make certain that the latter had all the necessary data at his disposal, in case of an eventual armed intervention. Nevertheless, in accordance with her obligations as a neutral state, Belgium rejected the French demands to open immediately her frontiers to the Allied troops.

On April 16, 1940, in the senate, the foreign policy of the government was approved by 131 votes as against 3 hostile votes coming from the Communists and 2 abstentions. Such evidence of unanimity was not repeated with the same force in regard to internal matters. On April 25, the Liberal deputies voted against the budget for the ministry of public education, for reasons of a linguistic nature. The Liberal ministers took the negative vote on the part of about 20 of their political confrères as reflecting a personal lack of confidence. Without having been outvoted in parliament, the prime minister tendered his

resignation to the king. But Leopold III refused categorically to accept it. "The present time"—he wrote to Pierlot—"is not a suitable one for an open ministerial crisis on questions of internal politics." Four days later Hitler started his blitzkrieg.

Eighteen Days' Campaign.—At dawn on May 10, 1940, without an ultimatum or declaration of war, the German armies invaded Belgium. Their first attacks were launched against Limburg, to the west of the lower Meuse. They were accompanied by violent bombardments and large-scale dropping of parachutists.

On the covering line of the Albert canal, the Belgian troops held out until the arrival of the Allied expeditionary corps. They then withdrew, as prearranged, to the real line of defense K./W. (Konigshoycke-Wavre), where a junction of the forces was effected, the latter resting on the Escaut, the Dyle and the Meuse south of Namur. However, on the night of May 14–15 the hinge-point of Sedan collapsed under the pressure of the German armoured divisions, which immediately began to race towards the sea. The Belgian front was left dangerously exposed. Owing to the defeat of the French at Sedan, Leopold III was forced to order the highly-fortified line K.W. to be abandoned in favour of improvised defense positions. This was done with the approval of General Maurice Gamelin, then commander in chief of the Allied land forces.

Between May 15 and 17 the Belgian army carried out its withdrawal while engaging the Germans. Then, having taken up strong positions along the Escaut and the Ghent bridge-head, it kept in check the incessant attacks of the enemy. During three days, in spite of the absence of any Allied air support, it annihilated several German units.

Unfortunately, in northern France the disaster became accentuated. On May 21 the Germans reached Abbeville on the Somme. Day by day, hour by hour, the vise tightened its grip around the isolated Belgian army. As far as the latter was concerned, the war was lost; but the king held that he was in honour bound to continue resistance, in order to allow for the withdrawal of the French 6oth division and the evacuation of the British troops-nucleus of what was to become the army of liberation. On May 27, after having warned the Allied general staffs of his intention, the king, as commander in chief of the Belgian army, decided to send a deputation to the German high command to negotiate a truce. The situation was, moreover, strictly untenable. Hitler exacted unconditional surrender. The treaty of capitulation, signed on May 28 by General Hans von Reichenau for the German army and General Olivier Derousseaux for the Belgian army, carried with it only stipulations which were exclusively military. It concerned solely the troops which were surrounded. (See WORLD WAR II.)

Bondage.—King Leopold III did not wish to abandon his army, of which he was, according to the constitution, the commander in chief. He considered himself a prisoner of war and refused categorically to take any political decisions. On the other hand, his ministers had in most cases gone abroad. There was thus an absence of executive power. By virtue of an enactment of May 10, 1940, concerning the delegation of authority, the heads of department in the various ministries immediately assumed the administrative direction of the occupied country. On June 2, 1940, a senior German officer informed the heads of department of the appointment of General Alexander Ernst von Falkenhausen as governor general of Belgium and northern France. General Eggert Reeder was attached

Moving toward the Rhine, infantrymen of the U.S. 1st army advanced through snow-covered forests of Belgium during the winter of 1944

to him as president of the Militärverwaltung.

The history of the ensuing years could be summed up in four words: famine, arrests, deportations, assassinations. From the very beginning, and under a mask of correctitude, the Germans pillaged Belgium of her stocks of supplies and economic riches. Moreover, Belgian agriculture was incapable of supplying the 2,750,000 short tons of cereals annually imported before the war. Week by week, the state of health of the population deteriorated in an alarming manner. By way of example, the charitable organization known as "Winter Help" had to assist 1,768,000 inhabitants-or approximately one-fifth of the Belgian population. By going personally to Berchtesgaden on Nov. 19, 1940, King Leopold III extracted from Hitler a substantial improvement in regard to food supplies. This improvement was maintained, with various ups and downs, right to the end of the occupation.

Meantime, on May 12, 1940, General von Falkenhausen had issued a decree fixing the age-limit of civil servants at 60, instead of 65. This decision gave the Germans the opportunity of introducing their own men (mostly Rexists and Flemish Nationalists) into the highest departmental positions, as well as into the various branches of the administrative machinery. Then began the first arrests of hostages

and recalcitrant patriots, the regulations concerning forced labour (March 6, 1942) and the deportation to Germany of the 1920–24 classes of recruits (March 6, 1943). Once more, on this occasion, a violent protest by the king softened the harshness of the orders. Leopold III secured, in fact, the cancellation of those affecting the deportation of women, young girls, children belonging to prisoners of war and war orphans. Five hundred thousand Belgians thus escaped a dreadful fate.

The more clearly the outlines of an Allied victory began to shape themselves, the more heavily did the nazis bring their terror to bear on the Belgians. Patriots were taken away, in thousands, to torture and extermination camps. The royal family itself was not spared. On June 7, 1944, the king was arrested by the S.S. and taken off to Germany. Two days later, Princess de Réthy (with whom the widowed king had contracted a second marriage) and the royal children suffered a like fate. On July 13, 1944, General von Falkenhausen was replaced by the Gauleiter Joseph Grohé. The latter seemed determined to drown Belgium in a bath of blood. With his encouragement, those collaborating with the gestapo, Rexists, ex-legionaries against Russia and other traitors vilely assassinated dozens of prominent people. Fortunately, the armies of the Allies did not allow the S.S. and their hired assassins time to carry their plans to completion. With the enthusiastic support of the forces of the

resistance, under the leadership of General Yvon Gérard, the Allied armies put the Germans to flight. After 1,600 days of bondage, Belgium found herself again in possession of her sovereign independence.

To V-E Day.—On Sept 8, 1944, the Pierlot government returned to Brussels. It had been formed in London in Oct. 1940 with the object of organizing and increasing Belgium's contribution and that of her colonies to the war. Its efforts were not in vain: the economic support furnished by the Belgian Congo, for example, proved to be of the utmost value to the cause of the United Nations. The latter testified to the fact on several occasions. On Sept. 20, 1944, taking into consideration the fact that the king was held a prisoner by the Germans, both chambers in joint session elected his brother, Prince Charles, to the regency of the kingdom. A week later, Pierlot reshuffled his cabinet by bringing into it Belgians who had remained in their country.

The first task before the new government was the reabsorption of the inflated currency created by the Germans—the fiduciary circulation had increased from 28,000,-000,000 to 119,000,000,000 Belgian francs. On Oct. 9, 1944, Camille Gutt, the finance minister, effected a deflation on a vast scale, which rapidly brought down the notes' circulation to 21,000,000,000 francs. This reduction was, however, attenuated by two successive issues, but its effect was to stabilize the currency. The experiment carried out by Gutt was, unfortunately, warped by a sudden flare-up of the war. On Dec. 16, 1944, General Gerd von Rundstedt launched a violent offensive in the Belgian Ardennes, while the cities of Liége and Antwerp were subjected to murderous bombardments by flying bombs and rockets. The requirements of war naturally came before those of economic recovery. The new Belgian army which had just been raised took part in numerous battles against the enemy at bay. Accused of want of vigour and understanding, the Pierlot government resigned on Feb. 7, 1945, without even awaiting the verdict of parliament. On Feb. 12, Achille van Acker formed a ministry from which were excluded all the "London men," except Spaak, who kept the ministry of foreign affairs. On May 7, 1945, Germany capitulated. The same day, it was announced that King Leopold III and his family had been liberated by the American 7th army.

Revival.—The immediate postwar period in Belgium was marked at once by an exceptional political instability and, at the same time, by an undoubted economic revival. On the initiative of the Communist party and of a proportion of the Socialists, a dispute involving the king was started. Lengthy discussions were entered upon between Leopold III and the government. The latter, having pronounced itself in favour of an abdication by the sovereign, found itself broken up on July 16, 1945, owing to the resignation of all the Catholic ministers. A long parliamentary debate then followed which brought no new suggestions but merely complicated the situation.

A ministry of the left, formed on Aug. 2, 1945, by Van Acker, began to disintegrate at the very beginning of 1946, following upon "differences of opinion on matters of essential importance." On Jan. 9, the prince regent signed a decree dissolving parliament and fixing elections for Feb. 17. On Feb. 18 Van Acker resigned. The elections modified to a considerable extent the composition of the chambers. The Christian Socialist party (heir to the Catholic party) won 92 seats in the chamber of deputies (+ 19), the Liberal party 17 (- 16), the Socialist party 69 (+ 5), the Communist party 23 (+14) and the Democratic Union 1. In the senate, the Christian Socialist party occupied 83 seats, the other parties together making up 84. Owing to various

constitutional questions (especially the one concerning the king), any possibility of an understanding between the strongest party (Christian Socialists) and the other parties was effectively ruled out. Three prime ministers—Spaak, Van Acker and Camille Huysmans—tried, in vain, to resolve the deadlock, but without success.

In spite of the incoherence of its political situation, Belgium carried out a course of reconstruction which could not be paralleled in any of the other states formerly under

Belgian children sent to Switzerland by the Belgian Red Cross in 1945 for a three-month period to recover from the effects of bombings and under-nourishment

German occupation. In 1944, thanks to the commercial advances made by her under lend-lease, Belgium found herself a creditor of the Allies. This allowed her to import without encroaching upon her gold reserves, and to set her productive forces in motion. In 1946, industrial production had already attained an all-round 65% of its prewar volume. Recovery would have been still more marked if coal production had not remained stationary (77,697 short tons a day), because of the grave shortage of man-power.

The prosperity of Belgium was to be decided on the world markets. In 1946, the kingdom's exports amounted to about 26% of their average volume for the years 1936–38. Imports, on the other hand, had reached 55% of their prewar figure. In order to reduce this dangerous disequilibrium, Belgium was counting much on the formation of an economic union between Holland, Belgium and Luxembourg, which was agreed to in principle on Sept. 5, 1944, in London, by the Belgian and Dutch governments respectively. Thus, it would seem that economic considerations must draw together the three states which formerly composed the "Seventeen Provinces" of Charles V. (See also BELGIAN COLONIAL EMPIRE.)

Belgrade

Capital and largest city of Yugoslavia, Belgrade (Beograd) had a population of 238,775 by the census of 1931. In the early part of 1941, German-circulated leaflets accusing the Slavs of mistreating German minorities flooded Belgrade and other cities. After days of deliberation in the cabinet, Premier Dragisha Cvetkovitch signed a pact in Vienna on March 25 binding Yugoslavia to the

axis. So unpopular was this decision that the populace revolted two days later, forced the cabinet to resign, and overthrew the Regency of Prince Paul. The army under General Dushan Simovitch then proclaimed young Peter II king. The people were jubilant, but Germany was angered. On April 6, German planes attacked Belgrade and fired the city, which was soon occupied, and captured 12,000 troops. Shops were looted, inhabitants were killed and a wave of sabotage devastated the city. Four nazi administrators rose and fell, until Franz Neuhausen arrived as consul general to assume absolute control. Partisans fled to the hills and continued the fight despite their split into two camps. (See Yugoslavia.) Russian and Yugoslav troops recaptured Belgrade on October 20, 1944.

Benes, Eduard

Beneš (1884-), Czechoslovakian statesman, was born May 28, 1884, in Kožlany, Czechoslovakia, of poor peasants. Educated at the faculty of philosophy at Prague university, the Sorbonne and the Ecole de Science Politique in Paris, he was graduated with a doctor of laws degree from the University of Dijon in 1908. During World War I, he worked closely with Thomas G. Masaryk in Paris and other Allied capitals in publicizing the cause of Czechoslovak nationalism. After the war, he became foreign minister in the newly-formed Czechoslovak government and was premier of one short-lived government, 1921-22. Head of his country's delegation to the Paris peace conference, he was a member of the League of Nations council in 1923 and 1925. He actively agitated in favour of safeguarding the interests of the small states in Europe. A confirmed democrat, Dr. Beneš was president of Czechoslovakia from Dec. 18, 1935 to Oct. 5, 1938, when he resigned that office after the Munich agreement.

Benes went to the United States, where he lectured at the University of Chicago. Shortly after the outbreak of World War II, he organized the Czechoslovak National committee in France. Throughout the war years, he continued to direct the Czech government in exile at London. In Moscow, on Dec. 12, 1943, he concluded a Czech-soviet mutual friendship treaty. Subsequently he stated that while opposed to the concept of a Pan-Slavic bloc, he felt that collaboration between Slavic peoples would work to the "advantage of all Europe." Benes returned to liberated Prague in May 1945, and thereafter endorsed a number of sweeping measures submitted by his cabinet. He approved forcible evacuation of the large majority of Sudeten Germans from Czechoslovakia and of Hungarians from Slovakia. He signed a decree (Oct. 24, 1945), nationalizing the country's commercial banks, insurance companies, coal mines, mineral deposits, steel plants, the Bata shoe factories and 27 large Czechoslovak industries. On June 19, 1946, the Czechoslovak parliament re-elected Dr. Benes as president to serve until a new constitution was drafted.

Bennett, Henry Gordon

Bennett (1887—), Australian army officer, was born April 15, 1887, in Balwyn, Victoria, Australia. After studying at Hawthorne college, Victoria, he became a public accountant. In World War I, he was decorated several times and rose to lieutenant colonel and brigade commander in the Australian army.

Promoted to a major general in 1931, Bennett was in

command of Australian forces in the disastrous Malayan campaign in World War II. While Gen. Arthur Percival, the British commander in chief, was negotiating the surrender of Singapore on Feb. 15, 1942, Bennett and a group of British imperial officers escaped from Singapore in a Chinese sampan and reached Batavia. At the time, the Australian war cabinet approved his conduct in the Malaya battles with a vote of confidence on March 2, 1942. Later, however, Bennett was criticized by Gen. Thomas A. Blamey.

Bennett subsequently retired from the army, May 1, 1944, declaring that he had been forced out by Blamey—a charge denied by the latter.

In 1945, Bennett walked out of a military inquiry into the circumstances of his escape but testified at a public inquiry headed by Justice George Ligertwood in late December of that year. On Jan. 4, 1946, Ligertwood reported that Bennett was not justified in relinquishing his command and leaving Singapore before the surrender terms were completed. The justice added, however, that Bennett in deciding to escape was not conscious of the fact that he was committing a breach of his legal or military duty. The report cleared Bennett from charges that he had acted from motives of personal safety, declaring that his escape was inspired by patriotism and the belief that he was acting in the best interests of his country.

Benton, William

Benton (1900—), U.S. government official, was born on April 1, 1900, in Minneapolis, Minn. He was graduated from Yale university in 1921, and spent 1922—36 in the advertising agency business, the last six of these years in partnership with Chester Bowles, who later became Office of Price Administration administrator and director of economic stabilization.

A major turning point in Benton's career came when in 1936 he resigned as board chairman of Benton and Bowles and, after a world trip, accepted a vice-presidency of the University of Chicago in 1937, on a six months per year basis. At the university his main interest was in developing new instruments of education, notably broadcasting, motion pictures and publications. At Benton's instance the university entered into an association with Encyclopædia Britannica, Inc., of which he became chairman of the board in 1943. Under Benton's leadership Britannica entered the field of classroom motion pictures through its subsidiary, Encyclopædia Britannica Films Inc.

During his "free" six-months periods, Benton participated in founding the Committee for Economic Development, of which he was vice-chairman of the board of trustees; assisted Nelson Rockefeller in the latter's work as co-ordinator of Inter-American affairs; and acquired ownership of several small companies in the fields of music publishing, broadcasting service, and "wired music," with the Muzak corporation as key company.

In Aug. 1945 Benton was appointed assistant secretary of state for public affairs, and was sworn in on Sept. 14. He gave up all of his outside interests which involved operating responsibilities, including the board chairmanship of Britannica and the vice-presidency of the University of Chicago (of which he remained a member of the board of trustees), in order to devote himself to his new duties. These duties included helping to bring to the U.S. public a closer understanding of problems and policies in the field of foreign affairs; responsibility for U.S. participation in the United Nations Educational, Scientific and Cultural organization; and the development of a program for projecting to foreign peoples "a full and fair

picture of American life and of the aims and policies of the United States Government." On Jan. 1, 1946, Benton presented a program for the latter task which called for the maintenance of staffs of public affairs officers attached to U.S. embassies and legations abroad; use of international broadcasting from the U.S. in 24 languages; use of documentary motion pictures for exhibition noncommercially abroad; a fast service to foreign editors and publicists on full texts of important statements and a documentary service on background material; maintenance of U.S. information libraries in some 70 key cities abroad; and a plan for the exchange of students and scholars with other countries. This program represented a new departure for the U.S. in its peacetime foreign relations. On July 1, 1946, the congress voted approximately \$25,000,000 to support the program during fiscal 1947.

Bentonite

The demand for bentonite in the United States increased so consistently that the output made a new record high in every year from 1933 to 1945, with the exception of 1938. The trend of production and use is shown in the accompanying table.

Production increased almost threefold between 1937 and 1945; distributed by major uses oil refining increased 74%, foundry work 184% and drilling mud 336%; "other uses" increased more than sixfold, scattered among a wide variety of minor applications, none of which took more than a few thousand tons. The expanding demand for bentonite in oil refining was largely at the expense of fuller's earth. (See also Fuller's Earth; Mica.)

Beria, Lavrenti Pavlovitch

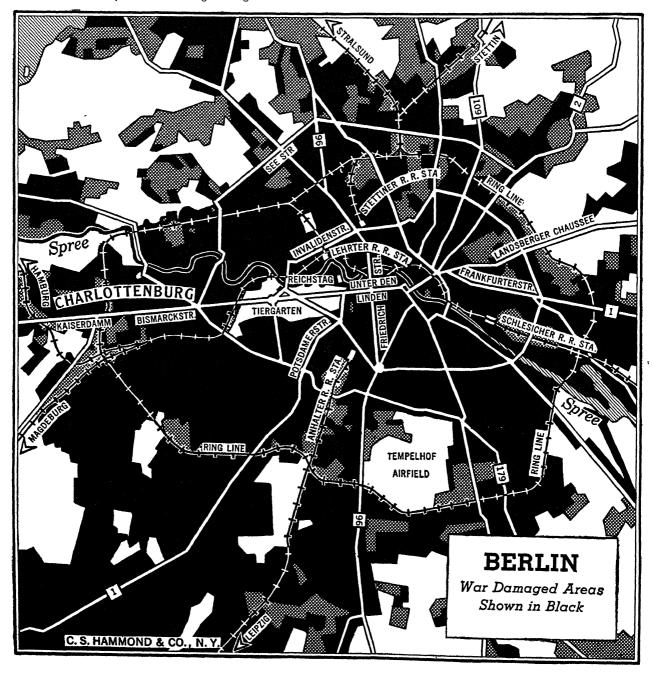

Beria (1899-), Russian government official, was born in Georgia in the Russian Caucasus. He joined the Communist party in Baku in 1917 and played an active role in the Russian Revolution. Beria subsequently rose to prominence in party ranks in his native Georgia and was chief of the public security organization in the Caucasus, 1921-31. He also was general secretary of the central committee of the Georgian section of the Communist party, 1931, and general secretary of the Transcaucasian Regional committee of the Communist party in 1932. During the great "purge" in 1938, he complained to Stalin that the O.G.P.U. had wrecked the party's administrative machinery in the Caucasus. Beria's complaint that the O.G.P.U. tactics had thoroughly demoralized the army and industry led Stalin to overhaul the dreaded secret police. On Aug. 12, 1938, he appointed Beria vice commissar of the commissariat of the interior (N.K.V.D.), in which the O.G.P.U. was incorporated. Beria became head of the N.K.V.D. on Dec. 8, 1938, and in this capacity halted mass expulsions from the party and restrained the

secret police. After the start of the German invasion, Stalin appointed Beria to membership July 1, 1941, on the newly-created State Committee of Defense. On July 20, the same year, the commissariats of internal affairs and national security, which had been separated, were merged again into the united N.K.V.D. and placed under Beria. As head of the commissariat for internal affairs, Beria administered what was virtually his own army and militia. His special job on the defense committee was organization of the armaments industry. Beria, who also became vice chairman of the Council of People's Commissars, was one of the alternate members of the politburo. He was appointed to the Committee for the Economic Rehabilitation of Liberated Areas in 1943. During World War II, he was elevated to the rank of marshal. On Jan. 14, 1946, it was announced that Beria had been replaced as head of the N.K.V.D. by Col. Gen. Sergei Kruglev.

Berlin

Capital of the German reich from 1871 to 1945, Berlin was the largest and most important city of Germany. Reorganized in 1920 to include several suburbs, greater Berlin had an area of 341 sq.mi.; pop. (census 1933) 4,236,416, (census 1939) 4,332,242, (est. 1946) 3,200,000.

Its favourable position in north Germany on the river Spree, between the Elbe and Oder rivers, afforded it cheap water transportation through Germany's wide-reaching system of rivers and canals. It was also the centre of Germany's network of railways, motor highways and commercial air lines. Politically important as the seat of the Prussian and German governments, it contained the great buildings of central administration as well as the principal banks, insurance company offices and other financial institutions. In the suburbs were numerous large industrial plants, the most important of which were metal, electrical and munitions works. All these factors made Berlin an

obvious target for Allied bombing in World War II, which wrought terrific havoc and destruction.

Hitler, with the aid of his architect and engineer, Albert Speer, inaugurated a grandiose construction program to transform the city. The Tempelhof airport was enlarged during the winter of 1937-38 to be the biggest in Europe, with a scheduled arrival and departure of 102 large planes every 24 hours. A great stadium and sport field was built in west Berlin for the Olympic games of 1936. A gigantic reichsbank, a 2,500-room aviation building for Hermann Goering's officials, a magnificent chancellery for Hitler himself, and many other imposing buildings were started or completed. At the laying of the cornerstone of the faculty of military science, the first building of the new Berlin university, Hitler declared on Nov. 27, 1937: "It is my unalterable determination to ornament Berlin with those streets, structures and public squares which will make it through all the ages the worthy capital of the German reich. The size of these projects will not be measured by the needs of 1937. They will be planned with the knowledge that it is our duty to prepare a city that will stand a thousand years, worthy of the immeasurable future of a nation with a thousand years' history." Vanity of vanities! Within eight years virtually all of them were a dismal mass of rubble and tangled steel.

Berlin was one of the most heavily bombed cities in the world during World War II. From the first Allied air assault on Aug. 25, 1940, until April 20, 1945, when the British royal air force finished with it, the city was blasted with 76,652 tons of explosives and incendiary bombs, 50,690 from bomber command planes, and 25,962 from the U.S. 8th air force. To lessen the danger from air attacks, the Germans camouflaged important landmarks like the east-west axis highway, west of the Brandenburg gate.

Thousands of children were sent for safety to other parts of Germany, and many official staffs were moved to small towns not far from Berlin.

Though many very heavy raids were made at various times during the war, the greatest destruction took place in the early weeks of 1945.

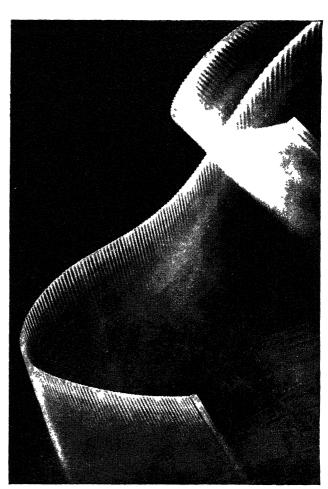

Most of the buildings in the heart of Berlin—the business and official districts along Unter den Linden, the Wilhelmstrasse and Leipzigerstrasse—and in several other areas were destroyed. It was estimated that 80% of the residential buildings were damaged and 20% rendered absolutely uninhabitable. Many families had to live crowded in cellars, half starved. Further frightful destruction was caused in the eight-day attack ending in capture of the city by the Russians early in May 1945. The Russians concentrated 40,000 tons of artillery shells on the city. During the first days after capturing Berlin, Russian soldiers freely robbed individuals, looted buildings, and raped women young and old in a most brutal orgy. Later, better discipline was established.

By the Yalta and Berlin agreements of Feb. and July 1945, Berlin was divided into four military areas: Russians in the east, U.S. in the south, British in the northwest and French in the north. The city was governed by a military board on which each of the four powers had a military representative. These men presided in rotation, but the efficiency of the board was greatly impaired by the difficulty of getting the four powers to agree on measures.

Bermuda

Bermuda is the largest of about 360 small islands approximately 580 mi. east by south of Cape Hatteras, N.C., and about 700 mi. from New York city. Area of the group (a British colony): 19.3 sq.mi.; pop. (1945 est) 35,-000. The census of March 26, 1939, gave a civil population of 30,814 (aside from semitransient tourists); the adjusted census population gave 31,481; an official estimate in 1941 was 32,451 (not including members of the armed services of the United Nations, U.S. army and navy base personnel, and imperial censorship employees); a 1942 estimate of the civil population was 32,857 and a 1944 estimate was 33,925. The capital is Hamilton, pop. (1945 est.) 3,500; population by the 1939 census was 1,863. The only other town of importance is St. George, pop. (1939) 2,665. Only about 16 of the islands are inhabited. Governors during the decade 1937-46: Sir R. J. T. Hilyard, until April 1939; Lt. Gen. Sir Denis K. Bernard, April 1939-Aug. 27, 1941; Viscount Knollys, Aug. 27, 1941-Aug. 24, 1943; Lt. Col. Lord Burghley, Aug. 24, 1943-Aug. 9, 1945; William Addis, Aug. 9, 1945-Jan. 23, 1946; Sir Ralph Leatham, after that date. Bermuda has a representative government including a legislative council of nine members (three officials and six nominated nonofficials) and a house of assembly of 36 members (four elected by each of the nine parishes). The

governor is assisted by an executive council of four official and three unofficial members.

* * *

BERMUDA's development during the decade 1937-46 hinged chiefly on its reorientation to wartime economic problems. This situation was especially serious inasmuch as the backbone of the colony's economy had been the tourist trade, and an average of 85% of government revenues had been derived from that trade. In 1937, 83,092 tourists visited Bermuda, the vast majority of them in British ships, although 90% were from the U.S. When a U.S. line in March 1938 tried to break into the trade by listing its ships as "hotels" while in port, the "ship-hotel" controversy began. A bill was introduced into the house of assembly in June of that year to prohibit use of ships as hotels, but it was temporarily abandoned on protests from the U.S. that it discriminated against U.S. shipping. A new law adopted in Aug. 1938 (effective Dec. 1) barred ship-hotels from Hamilton and St. George's harbours.

The outbreak of World War II in Sept. 1939 resulted in a serious decline in the tourist trade. It had been hoped that Bermuda, far removed from the original theatres of war activity, would attract many tourists who otherwise would have gone to Europe. That did not prove to be the case, chiefly because of fear of submarine attacks on shipping and the diversion of shipping to other purposes. Regular steamship communication between Bermuda and New York and European ports, normally maintained by British vessels, was seriously interfered with by the war. "Clipper" service by air between the U.S. and Europe was established early in 1939, with Bermuda as a port of call on the southern route, supplementing the already existing New York-Bermuda air service. Curtailment of plane services prevented use of that means of communication as a tourist substitute for steamers on any large scale, however. By 1942, the tourist trade had dropped to practically nothing; losses of ship-transported tourists were only partially offset by the increased transatlantic air travel which, in 1941, had brought a record 5,911 persons to Bermuda.

The changing nature of the war and especially the need of supplying the large military and naval personnel stationed in Bermuda brought about greatly increased shipping facilities in the early months of 1943. The large consignments of supplies transported to the islands resulted in occasional storage problems. The continued heavy transatlantic air travel, very largely for military purposes, brought about the creation in mid-1943 of an airport board to govern traffic and supervise airports and equipment. With progress of construction on U.S. naval bases, the government of that country adopted a ruling barring all tourists from islands in the western hemisphere where naval bases were under construction. With the end of the war, however, Bermudian officials began making plans for an early and large-scale revival of the tourist trade; it was anticipated that air-borne traffic, in view of

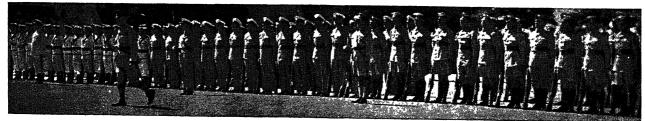

the wide expansion of such facilities for travel to Europe, would prove of especial importance.

The threat of war in 1939 which would involve the mother country resulted in increased war preparation throughout the year. A war service census was taken in March, gas defense drills were instituted and other steps were taken. When the war broke out in September, a state of national emergency was declared, by the terms of which the governor was empowered to rule by decree. Censorship of the mails was established, and conscription for defense purposes was put into effect. By the end of 1940 Bermuda had become a major centre of operations for prosecution of the war itself, as well as a potential base for the future defense of the western hemisphere. Its location in the western Atlantic made it a logical point of union for convoys bound from the U.S. and Canada to Great Britain; for similar reasons, Bermuda became an important station for examination, under the "navicert system," of neutral shipping bound to and from continental Europe. These varied wartime activities required a considerable enlargement of the naval and military establishments normally stationed at Bermuda from a March 1939 personnel of 1,098 to several times that figure. In addition, Bermuda became one of the leading sites for censorship of transatlantic mail; between 600 and 800 censors were located there to review mail to and from axis-controlled countries. Three of the leading hotels were commandeered to house this staff.

The executive agreement made by President F. D. Roosevelt and Prime Minister Winston Churchill in the summer of 1940 for the trade of 50 over-age destroyers in return for lease rights on various Atlantic naval and air base sites for 99 years involved Bermuda as one of the anticipated locations. The specific sites subsequently determined upon were on the east coast and on Great Bay. Initial contracts for construction work on these bases were let in the U.S. late in 1940. The U.S. in March 1941 formally took over 526 ac., a significant fraction of the colony's entire land area, for development of the bases. The main base was formally commissioned on July 1, 1941, as "Kindley field," and by the end of that year an estimated 4,500 U.S. marine and other forces were in Bermuda. Development of the bases was viewed with mixed reactions by the Bermudian population. It was realized that added prosperity would accrue to the colony, but the necessary eviction of families from the acquired areas aroused considerable local resentment, as did fears that sovereignty over the islands themselves might ultimately be transferred to the U.S. Such fears were vociferously aired in the house of assembly. The assembly also expressed its disapproval of the mother country's policy of appointing military men to serve as governors of the colony.

The anticipated prosperity materialized fully in 1942 and 1943 as the program of naval and air base construction got completely under way. The disadvantage of the

British sailors, marines and soldiers on the parade grounds of their barracks at Hamilton, Bermuda

situation was felt in the measure of inflation and the shortage of consumer goods which almost inevitably resulted. Construction activities tapered off rapidly in the latter part of 1943, as a consequence of which some departure of civilian labour was noted, although the scarcity of farm labour continued. Lord Burghley, governor in 1944, visited the U.S. in January of that year to discuss with Pres. Roosevelt and Secretary of State Cordell Hull various problems resulting from the program of naval base construction. These included problems of population pressure, food supply, imports of consumer goods, etc. A proposal was made on Feb. 18, 1944, for payment to Great Britain for the cost of the land used for U.S. naval bases but the assembly opposed a loan for this purpose because of doubt over the postwar status of the bases. Public opinion in the islands was aroused by a proposal made on Aug. 15, 1944, by Senator Kenneth McKellar of Tennessee that the U.S. should permanently acquire the various leased bases. Canada commissioned a naval training base in Bermuda on Aug. 1, 1944, and a British colonial office representative arrived four days later to discuss problems growing out of the bases.

The U.S. on Aug. 6, 1945, returned the small Ordnance Island to St. George municipal authorities, but U.S. naval officials a month later urged retention by the U.S. of its naval base in the islands. U.S. Representative Michael Bradley at the same time proposed British cession of the island base to the U.S. in part cancellation of lend-lease aid. Bermudian officials simultaneously proposed commercial use of Kindley airfield, operated by the U.S. army, but negotiations to that end encountered considerable delays. Canada had virtually closed its naval training base by Aug. 27, 1945, and formally announced its closing on Sept. 17.

The impact of the war brought the abandonment of one of Bermuda's most distinctive practices, the ban on use of automobiles. Gov. Hilyard resigned in April 1939 because of disagreement with the assembly over the latter's refusal to exempt him from the Bermudian law forbidding use of passenger motor cars. The house of assembly in 1941 provisionally lifted the ban as a wartime measure.

Automotive transportation was initially limited to government service, but a legislative act in 1942 permitted use of motor cars by doctors. Authorization was subsequently given the governor to permit the use of all types of cars on the highways and, in addition to the approximately 85 vehicles previously owned and operated by the insular and municipal governments, considerable numbers were imported for use in connection with naval base construction. The 38-year-old ban on private cars was finally and permanently lifted by action of the assembly on Aug. 2, 1946.

A minor controversy occurred between the U.S. and Great Britain in 1940 because of the allegedly excessive zeal displayed by British mail censors in Bermuda. This resulted in the temporary suspension of westbound stops at Hamilton by planes of Pan American Airways on its transatlantic line, although the controversy was later resolved and the plane stops resumed. The shipping shortage and the need of supplying naval and military personnel stationed in Bermuda resulted in 1942 in some food shortages and the beginning of a rationing program. Rationing and price control remained in effect in 1943 and 1944 and the latter was in part expanded. It was anticipated that the end of World War II would bring an early easing in the problem of supplying consumer goods, especially imported foods, and the first shipment of meat to reach Bermuda through commercial channels after 1942 arrived Sept. 3, 1945. With the end of the war, all shipping controls on cargoes from Canada and the U.S. were declared lifted on Aug. 30, 1945.

The colonial assembly in 1942 approved a long-range educational program involving an increase in the school-leaving age from 13 to 14 years, provision for manual training and a girls' domestic training system, agricultural education, and generally improved teaching standards and requirements. Other internal developments included the proposal, made by the government in 1943 in anticipation of the prospective completion of defense construction and its adverse effect on the financial structure, that an income

tax be adopted as part of the tax program to meet the expected decline in governmental revenues. The assembly rejected the proposal in June, however. In the same year the colony's first divorce law was enacted. The assembly also provided for a heavy increase in liquor taxes. As a wartime measure, the colonial government in 1943 provided an interestfree loan of £607,400 for aid to Great Britain. A war refugee conference, held in Bermuda early in May 1943, issued a brief report on May 9 which held in the main that the general problem of refugee aid should remain subordinated to the war effort; the conference was attended by both British and U.S. representatives.

Admiral Sir Ralph Leatham, appointed governor of Bermuda on Jan. 23, 1946, being greeted on his arrival at Hamilton by Mayor H. St. George Butterfield (right)

Liberalization of the suffrage, a problem of perennial concern in Bermuda, brought the return for amendments by the legislative council to the house of assembly on May 2, 1944, of a bill to establish woman suffrage. The bill was passed in modified form on May 12. A new climax in the struggle to establish woman suffrage came in the defeat on Feb. 17, 1945, of a motion offered in the assembly by Dr. A. E. Cann, a Negro member, providing for universal suffrage. The woman suffrage society was subsequently dissolved April 11.

The U.S. and the British commonwealth participated in a telecommunications conference opening at Hamilton Sept. 22, 1945. On Nov. 29 the conference announced agreement on maximum rates for telecommunications facilities and on Dec. 4 the eight countries participating signed an executive pact cutting international communications rates, ending monopolies in other countries, and giving the U.S. the right to maintain direct connections with certain British dominions and possessions. A civil aviation conference at Hamilton agreed on Jan. 15, 1946, on the mutual commercial use of nine military airfields built by the U.S. in British possessions in the North Atlantic and the Caribbean.

Dissatisfaction with administrative handling of various domestic problems led Dr. E. F. Gordon, president of the Bermuda Workers' association, to announce on March 4, 1946, that he would petition for the appointment of a royal investigating commission.

Berne

The city of Berne, Switzerland, (pop. 129,331), made capital of the Swiss confederation in 1848, is situated on a peninsula formed by the curving river Aar, commands wonderful views of the snowy Alps of the Bernese Oberland, and is a favourite resort for tourists. It is also famous for its five bridges over the Aar, its old arcades along the streets, its many museums and its university, whose students increased from about 1,500 in 1937 to 2,513 in 1944–45. The town library contains many valuable manuscripts and rare printed books. It is the seat of the national bank and is second only to Zurich as a Swiss

financial centre. It is as the capital of the Swiss republic, however, that Berne is most important. The federal parliament building, where the national legislature meets, contains also the offices of the federal executive and administrative bodies. As the Swiss government consented to take charge of the embassies and legations of many of the belligerent nations during World War II, this considerably increased the population and activity of the city and made up for the loss of the tourist trade caused by the war. Berne became a haven for many refugees from Germany and other warring countries. It became a meeting place and listening post for both belligerents and neutrals. Much of the Red Cross work in forwarding mail, packages and food to prisoners of war and civilian internees in Germany and elsewhere was carried out from Berne. It also remained the headquarters of many international associations, such as postal, telegraph, railway and copyright organizations.

Bernhard

Prince Bernhard of the Netherlands (1911—) was born June 29, 1911, in Jena, Germany, of the old German house of Lippe-Biesterfeld. He was christened Bernhard Leopold Friedrich Eberhard Julius Kurt Karl Gottfried Peter. He studied at Berlin university, graduating with the degree of doctor of law. After leaving the university, he joined the staff of the German chemical concern, I. G. Farbenindustrie, working in Paris, Berlin and Amsterdam.

Prince Bernhard, who became a naturalized citizen of the Netherlands in 1936, was married Jan. 7, 1937, to Crown Princess Juliana, only child of Queen Wilhelmina of the Netherlands. During the invasion of Holland in May 1940, the prince, who had sworn allegiance to the throne, fulfilled his pledge of loyalty to the Netherlands and fled with the royal family to England. A major general and rear admiral in the Netherlands fighting forces, he was appointed Sept. 3, 1944, by Gen. Eisenhower as commander of Dutch patriot forces. The prince promptly notified Dutch resistance elements to await his instructions before coming out in the open against the German occupation troops. After the collapse of the German armies in May 1945, Bernhard returned with the royal family to Holland. (See also Juliana.)

Beryllium

The salient figures in connection with production and consumption of ores of beryllium during 1937-45 were as follows, in short tons:

	World	U.S	U.S.	U.S.	Stor	cks
	Production	Production	Imports	Supply	Industry	Gov't
193 <i>7</i>	375	75	182	227	2	
1938	1,026	25	146	171	2	_
1939	676	95	459	554	2	_
1940	2,166	121	805	926	3	
1941	4,090	158	2,666	2,824	2,200	
1942	3,005	269	2,050	2,319	1,400	725
1943	5,101	356	4,840	5,196	1,036	2.513
1944	3,384	388	3,115	3,503	131	4,684
1945	854	39	1.201	1.240	90	4 497

Comparison of the above columns indicates that during the war years the United States absorbed 84% of the world output of beryllium ores, but actually used only 61%, the remaining 23% being left in stock at the close of the war. Of the U.S. domestic output, 77% came from South Dakota; imports came chiefly from Brazil, Argentina, India and Australia. The largest use of beryllium was in alloys with copper, and some pure metal was used as windows in X-ray tubes. The use of the oxide as a phosphor in the coating of fluorescent lights expanded

as this method of lighting grew in popularity. The oxide was also finding applications as a refractory.

It had been known since early in the 1930s that the bombardment of beryllium with alpha particles from radium liberated neutrons. This method of providing a neutron supply was used in some phases of the early work on the fission of uranium, during the course of the development of the atomic bomb, though other sources were used in the later production stages. Beryllium had also been used as a moderator, to slow down the speed of neutrons, but was abandoned in favour of graphite, which was cheaper and more readily adaptable. (G. A. Ro.)

Beveridge, Baron, of Tuggal

Lord Beveridge (William Henry Beveridge) (1879—), British economist and politician, was born in Rangpur, Bengal, March 5, 1879. He served in the government during World War I as economic adviser on several ministerial boards. After the war, he was director of the London School of Economics and Political Science (1919–37) and was a member of government committees on coal and rationing. He was named in 1940 as adviser on manpower and industrial capacity to the ministry of labour, and in June 1941 he was appointed chairman of the interdepartmental committee on social insurance and allied services with a view toward suggesting reform methods.

He submitted (Dec. 1, 1942) the celebrated "Beveridge Plan"—100,000-word document outlining a new social security system, which included recommendations for unemployment insurance, free medical and hospital treatment, child benefits, old-age pensions and marriage and death grants. (See Social Security.)

The Beveridge plan was termed "too radical" by some Conservative M.P.s; Labourites generally regarded it as a broad step toward socialization.

In Oct. 1944, he was elected to the house of commons on the Liberal party ticket, and on Feb. 7, 1945, he was named one of the Liberal party's vice-presidents.

He was defeated when he ran again during the national elections in the summer of 1945.

Beveridge was created a baron on June 12, 1946, and took the title Baron Beveridge of Tuggal.

Bevin, Ernest

Bevin (1881—), British labour leader and statesman, was born in Winsford, Somerset, England. Son of a farmhand, young Bevin was a truck driver in the Bristol area and became general secretary of the Transport and General Workers' union in 1922, holding that post until 1940. He played a leading part in the general strike of 1926 which was broken by Winston Churchill, who later offered Bevin a post in his cabinet. In 1937, he was appointed chairman of the General Council of Trades Union congress. An early opponent of axis aggression, Bevin frequently castigated Chamberlain's policy and in May 1940 he joined the Churchill wartime coalition government as minister of labour and national service; on Oct. 3, of the

same year, he was promoted to the war cabinet. Bevin was instrumental in speeding output of munitions and keeping labour difficulties at a minimum.

After the Labourite victory at the polls, Bevin was appointed foreign secretary (July 27, 1945), by Prime Minister Clement Attlee. He then superseded Anthony Eden at the Big Three's conference in Potsdam. Bevin was one of the major participants in the London council of foreign ministers in 1945 and ascribed its failure to Molotov's insistence that small powers be excluded from drafting the peace pacts. His views on atomic policy were expressed in his statement to commons of Nov. 7, 1945, that the U.S. and Britain should keep the "secret" of the atomic bomb for the time being. At the sessions of the United Nations security council in London (Jan.-Feb. 1946), Bevin defended use of British troops in Greece and Java, denied that they were "menacing peace," scored soviet activities in Iran and charged that the "real menace" to peace was "incessant propaganda from Moscow against the British Commonwealth." Bevin's heated exchanges with Andrei Vishinsky, the soviet delegate, highlighted the sessions. The British foreign secretary also attended the Big Four peace conference at Paris in the spring of 1946, and the subsequent Paris peace parleys, which ended Oct. 15. In the majority of cases, Bevin sided with his U.S. colleague, Secretary of State Byrnes, a policy which led an insurgent group of Labourites to demand his ouster on grounds that he was making common cause with "Wall Street imperialists." However, Bevin's foreign policy won a resounding 353 to o vote of confidence in the house of commons on Nov. 18, 1946; the rebellious faction within the Labour ranks abstained from voting.

Bidault, Georges

Bidault (1899—), French statesman, was born Oct. 5, 1899, in Moulins, France, of a middle-class family. Drafted into the French army in 1917, he served with occupation forces in the Ruhr in 1919 and returned to his studies after demobilization. Graduating from the Sorbonne with high honours, he taught history in secondary schools in Valenciennes and Paris. In 1932, Bidault founded the left wing Catholic newspaper, L'Aube, with himself as foreign editor and columnist. At the outbreak of World War II, he joined the army with the rank of sergeant. Taken prisoner, he was held in the reich until 1941. Upon his release, he joined the underground and in 1943, became president of the national council of resistance.

About two weeks after the liberation of Paris, Bidault was named foreign minister (Sept. 9, 1944), in Charles de Gaulle's provisional government. He headed the French delegation that attended the opening sessions of the United Nations in San Francisco in April 1945, attended the first council of foreign ministers in London in the fall of that year and the U.N. sessions in London in early 1946. At the Paris sessions of the council of foreign ministers and at the following 21 nations peace conference,

he generally aligned French foreign policy with the socalled "western bloc," although he was the most frequent dissenter among the Byrnes-Bevin-Bidault trio.

Following the elections of June 2, 1946, in which Bidault's party, the M.R.P. (Mouvement Républicain Populaire), emerged as the single strongest party in France, the constituent assembly elected Bidault as president of the provisional government. On June 24, he also formed a cabinet and thus became concurrently, president, premier and foreign minister of France. He was succeeded as premier by Léon Blum in Dec. 1946.

Biddle, Francis

Biddle (1886—), U.S. attorney and statesman, was born May 9, 1886, in Paris, France, and was taken to the U.S. in his infancy. He was graduated *cum laude* from Harvard university (1909) with a B.A. degree and started the practice of law in 1912 in Pennsylvania. In the Roosevelt administration, he was solicitor-general, 1940—41, and was appointed by Pres. Roosevelt to the post of attorney general in 1941. During World War II, Biddle championed civil liberties, frequently warning against mob hysteria in dealing with aliens whom he contended should be treated "without malice or race hatred." In June 1944, he defended the government's seizure of the Montgomery Ward plant in Chicago as a move in the public interest. He resigned May 23, 1945, and was replaced by Thomas C. Clark.

Some four months later (Sept. 12), Pres. Truman appointed Biddle as U.S. judge on the international tribunal that tried the German war criminals at Nuernberg. On Nov. 12, 1946, Pres. Truman announced that he had approved a recommendation made by Biddle that the United Nations establish a code of international criminal law. The president also disclosed that he had accepted Biddle's submitted resignation.

Bierut, Boleslaw

Bierut (1892—), Polish politician, was the son of a Lublin peasant. In his youth, he joined Polish revolutionaries who worked for independence from Russia and participated in the underground anti-tsarist activities. After finishing school, he became a compositor in a printing shop, joined the Socialist and later the Communist party, and spent much time in Moscow prior to 1945. Because of his left wing philosophy, he was persona non grata with the Polish government formed after World War I.

During the German occupation of World War II, Bierut was active in the Polish underground movements. He became president of the National Council of Poland in 1943 and president of the newly-created soviet-sponsored Lublin provisional government on Dec. 31, 1944. He retained the presidency of the new Polish government of national unity that was formed in late June 1945. In his first press conference, on Oct. 10, 1945, he declared that Poland desired to be completely independent of all outside powers. He also asserted that the security of Poland depended on establishment of friendly relations with the soviet union, but emphasized that this would not mean Polish adoption of the larger country's economic or political systems. On May 27, 1946, he secured an arrangement under which the U.S.S.R. agreed to supply Poland with arms and munitions under long-term credits.

In an article that appeared in all Polish newspapers on Nov. 23, 1946, Bierut said that attacks on the government from Catholic pulpits formed "one of the greatest barriers to the good relations between the church and state." He also demanded that Polish Catholic priests "stop using their sermons for political purposes."

Biggers, John David

Biggers (1888—), U.S. industrialist, was born Dec. 19, 1888, in St. Louis, Mo. He was educated at Washington university (St. Louis) and at the University of Michigan, where he received his A.B. degree in 1909. He became president of the Libby-Owens-Ford Glass Co., in Toledo, O., in 1930. Biggers, who directed the U.S. census of unemployment (1937–38), was named, in June 1940, to become deputy commissioner under William S. Knudsen on the U.S. Council of National Defense, specializing in industrial production for armaments.

On Jan. 7, 1941, Biggers was appointed executive director of the production division of the newly created Office of Production Management. He left the OPM in August of that year to become U.S. minister to London. Shortly after his arrival, he devoted himself to problems of production in connection with lend-lease. He returned to the U.S. in Oct. 1941, and was granted a leave of absence by President Franklin D. Roosevelt to resume his post with the Libby-Owens-Ford Co.

Billiards

In the world of billiards, the most eventful year of the decade 1937–46 was 1938. It was a year which, among other achievements, saw Roger Conti, veteran French expert, dethrone Welker Cochran of San Francisco as the three-cushion champion of the world. The competition, held at Paris, resulted in a tie; in the play-off Conti won two out of three games from Cochran.

It was the year, also, in which Jimmy Caras of Wilmington, Del., Andrew Ponzi of Philadelphia, Pa., and Willie Mosconi of Philadelphia finished in a three-cornered deadlock for the pocket billiards crown and Caras emerged victorious from the play-off. A month later Caras retained the title by defeating Ponzi in a challenge match.

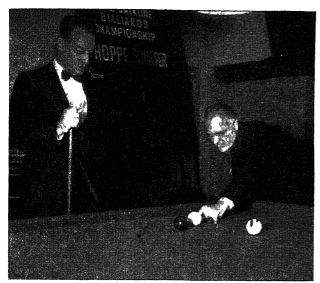

The same year saw young Jake Schaefer conquer Cochran for the 18.2 balk-line laurels. This pair dominated the balk-line field, and within thirty days Cochran regained the championship by turning back Schaefer in the challenge round.

Arthur Cranfield, Syracuse, N.Y., youngster, gained the national amateur diadem by beating Ted Murray of Burlington, Vt. Willie Hoppe, the biggest "name" in billiards, had no occasion to defend his three titles, the 18.1 and 71.2 balk-line championships and the cushion-carom honours.

But that was 1938. The year before, Hoppe kept the 18.1 laurels, achieving a new high-run record en route. Also in 1937, Ralph Greenleaf returned to activity after a four-year lay-off and proceeded to annex two tournaments in pocket billiards.

Hoppe and Schaefer introduced the 71.2 game, with Hoppe the victor. Schaefer, however, defeated Hoppe for the 28.2 crown. There were no three-cushion, 18.2 or cushion-carom tests.

The year 1939 brought a novel experiment in the form of an intercity series for the three-cushion championship. With ten cue artists, each representing an American city,

Willie Hoppe (right) and Jake Schaefer during the first 28.2 championship match in the U.S., Jan. 1937. Schaefer won the match

playing on a home-and-home basis, top honours finally went to Joe Chamaco of Sonora, Mex., who was playing for New York in this competition. With 55 victories and 17 defeats, Chamaco succeeded Conti, who did not defend.

In 1940, interest in three-cushion reached a new high, principally through the efforts of Hoppe. He shattered all standards as he romped to the most one-sided victory in history by capturing 20 games in a row in the grueling tests at Chicago, where 11 men vied for the three-cushion honours. Also in that year, Ponzi finished first with a 51-29 record in the six-man intercity struggle for the pocket billiards title.

Erwin Rudolph of Cleveland survived two play-offs and won the pockets championship in 1941, succeeding Mosconi. Hoppe retained the three-cushion crown that year. He remained on top the following year, but Rudolph lost the pockets title in a challenge match with Irving Crane of Livonia, N. Y. Before the year was up, however, Mosconi succeeded Crane.

In 1943 it was Hoppe who was best at three-cushions and Ponzi at pockets. The next year, Hoppe lost to Cochran and Mosconi regained the pockets championship. It was Mosconi and Cochran in 1945 and in 1946; Cochran, with no competition offered, kept the three-cushion title, while Crane annexed the pockets honours.

Throughout World War II, the stars of the billiard sport toured the U.S. service camps, playing exhibitions and entertaining the Allied fighters. Charley Peterson, trickshot expert, and Hoppe were the most prominent for their war work.

(L. Ef.)

Biochemistry

In the decade 1937–46, profound advances were made in classical biochemistry which includes the chemical nature and physiologic significance of proteins, carbohydrates, lipins, enzymes, hormones and vitamins; the processes of digestion, metabolism and nutrition; sources of energy in living systems; chemistry of blood and urine and their clinical significance; water balance, mineral and acid-base balance. More interest, however, was shown in the application of certain entirely new techniques and the development of several new points of view, which not only greatly enriched classical biochemistry and answered many of its difficult questions, but also led to entirely new fields of study, contributed significantly to the related fields of

genetics, pathology, pharmacology and immunology, as well as to clinical medicine, and thus greatly expanded and intensified knowledge of the mechanisms of living matter.

Among the new techniques may be mentioned the use of isotopes as tracers in the study of intermediary metabolism; microbiological methods (use of the growth of bacteria and neurospora in the quantitative estimation of vitamins, amino acids and other growth factors); the exploitation of electophoretic, ultracentrifugal and X-ray diffraction procedures in the characterization of proteins. Among the new points of view and fields of study were the demonstration that the infective agents of virus diseases are nonliving protein molecules; competitive inhibition in biological processes by structural analogues of biologically important substances; CO₂ fixation in animal tissues, formerly regarded as the prerogative of plants; lowand high-energy phosphate bonds and their role in the mobilization of metabolic energy; antibiotics, chemical inhibitors of bacterial growth like the sulfonamides and penicillin, their chemical nature and mode of action; cyclical processes in metabolism—that certain (probably most) metabolic reactions like the oxidation of pyruvic acid to CO₂ and water, the formation of lactic acid from glucose or glycogen, and the oxidation of most foods with the liberation of energy proceed by a progressive series of reactions, involving as many as ten or more interdependent

As in previous decades most of the facts of biochemistry were gathered by the classical methods of organic, analytical and physical chemistry. In the separation of pure compounds from complex mixtures, increasing use was made of selective adsorption and elution on the surface of inert solids, the so-called chromatography. In analytical and physicochemical studies, increasing use was made of optical methods, fluorimetry, and especially spectrophotometry in the identification and characterization of substances. X-ray diffraction studies were used not only for detection and identification of substances, but also for the measurement of interatomic distances, valence angles, the shape and size of molecules, especially proteins, and the stereochemical arrangement of groups especially in the steroids. By far the greatest amount of analytical data was, however, still gathered by rather conventional colorimetric, titrimetric and gasometric methods.

Proteins and Amino Acids.—Several new methods for the convenient and precise estimation of amino acids were developed; by use of these, knowledge of the amino acid composition of a number of pure proteins as well as of tissues, excreta and foods was greatly extended. At least three complex proteins, casein, insulin and edestin, had more than 95% of their nitrogen accounted for; and in the case of β -lacto-globulin the data were reported to be more than 99% complete, so that an empirical formula was written for a molecule of weight 42,000, containing 370 total amino acids of 20 different kinds. The amino acid data were in fair agreement with the physicochemical properties of the protein, molecular weight and acid-base combining capacity.

The reaction of amino acids with ninhydrin to form CO₂ and NH₃ was adapted by Donald Dexter Van Slyke and his associates for the quantitative estimation of total free amino acid, and increased the precision and significance of the estimation of total free amino acids in such mixtures as blood and protein hydrolysates. The reaction is not given by peptides or proteins. A single complication was that aspartic acid forms two moles of CO₂; all other

amino acids yield 1 mole of CO_2 quantitatively. For the estimation of individual amino acids, microbiological methods were increasingly used because of their convenience and reliability. By the end of the decade, 16 amino acids could be determined in this way. The use of periodic acid, which converts β -hydroxy- α -amino acids into NH₃ and aldehydes, furnished precise data for threonine, serine and hydroxy-lysine. Probably the most precise amino acid data (less than 1% error) would be obtained by the isotope dilution method, and by the use of specific decarboxylases. The former was very cumbersome, and involved the preliminary preparation of amino acids with an excess of N¹⁵. The specific decarboxylases were obtained from certain bacteria, and the method was successfully applied to five amino acids.

The groups responsible for the acid-base combining capacity of proteins and their corresponding pK' values were shown to be α -carboxyl, 3.0 to 3.2; other carboxyl, 3.0 to 47; imidazol, 5.6 to 7.0; α -amino, 7.6 to 8.4; sulfhydryl, 9.1 to 10.8; ϵ -amino (lysine), 9.4 to 10.6; phenolic hydroxyl, 9.8 to 10.4; guanidine (arginine), 11.6 to 12.6. Several proteins, for example haemoglobin and β -lactoglobulin, had their observed acid base titration curves satisfactorily interpreted in terms of the analytically determined values for these groups. In terms of the heat and of ionization of these groups, the effect of temperature on the titration curves was successfully predicted. In terms of the ionic charge on the molecule and the molecular weight, the electrophoretic mobility at any pH could be calculated, and in the case of the globular lactoglobulin, good agreement with the experimental values was found.

Criteria for the purity of crystalline proteins were critically examined. The property of constant solubility in the presence of increasing amounts of the solid protein was found to be most important, while electrophoretic velocities at various pH's and sedimentation in the ultracentrifuge were valuable adjuncts. Several crystalline proteins were shown to be mixtures. Among the proteins showing constant solubility, and therefore considered pure, were chymotrypsinagen, trypsin, pepsin, ribonuclease and several pituitary hormones.

The classical studies by Max Bergmann and associates on the hydrolysis of synthetic peptides by crystalline proteolytic enzymes, specifically characterized each of several enzymes in terms of the nature and position of the amino acids at the split peptide bonds. Thus the splitting of peptides by pepsin was found to occur only where tyrosine or phenyl-alanine are bound through their amino groups; chymotrypsin requires a peptide bond where tyrosine or phenyl alanine are bound through their carboxyl groups; while the action of trypsin is limited to linkages where lysine or argine are bound through their carboxyl groups. Other properties of the peptide, like the presence of extra acid or basic groups, may decrease but not extend the application of these rules. Thus the presence of a free amino group on the amino acid bound to tyrosine, interferes with the action of pepsin. For example, carbobenzoxy-glutanyl-tyrosine is split by pepsin, but glutamyltyrosine, with its free amino group in the glutamic acid, is not. If the basic group is located at a greater distance from the glutamyl-tyrosine peptide bond, pepsin is still capable of causing hydrolysis. In a similar manner the presence of a free carboxyl group on the amino acid adjacent to the tyrosyl linkage, interferes with the action of chymotrypsin. This specific characterization of these crystalline enzymes gave promise of value in studies on the

arrangement of amino acids in peptides and proteins.

Virus Proteins.—The observation by Wendell M. Stanley in 1935 that the infective agent of tobacco-mosaic virus could be identified with a crystalline protein led to much further work on the chemical nature of this and other virus proteins. In the case of several animal virus diseases, certain proteins separated from the infected animal tissues were shown to be the infective agents. Among these were vaccinia, chicken sarcoma, equine encephalomyelitis, rabbit papilloma, and later influenza and poliomyelitis. These nonliving infective molecules are reproduced only in the tissues of certain multicellular organisms, which favour the development of the infection. When the host is the free living individual bacterial cells, the infective protein is called bacteriophage.

All virus proteins were shown to be nucleoproteins, containing from 5% to 40% nucleic acid. They are all very large molecules, the plant viruses ranging in molecular weight from 5,000,000 to 60,000,000, and the animal viruses still larger. Only the ribose type of nucleic acid is found in the plant viruses, while certain animal viruses contain ribose (chicken sarcoma, equine encephalomyelitis) and others contain the desoxy-ribose types (rabbit papılloma, influenza). The animal virus proteins are more complex than the plant, and in addition to nucleic acid and protein contain lipoid, and at times flavin, copper and other components. Most of the crystalline plant virus proteins were characterized in terms of their amino acid composition.

As in the case of crystalline enzymes, the biologic activity (infectivity) of crystalline virus proteins was shown to be related to the presence of certain organic groups in the molecules. In some cases modification of these groups, like the acetylation of amino or phenolic hydroxyl groups, or the oxidation of —SH groups, or even the exposure of the protein to radiations, resulted in modified proteins, which, while still infective, were markedly attenuated. The chemical and physical attenuation of these infective agents were more convenient and better controlled than the classic biologic methods developed by Edward Jenner and Louis Pasteur of passing the infection through foreign hosts, and offered hope for the practical control of virus diseases.

Starch and Glycogen.—The chemical nature of these polysaccharides was elucidated by observations on the disaccharides formed by partial hydrolysis, by the nature of the methylated monosaccharides formed, by hydrolysis of the methylated polysaccharides, and by studies on the molecular weights of the polysaccharides. The conversion of starch and glycogen into maltose in large yield (about 50%) by action of amylases, and the formation of a large yield of 2,3,6-trimethyl glucose by methylation and hydrolysis, showed that these polysaccharides are composed primarily of anhydro-glucose units in which the aldehyde group of one glucose is linked to carbon 5 of the next. The yield of tetramethyl-glucose indicates the fraction of terminal glucose units; in the case of starch the formation of about 5% tetramethyl-glucose shows one out of 30 glucose units to be at the end of a chain, while with glycogen, about 10% tetramethyl-glucose, shows one-eleventh of the glucose units to be terminal.

In 1940, it was established that most natural starches contain two components, 10% to 30% amylose and 70% to 90% amylopectin. Amylose is completely converted to maltose by the enzyme β -amylase and after methylation and hydrolysis yields about 0.3% tetramethyl-glucose. This shows that only one in 300 or 400 glucose units is terminal. Amylopectin yields only 54% maltose, and after methylation and hydrolysis forms about 4.7% tetramethyl-glucose,

showing that one twenty-fifth of the glucose units are terminal. By osmotic pressure measurements, amylose has a molecular weight of 10,000 to 60,000, while the molecular weight of amylopectin is more variable and usually larger, 50,000 to 1,000,000. From this it was concluded that amylose molecules are single long straight chains of about 300 to 400 glucose units, while amylopectin consists of a large number of branched chains, each composed of about 25 glucose units, to form a ramified structure. The linkages between the glucose units in any one chain of the amylopectin molecule are 1-5 (that is, from the aldehyde group of one glucose unit to the secondary alcohol of carbon 5); but the linkage between the chains is from the terminal aldehyde of the chain to the primary alcohol carbon 6 of one of the glucose units in the next chain, the so called 1-6 linkage. Glycogen was found to yield only 47% maltose, when hydrolyzed by amylase and, after methylation and hydrolysis, to yield only 9% tetramethyl glucose. This indicated that one-eleventh of the glucose units are terminal. Glycogen is thus even more highly branched than amylopectin.

The blue colour which starch forms with iodine was shown to be determined by the number of glucose units in the free ends of the unbranched portion; that is, the number of glucose units between the terminal glucose unit with carbon 4 unsubstituted and the point where branching occurs, where carbon 6 is substituted in addition to carbon 4. In amylose, where there is no branching at all, this number is greatest, and the iodine colour is most deeply blue. With amylopectin, where the ends of the branches have a length of about 25 glucose units, the intensity of blue colour is only about one-sixth that of amylose, and the shade is more purple. The erythrodextrins, which give a red colour with iodine, have lengths of branches of about 10 glucose units. Glycogen, with the shortest end branches of only about five to eight glucose units, gives a brown colour with iodine.

Enzymatic Synthesis and Disaccharides and Polysaccharides.—The first synthesis of starch and glycogen was observed in 1939, when it was found that the phosphorylases, a widely distributed group of animal and plant enzymes which in 1935 had been shown by Carl F. Cori to convert glycogen and starch into glucose-6-phosphate, could also reverse this reaction. Either action requires the association of adenylic acid with the enzyme protein. The synthetic action requires also the presence of an activating polysaccharide, and the action is, therefore, not a condensation of glucose-6-phosphate units with each other, but rather their addition to a pre-existing polysaccharide chain. Comparative studies on the phosphorylases of different tissues showed many striking differences. The purified potato enzyme and the crystalline muscle phosphorylase form polysaccharides which are long straight chains of glucose units, give an intense blue colour with iodine, and thus resemble amylose; while the polysaccharides from the less pure enzymes of brain, heart and liver, are branched chains, giving a brown colour with iodine, and resemble amylopectin and glycogen. Later a branching factor was separated from both animal and plant tissues, the addition of which to the crystalline muscle enzyme, caused the synthesis of a glycogenlike branched polysaccharide. The potato phosphorylase can be activated by the straight chain amylose or more effectively by dextrins, and the maximum polysaccharide synthesis per unit weight of activating dextrin occurs when the chain length of the latter is five glucose units. The muscle enzyme requires as activator glycogen or amylopectin, that is, larger molecules with branches.

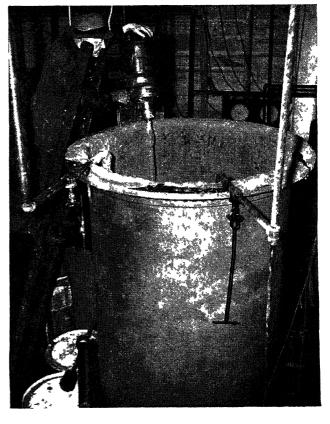

The first synthesis of sucrose was accomplished in 1943

by Michael Doudoroff with the aid of a bacterial phosphorylase from *Pseudomonas saccharophila*, which catalyses the reversible reaction glucose-1-phosphate+fructose=sucrose+inorganic phosphate. For this reaction, no added coenzyme seems to be necessary, and the synthesis does not require the addition of disaccharide. Disaccharides of glucose with sorbose, and of glucose with keto-xylose can be synthesized with the same enzyme. This work furnished convincing evidence that the furanose form of fructose exists in equilibrium with the predominating pyranose structure.

Vitamins.—During the decade, the synthesis of six vitamins was accomplished: vitamin A and vitamin E in 1937; pyridoxin in 1939; pantothenic acid and vitamin K in 1940; biotin in 1942. Although the chemical nature and structure of niacin was known in 1873, and it was incorrectly thought to be the antineuritic factor in 1912 to 1914, it was not until 1937 that it was recognized as the antiblacktongue factor for dogs, and the pellagra preventive factor for humans.

Great progress was made in the convenient and accurate estimation of vitamins in natural products by chemical, physical and microbiological methods. Except for vitamin D, these methods displaced entirely the animal assays involving use of rats, guinea pigs or chicks for practical vitamin analysis. Microbiological methods, first introduced for riboflavin by Esmond E. Snell and Frank M. Strong in 1939, were soon extended also to niacin, pantothenic acid, para-amino-benzoic acid and biotin. Ascorbic acid and vitamin A are best measured colorimetrically or spectro-

Vitamin A, extracted from livers of fish caught off Norway and Spain before World War II, was found to exist in its highest concentrate in shark-liver oil and was produced in large quantities in the U.S. beginning in 1942. The picture shows an agitator tank in which the crushed livers are mixed with water and chemicals, then heated and agitated to form a strong emulsion

photometrically. Thiamin is most commonly measured fluorometrically after oxidation to the fluorescent thiochrome.

A large body of data was obtained and much tabular information became available on the occurrence of vitamins in foods, and the effects of cooking, storage and processing. More difficult was the formulation of vitamin requirements of animals and man. The quantity of vitamin needed to prevent symptoms of a particular deficiency disease is not necessarily the optimum or even a desirable amount for good health. Aside from age and sex, vitamin requirements were shown to vary with the nature of the environment and of the nonvitamin constituents of the diet. Thus the requirement for thiamin is doubled, and that for choline is increased seven times by exposure to a hot moist (tropical) atmosphere. Also the thiamin requirement is much greater on a high carbohydrate diet than on a diet containing much fat and little carbohydrate. Despite these difficulties, the Committee on Foods and Nutrition of the National Research council of the United States in 1941 published a table of "Recommended Daily Allowances for Specific Nutrients." For the average 70 kg. man, this specified 3,000 calories, 70 g. protein, 0.8 g. calcium, 12 mg. iron, 5,000 units Vitamin A, 1.8 mg. thiamin, 75 mg. ascorbic acid, 2.7 mg. riboflavin, 18 mg. niacin; correspondingly small amounts are given for women and children, and larger amounts during pregnancy and lactation. This table was intended as a yardstick for good nutrition and was of great value in nutritional surveys.

The marked inadequacies in the average U.S. dietary which these surveys revealed, led in 1943 to legislation requiring the enrichment of flour so that each pound contained at least 2.0 mg. thiamin, 1.2 mg. riboflavin, 16 mg. of niacin, and 13 mg. of iron. For enriched bread, the minima were placed at 1.1 mg. thiamin, 0.7 mg. riboflavin, 10 mg. niacin and 8 mg. iron per pound. The bureau of agricultural economics of the U.S. department of agriculture showed that in 1944 for the first time the food which disappeared in the civilian consumption was equal to the N.R.C. recommended dietary allowances. These estimates involved conservative deductions for waste and deterioration of ingredients in storage, transportation, cooking and serving. In 1943 the values for riboflavin and niacin were deficient. In spite of this adequate supply, nutritional surveys among low income and industrial groups in the U.S. and Canada showed many dietaries far below the recommended allowances. Many of these cases were the result of poor food habits, ignorance or indifference, as well as unavailability of foods or inadequate income. Aside from the relatively few cases of acute and severe nutritional deficiency disease, there was considerable difference of opinion concerning the prevalence of deficiency states. The Food and Nutrition board of the N.R.C. reported that among the population of the U.S. mild deficiency states were common; because of their mildness and gradual development, they usually remained unsuspected. Many nutrition experts, on the other hand, felt that the prevalence of malnutrition was exaggerated, that the criteria for judging deficiency states were too sensitive, and that the recommended dietary allowances were too high. The evidence was very conflicting. Many cases of marked improvement of efficiency, decreased absenteeism, and improved well being were reported as a result of vitamin therapy. On the other hand, other surveys on native populations in special areas in widely different parts of the country showed that good health and

vigour were being maintained on diets containing far less than the recommended allowances. All studies seemed to agree that there was no value in supplementing normal rations of common foods with vitamins in excess of the recommended allowances. (See also Dietetics; Food Research.)

Vitamins as Coenzymes.—In the interpretation of the mechanisms by which vitamins exert their profound biological effects, their role as prosthetic groups of enzymes is most striking. Riboflavin was the first vitamin which was shown to be a coenzyme, when in 1933 the prosthetic group of the yellow enzyme (discovered by Otto Warburg and W. Christian in 1932) was recognized to be the same as lactoflavin, which in turn had vitamin B2 properties. The coenzyme nature of the vitamin was confirmed after the synthesis of riboflavin in 1935, by the demonstration in 1936 that the synthetic riboflavin-phosphate is identical with the coenzyme. In 1938, with the discovery of flavineadenine dinucleotide as the prosthetic group of d-amino acid oxidase, another coenzyme effect of a riboflavin compound was demonstrated. Later, cytochrome reductase was shown to contain riboflavin phosphate (mononucleotide), and at least seven other enzymes containing flavin-adeninedinucleotide were demonstrated. Among these were xanthine oxidase, glucose oxidase of yeast, diamine oxidase of kidney, diaphorase and glycine oxidase. These are all oxidizing enzymes, and it is the flavin part of the molecule which is reversibly oxidized and reduced.

In 1937, diphosphothiamin was shown to be identical with cocarboxylase, the prosthetic group of the enzyme which causes decarboxylation of pyruvic acid. Later, diphosphothiamin was shown to be necessary for a number of other enzymatic reactions of pyruvic acid, dismutation with the formation of lactic and acetic acids; oxidation, with the formation of acetic acid and CO₂; condensation with oxaloacetate to form cis-aconitate (citric acid cycle); and condensation with CO₂ to form oxaloacetate (CO₂ fixation). Since pyruvic acid is the pivotal intermediate of carbohydrate metabolism, the importance of thiamin for carbohydrate metabolism follows logically. The accumulation of pyruvate and lactate in the blood and tissues of B₁ deficient animals and the prompt decrease in their concentration following the administration of thiamin first demonstrated clearly the importance of thiamin for pyruvate metabolism.

The discovery of the pellagra-preventive character of niacin, in 1937, included this vitamin at once among those which determine enzyme activity, since nicotinamide two years earlier had been demonstrated to be a constituent of cozymase I and cozymase II. Cozymase I, later called diphosphopyridine nucleotide or DPN, was first known as a coenzyme for alcoholic fermentation; cozymase II, triphosphopyridine nucleotide or TPN, was shown by Warburg and Christian in 1933 to be necessary for the oxidation of glucose-6-phosphate by an enzyme in red blood cells. After 1937, these nicotinic-acid-containing nucleotides were shown to be involved in the enzymatic oxidation of numerous metabolites: glycerophosphate, alcohol, lactate, glutamate, malate, β -hydroxybutyrate; and there were doubtless many others. They thus play a fundamental role in intermediary metabolism.

A fourth vitamin, pyridoxine or B_6 , was shown to be a part of two kinds of enzyme systems, amino acid decarboxylases and transaminase. Here again it is not the originally described vitamin, but the phosphoric ester, in this case, of a derivative of the original vitamin, pyridoxal phosphate, which is the effective agent. Three substances show equal vitamin B_6 activity for growth of rats and

yeast: pyridoxine, pyridoxamine and pyridoxal, but only the last two play a role in animal metabolism. Pyridoxamine and pyridoxal constitute a considerable part (in active tissues like liver and yeast the greater part) of the vitamin B_6 content. Apparently animal tissues have the capacity of converting pyridoxin into pyridoxal and pyridoxamine.

In 1944 pyridoxal phosphate was shown to be a coenzyme for the decarboxylation of several amino acids by bacterial decarboxylases, and in 1945 a chemical function for pyridoxal phosphate was found in animal metabolism, that of a coenzyme for transaminases. This function was suggested by the observation that tissues of B₆-deficient rats have low transaminase activity and that pyridoxal and pyridoxamine are interconvertible by heating with amino and keto acids respectively. Proof of this function was furnished by preparation of the transaminase apoenzyme and the observation of its activation by synthetic pyridoxal phosphate. This gives the B₆ group of vitamins a fundamental role in protein metabolism. (See also Chemistry; Endocrinology; Genetics; Physiology; Psychology; Vitamins.)

Biological Warfare

Biological warfare may be defined as the use of bacteria, fungi, viruses, rickettsies and the toxic products of living organisms (as distinguished from synthetic chemical agents or poisons) to produce disease or death in men, animals or plants.

Through the end of the decade 1937-46 this means of waging war had never been used by any nation on a scale larger than isolated sabotage activities. During the years between World Wars I and II technical advances in bacteriology and allied fields stimulated the interests of both scientists and military personnel in the feasibility and possibility of biological warfare.

There was no unanimity of opinion that this form of warfare was technically possible. However, enough scientific evidence was accumulated to convince those responsible for planning the defense of the various United Nations that appropriate steps should be taken to prepare for adequate defense.

At the onset of World War II, agencies were set up in the English-speaking countries to carry on research and development and to advise policy-forming groups of the scientific advances in the pertinent fields of micro-biology. Prominent scientists of the United Kingdom, Canada and the United States were formed into a committee to exchange technical information on the subject. It was concluded that biological agents could be used as a means of waging war. Both military and civilian units were organized to carry out research projects which would enable the several nations to provide defensive measures against a possible biological warlare attack. It was assumed that an aggressor nation would not hesitate to use biological methods should such use seem advantageous to a nation at war.

All agents and their toxic products known to be pathogenic for men, animals or plants were subjected to comprehensive consideration and screening to ascertain those which could possibly be used by an enemy.

Specific agents deemed to be potentially useful to an enemy were selected for exhaustive study and investigation. They were cultivated in appropriate culture media under optimum growth conditions to develop strains of highest possible virulence. Their pathological effects on experimental animals and plants were studied. Methods of mass production were improved, as were means for storage and processing to maintain virulence. Animals and plants were infected with the various organisms so that methods of prevention, protection, diagnosis and treatment could be perfected. This led to a number of highly important advances in medical knowledge. Much light was thrown on the use of antibiotics such as penicillin and streptomycin. Knowledge of the use of sulfa drugs and other chemotherapeutic agents was advanced. Numerous research studies added to the basic information on principles of infection, immunity and epidemiology. Much was contributed to the general field of use and appreciation of antiseptics and germ-destroying chemicals and agents.

Comprehensive studies were conducted in the field of plant pathogens and growth-stimulating chemicals. Valuable information was gained in regard to infectious diseases of farm crops. Methods of control of various forms of leaf and stem blight, root rot, rusts and smuts were investigated. Chemicals acting as growth-stimulants and plant hormones were synthesized, and their effects were investigated.

Out of these war-stimulated researches evolved a mass of knowledge of much value to agriculture. Especially important to agricultural economics was the information gained on control of weed pests by use of chemical sprays.

The primary objective of the work of the United Nations was the development of defensive measures for use in the event of employment of biological warfare by an enemy. In this connection it was essential to consider critically many offensive agents in order to gain accurate information as to defensive procedures to be taken to protect against them.

Elaborate facilities were developed for obtaining and evaluating information about axis intentions. Reports indicated that some of the axis powers—Germany, Italy and Japan—had been carrying out research in biological warfare since before 1936. As information of such activities accumulated, it became increasingly evident that due consideration should be given to ways and means for use of this type of warfare against such nations as might attack one of the United Nations with biological agents.

The decade 1937-46—particularly the years 1940-46—witnessed an example of a co-operative enterprise in scientific research and development of a scope rarely, if ever, attempted before.

The military, naval, nonmilitary governmental agencies and civilian scientific groups of the United Kingdom, Canada and the United States, collaborated in various phases of basic research, developmental projects, production of matériel and testing projects. There was no single phase of the over-all problem of study of biological warfare in which this co-operative action was not evident. Certain materials designed by British scientists were produced in pilot plants in the United States and tested in Canada. An outstanding example of a jointly developed material was Rinderpest (serious infectious disease of cattle) vaccine. Since Rinderpest had never been present in North America, cattle on that continent would be highly susceptible. Should the disease have been introduced by an enemy, or accidentally, an important source of meat and dairy products would have been jeopardized seriously. A joint Canadian-United States commission was organized to study the disease and to prepare a vaccine to be used as a preventative. The efforts of the commission, composed of military and civilian scientists, met with marked success. An effective vaccine was developed and produced. It was tested in co-operation with British scientists in an area in Africa where the disease was prevalent. The actual field tests proved the vaccine to be markedly efficient. When the need for its use in North America as a war measure had passed, large quantities were made available to U.N.R.R.A. for use in China.

Even though extensive studies in biological warfare were carried out by the various United Nations and the axis powers, this type of warfare was not used by any of the belligerent nations in a primary military operation during World War II. Certainly some of the axis nations were engaged in active research to develop the potentialities of this means of warfare even before the decade 1937-46. Why they did not resort to active military use of biological agents remained a matter of conjecture. It would seem a safe assumption that their decision to avoid its use was based on strategic and tactical factors rather than upon a sense of moral values. Perhaps when the strategic situation might have been advantageous to the axis powers they foresaw that the air superiority of the United Nations was imminent, and so decided against this type of warfare on tactical grounds. They might have based their decisions not to use either biological or chemical agents as a final gesture upon fear of the added antipathy of the United Nations such a step would stimulate. Or again they may have been deterred by a fear of retaliation. As for the accounting for the fact that none of the United Nations used either chemical or biological agents, it was generally assumed that the policy-formers agreed among themselves not to engage in such tactics except as a retaliatory measure. Be that as it may, the value of large-scale use of biological warfare had neither been established nor disproved by actual military experience. Research and experiment led merely to the conclusion that it had advantages as a weapon.

The United Nations gained military information leading to means of adequate defense against a potential danger. Over and above this result, findings of lasting importance to the economy of the nations were forthcoming. Co-operative research was carried out on a scale never before attempted in the several fields of biology. Restrictions of military security prohibited statements concerning the specific biological agents studied, but technical information of a nonmilitary bearing, of value to medicine, agriculture, industry, the arts and basic sciences was made

available to the public. Scientific papers were published in the various technical, scientific and industrial journals to enable interested individuals and groups to make use of the various research studies.

Some of these contributions by the United Nations' biological research were as follows: studies of mechanism and development of immunity in humans and animals; advances in treatment of several infectious diseases; increased knowledge of use, and effect of antibiotics (pencillin and streptomycin) and sulfa drugs; development of methods of production and use of certain toxoids and vaccines; production and isolation of pure bacterial toxins and their use in preparation of toxoids; development and study of methods for rapid detection of minute quantities of disease-producing agents; improvement of methods for mass production of micro-organisms and their products; information as to production and control of plant diseases; study of the effects of 1,000 or more chemical agents on growing plants; development of protective devices, and techniques for safe handling of pathogenic micro-organisms and their toxic products. Birmingham

City, county and parliamentary borough, England, in the north-west of Warwickshire, Birmingham is a great industrial centre. Pop. (1938 est., 1,041,000); (1945 est.) 1,001,600. The year 1937 saw in Birmingham the climax of a great rebuilding effort which had begun in 1919, achieving 80,000 modern houses and the elimination of acres of slums. Compared with the rest of England, unemployment had been slight and industry was healthy. In 1938 the city celebrated the centenary of its charter with brilliant pageantry. In that year preparations against possible air attack slowed up rebuilding; atomic energy research at the university had already reached an advanced stage. Yet a great new hospital and medical school was opened, and in 1939 the city's Elmdon airport came into use. On the outbreak of World War II in Sept. 1939, all civil building ceased, except on part of the new civic centre and on the new King Edward VI school. Women and children were evacuated in anticipation of bombing raids, which began in Aug. 1940 and were almost incessant by night until April 1941. In these 2,241 people were killed; 6,692 injured; 160,000 houses and other buildings were destroyed or damaged. Birmingham gave its quota of men and women to the forces; those left in the factories of Birmingham and district achieved one-quarter of the nation's war production. During the war the future rebuilding of the centre and much of the suburbs of Birmingham was planned. Parliament approved in 1946 a £15,000,000 scheme for a new inner ring road requiring reconstruction of much of central Birmingham. Duddeston and Nechells, a slum area, was to be razed and rebuilt with homes and factories segregated, at a cost of £8,000,000. Other areas were to be similarly treated later. For 1947-56 100,000 new houses were planned. The world-famous jewellery quarter was to be rehoused in new "flatted" fac-

tories. Utility services, including water which was piped $73\frac{1}{2}$ mi. from Wales, were to be improved at a cost of £11,000,000, and social services were to be kept abreast of modern conditions. (A. S. Gs.)

Birth Control

At the beginning of the decade 1937-46, a colourful chapter in the history of birth control had reached its climax and another was beginning. In 1936, in a farreaching decision, the federal courts had lifted a ban which for 63 years had prevented physicians from freely exchanging information and materials for the control of human fertility. The decade following this decision was to mark attainment of maturity for the birth-control movement, following its early history of perennial court battles, clinic raids and public controversy.

The term "planned parenthood" came into being as the description of a program which included not only birth control but also aid to childless couples and education for marriage. The use of birth control for healthful spacing of births won inclusion in maternal-care programs of seven states.

Following clarification of the legal status of birth control in 1936, the inclusion of fertility control in public-health programs throughout the country became a major objective of the birth-control movement. For the better accomplishment of this purpose, two organizations, the American Birth Control league and the Birth Control Clinical Research bureau, were merged into one organization in 1938. One result of this merger was to eliminate duplication of effort and to permit presentation to the public of a comprehensive and practical program of education and action under the leadership of one strong national organizationthe Birth Control Federation of America. A few years after the merger, in order to emphasize the positive character of the organization, the name of the national organization was changed to the Planned Parenthood Federation of America, Inc.

The Planned Parenthood federation became the national agency and clearing house for the 35 state leagues and more than 200 local committees which were affiliated with the national organization in 1946. The local committees carried the burden of operating privately supported clinics for parents unable to afford the services of private physicians. Between 1938, the time of the merger, and 1946, the number of planned parenthood centres (including private, public health and hospital clinics) had grown from 489 to nearly 600.

While the clinics still performed a necessary and expanding service, parents in 1946 found it possible also to obtain advice and help in planning their families through the services of physicians in private practice.

Public opinion polls during the decade demonstrated the development in public acceptance of birth control as a health and social measure. In 1938 the Ladies Home Journal found in a survey that 79% of U.S. women favoured birth control. A Fortune magazine poll in 1938 estimated that sales of contraceptives then totalled close to \$250,000,000. A nation-wide Gallup poll in 1940 among both men and women revealed that 27% of those questioned favoured furnishing birth-control information through government health centres. In 1943, 84.9% of women, answering a second Fortune poll, declared themselves in favour of making knowledge of birth control available to all married women.

Even in Massachusetts and Connecticut, the only two states still forbidding physicians from giving birth-control information for any cause whatever, opinion polls showed the views of the public in sharp contradiction.

A significant milestone was passed in 1937, when the American Medical association adopted a report of its "Committee to Study Contraceptive Practices and Allied Problems," thus accepting birth-control as an integral part of medical practice. From then on, advance along the road to medical recognition came quickly. The following year, 332 physicians of the National Medical council, including the president, presented a signed document at a conference held by the children's bureau in Washington, D.C., asking that contraceptive information be included in all obstetrical, maternal and post-natal clinics as a means of reducing infant and maternal mortality.

Shortly thereafter, the Journal of the American Medical Association for the first time published a series of articles giving approved standards of contraceptive techniques and a list of reliable products. Similarly, the first scientific treatment of the subject of conception and birth control appeared in the Cyclopedia of Medicine and Surgery.

Discussion of various phases of conception control appeared in medical journals with increasing frequency. A study made by the Medical Committee of the Planned Parenthood federation showed that of the 3,381 physicians, obstetricians and gynaecologists answering a questionnaire, 96% declared their approval of conception control when medically indicated; that 88% approved of it for spacing births; and 77% believed it should be furnished to any married woman on request.

With the rapid growth of medical acceptance of birth control as a health measure, and the growing interest of the public in family planning, steps were taken to provide educational facilities for doctors in the techniques of conception control. Exhibits, films and technical manuals were supplied for medical meetings. Textbooks and pamphlets had nation-wide circulation among physicians and medical students. The Techniques of Conception Control, first published in 1933, went through a half-dozen editions.

Testimony as to the advantage of spacing children was the study of 7,000,000 births and stillbirths made by Dr. Jacob Yerushalmy. This study indicated that mothers could lower the chance of stillbirth if their babies were born neither too close nor too far apart. His findings supported the long-standing contention of medical authorities that child-spacing is a maternal health measure.

Legal Acceptance.—Legal obstruction was all but swept away during the decade. The U.S. circuit court in 1936 decided that contraceptives imported for legal purposes did not come within the restrictions of the federal statutes as these were articles employed by physicians "for the purpose of saving life or promoting the well-being of their patients." Similar decisions thereafter were won in the Canadian courts. In Puerto Rico, the U.S. district judge ruled in favour of a defendant, declaring that "contraceptive articles may have a lawful use."

The U.S. treasury declared the American Birth Control league a philanthropy and therefore tax free, with gifts and bequests deductible from tax returns. Furthermore, co-operation with the Federal Trade commission resulted in halting advertisements of fraudulent and dangerous drugs.

By a decision of the U.S. court of appeals, the Consumers' union won the right to recommend approved contraceptives to married women. A similar decision was won after the pamphlet, "Preparing for Marriage," by Paul Popenoe had been barred from the mails. Neither case,

said the court, came under the Comstock obscenity law as charged by the post office authorities.

There were, however, two adverse decisions in state courts. In Massachusetts the supreme court ruled that the state's proscriptive law on birth control was constitutional and with no exceptions for physicians. In 1944, a referendum to repeal the law lost by a close vote. In Connecticut, the state supreme court of errors likewise upheld a statute making it illegal for physicians to prescribe contraceptives or for individuals to use them. This ruling was appealed to the U.S. supreme court which, on the basis of a technicality, declined to review the decision of the lower courts.

Religious Attitudes.—During the late 1930s many of the leading Protestant and Jewish denominations took positive positions favourable to birth control. In 1944, a National Clergymen's Advisory council of more than 1,000 leaders was organized, and Planned Parenthood leagues in 15 states formed state advisory councils to co-operate with the national organization.

The most consistent opposition to birth-control methods continued to come from the Roman Catholic church. However, in 1937, the church gave its approbation to *The Rhythm*, a widely distributed book by Dr. Leo J. Latz, offering a "natural" method of birth control.

Minority Groups.—During the 1937–46 decade, the greatest need for birth-control information appeared to come from the less privileged minority groups. This was particularly true of the Negro population, inasmuch as twice as many Negro mothers as white were dying in child-birth; the same was true of Negro babies. In 1939, a dual program of birth-control service and education was initiated; demonstration areas in the south were established, and a National Negro Advisory council was organized. Effort was made to reach even the most limited in opportunity.

In 1944, a biracial committee on work with Negroes was appointed, a full-time Negro worker was added to the National Planned Parenthood staff and later a full-time field consultant. Conferences, meetings and institutes were part of an extensive educational program. Strong support came from the National Medical association, the National Council of Negro Women, the Negro Newspaper association, Jeanes teachers, public health educators, the Y.M.C.A. and Y.W.C.A. staffs, the National Urban league and the National Congress of Colored Parents and Teachers. In 24 Negro colleges and professional schools, interpretative programs were given; clinics in congested Negro districts were opened and Negro doctors were added to the list of Planned Parenthood referral physicians.

The condition of the migrant labourer, particularly in the years before World War II and during the depression, brought poignantly to the attention of the U.S. people the plight of the migrant workers. With the co-operation of official agencies and camp public health nurses, birth-control service was brought to many migrant camps and remote rural communities. In one year, 1938, more than 20,000 women were reached through this special effort.

Infertility Programs.—During the decade, planned parenthood organizations accepted aid to childless couples as a basic element of their program. Inasmuch as one married couple out of ten was involuntarily sterile, the demand for medical fertility specialists in this field increased yearly. More than 23,000 copies of the Planned Parenthood federation's pamphlet, "To Those Denied a Child," were circulated in the first year following publication.

Unfortunately, extension of both infertility research and services were severely hampered during the war years. In 1946, there were only 47 established clinics where childless couples could obtain treatment. The number of private specialists was also limited. Most of the existing infertility services were located in medical schools and hospitals, and a few in regular planned parenthood centres. Indicative of planned parenthood interest, was a grant of \$2,500 by the Connecticut league in 1946 for infertility research at Yale university, New Haven, Conn.

Clinic Services.—One ultimate goal of the planned parenthood movement was reached during the decade 1937–46 in seven states. In 1937, North Carolina became the first state to make child spacing an integral part of its program for maternal care. South Carolina followed in 1938. Five other states later included planned parenthood in their state health programs: Alabama, Florida, Texas, Mississippi and Virginia.

In 1941 the transition from the private clinic to state or county departments of health was facilitated by the U.S public health service when it declared that should a state department of health decide on its own initiative to under take a child-spacing program, the federal public health service would give the program, and would give the proposal the same consideration given to any other state health measure. Still another important ruling was issued by the commissioner of health of New York city in 1944 whereby "upon request directional information may be given to any person asking for the location of a child-spacing service."

Throughout the decade 568 Planned Parenthood clinics continued to serve thousands of patients in hospitals, public health centres and in their extramural services. World War II interfered severely with clinical service, owing to shortages of professional personnel and the difficulty in getting medical equipment, yet the clinics carried on. *

The referral service of the Planned Parenthood federation listed approximately 3,000 physicians to whom enquiries could be directed. In addition to these enquiries were other thousands of enquiries from physicians, social workers, nurses, educators, ministers, professional workers desiring technical or specialized information.

An ever broadening stream of technical literature poured steadily to state and local groups. In the later years of the decade, the literature was directed mainly toward specialized groups rather than to the public or the profession at large. (See also BIRTH STATISTICS.) (M. SR.)

Birth Statistics

Systematic records of births are kept principally by the English-speaking countries and the countries of western Europe. In order to facilitate comparisons of birth statistics, it is customary to divide the annual births of a country by its population for the same year; the result, usually expressed in terms of births per 1,000 of population, is known as the birth rate. Thus, in 1944 there were recorded 2,794,800 births in the United States with a mid-year population (including the armed forces overseas), estimated at 138,083,000, the birth rate was 20.2 per 1,000 of population.

International Comparisons and the Effect of War.—Table I contains a comparison of birth rates for the period from 1937 to 1944, for a number of countries, as far as the data were available. Generally speaking, the birth rates for the English-speaking countries and the countries of western Europe were at a relatively low level throughout this period as compared with the high rates in southern and eastern Europe, in South America and in Asia.

There were varying patterns in the course of the birth rates after 1937. In the case of Germany, the birth rate began to rise shortly after the National Socialists came into power; by 1937 the rate was 18.8 per 1,000 with a rise continuing to a peak of 20.3 in 1939. This prewar rise was attributed by D. Kirk (Milbank Memorial Fund Quarterly, vol. xx, April 1942) to improvement in employment conditions, rather than to the intense propaganda conducted for more and larger families. Despite Germany's efforts to maintain her birth rate in the early years of World War II, the figure fell to a low point of 14.9 per 1,000 in 1942. Italy, which had a policy in effect after 1927 to stimulate her birth rate, had a birth rate of 22.9 per 1,000 in 1937, while her war with Ethiopia was in progress, compared with a level of 23.8 in the years of peace from 1931 to 1935. In 1938, after the end of this war, the rate rose to 23.6, a level which was maintained through 1940. The effect of World War II, however, was to reduce Italy's birth rate sharply, to a figure of 20.5 per 1,000 in 1943, the last year of record during the war. Japan, the remaining axis partner, had a birth rate of 30.6 per 1,000 in 1937; this fell sharply to 26.7 in 1938, the year after Japan became involved in large-scale hostilities with China. The rate rose subsequently to 29.9 in 1941, her last year of peace with the U.S.; later data were not available. Japan, like her axis partners, undertook measures to stimulate her population growth. These measures, announced by the cabinet on Jan. 22, 1941, had among their objectives the avowed purpose of supplying military and industrial manpower for the country, and also producing enough population to distribute throughout Asia to maintain a wai-won leadership.

While World War II adversely affected the birth rates of Germany and Italy, the English-speaking countries experienced increases. For example, in the U.S., the rate rose from 17.3 per 1,000 in 1939 to a peak of 21.5 in 1943, but then fell to 19.8 in 1945. The wartime movement may be attributed to several factors. First, the prosperity of the war years, even before the U.S. entered the conflict, gave many couples the opportunity to have children they could not afford in the preceding years of depression. Secondly, there were undoubtedly instances in which births were planned in order to have a basis for exemption from military obligation. On the other hand, there was the natural consequence of the many marriages undertaken in anticipation of military service. The withdrawal of many millions of men for service abroad beginning in 1943 had its adverse effect on the birth rate in 1944 and 1945.

The record for Canada was similar to that of the U.S., but the birth rates lay at a high level; the rate rose from 20.3 per 1,000 in 1939 to 24.0 in 1943.

The first effect of World War II upon the birth rate of England and Wales was a reduction from 14.9 per 1,000 in 1939 to 14.0 in 1941. The principal factors in this decline were the withdrawal of men for the armed forces, disruption of family life in cities when wives and children were sent to rural areas, demand for women's services in industry, and devastations by German air bombings. However, as conditions in England and Wales became stabilized, and with the bulk of the army still in the homeland, the birth rate began to rise, reaching 17.5 per 1,000 in 1944. Some of this rise may also have been due to births postponed from the few prior years. The experience of Scotland was much like that of England and Wales.

Although the wartime trend of the birth rate in England and Wales was favourable, the prospective trend of population growth there had, for some time previously, been a matter of concern. This led to the appointment, on March 2, 1944, of a Royal Commission on Population whose duty it was "to examine the facts relating to the present population trends in Great Britain; to investigate the causes of these trends and to consider their probable consequences; to consider what measures, if any, should be taken in the national interest to influence the future trend of population; and to make recommendations." The commission had three technical committees to study the statistical, the economic, and the biological and medical phases of the problems involved.

A statement by the royal commission on population, dated Sept. 1945, drew attention to the need for more facts for the study of population trends in Great Britain. It was pointed out that births averaged 1,064,000 annually in the period 1900-09; this number fell to an annual average of 701,000 during 1930-39. As a result of this downward trend, the proportion of young persons in the population decreased while that of old persons increased. The statement continued: "If the average size of family were to remain as it was before the war, a time would inevitably come when there would be more deaths than births." The commission had no evidence that the decrease in the average size of family was due to increased physiological sterility. Rather, the evidence was to the effect that the widespread practice of birth control was the direct cause of the decline in the birth rate. The statement was made by the commission that a continuance of the trend toward population decline would adversely

affect the position of Great Britain in the world. In order to obtain the needed facts regarding family characteristics, the commission recommended that a sample census be taken of married women.

The birth rate in Australia rose, year by year, from 17.4 per 1,000 in 1937 to 21.0 in 1944. New Zealand had its peak rate of 22.8 in 1941, with two subsequent years of decline. The Union of South Africa (white population) maintained its birth 1ate in the war years through 1942 at its prewar level, but turned sharply upward in 1943.

Of the German-occupied countries, Belgium had a severe drop from 15.3 per 1,000 in 1939 to a low of 12.1 in 1941, the year after her invasion; the reported rate rose thereafter, and in 1944 and 1945 it was practically at the prewar level, the rate for the last two years being 15.2. France, which had already been experiencing higher death rates than birth rates for many years, suffered a decline in her birth rate from 14.6 per 1,000 in 1939 to a low of 13.0 in 1941; at the same time, her death rate rose sharply. A rise in birth rates was reported for France from 1942 to 1944. For the occupied Netherlands, the reported birth rates were practically at the prewar level, while Norway's reports showed increases after 1941; however, these reports, like those for Belgium and France, were of questionable reliability. There were no birth reports for Poland after 1939, the year of her invasion, nor for Yugoslavia or Greece after 1940.

Of the neutral countries in World War II, Sweden was favoured with a steadily rising birth rate, except for one year; here, the rate increased from 14.4 per 1,000 in 1937 to 20.3 in 1944. Switzerland likewise showed an upward trend, from 15.0 in 1937 to 20.2 in 1945. The rise in these two countries evidently reflected their wartime prosperity. During the war years, Portugal had birth rates somewhat lower than its prewar level, while the record for Spain, based upon provisional data, showed no consistent picture.

After an examination of existing literature bearing upon the question whether the ratio of males to females at birth increases in wartime, C. Panunzio in the Milbank Memorial Fund Quarterly (July 1943) concluded that there was some evidence, not wholly conclusive, indicative of such an increase.

Fertility rates according to age of father are shown in the lower tier of Table II. By comparing, age for age, the rates for men with those for women, it will be observed that the latter had the greater rates at ages under 25, and that at the higher ages the situation was reversed. For example, at ages 15 to 19, the fertility rate for women (51.4) in 1944 was more than five times that for men (9.8); at ages 25 to 29, men had a somewhat higher rate (135.8 against 132.0), and at ages 45 to 49, their rate (19.5) was 18 times that for women (1.1).

The rise in fertility rates among men during the war period was most rapid at the youngest ages. At ages 15 to 19, the rate rose from 6.0 per 1,000 in 1939 to a peak of 10.4 in 1943; the relatively rapid gain from 1942 to 1943 in this age period was induced, quite likely, by the draft of men from age 18 up for the armed forces beginning early in 1942. The age group 30 to 34 also had a peak in its fertility rates in 1943. For the age groups from 20 to 29, the peak in the rates came one year earlier, in 1942. However, at ages 35 and over, the wartime trend in fertility rates was upward through 1944. The situation behind these movements in the fertility rates according to age of father was the same as that discussed later in connection with the fertility rates for women.

The largest relative increase in number of births from 1940 to 1943, the wartime peak year, was in families where the father was under 20 years old and the mother was of ages 20 to 24, the rise amounting to 74%.

In 1940, while the fertility rates were not yet influenced by the entry of men into the armed forces, the average age of fathers was 32 years, while that for mothers was 27½ years. The higher average age of fathers arose from their higher average age at marriage and the longer reproductive life for men than for women. More than one-tenth of the white women bearing children in 1940 were under 20 years of age; one-quarter of them were under 23 and one-half of them were under 26, but only one-tenth were over 35. In the case of white men to whom a child was born during 1940, only one-tenth were under 23, one-quarter under 26, one-half under 30, and one-quarter over 35.

Fertility Rates According to Age of Parents.-Natural population growth takes place by excess of births over deaths. But birth rates computed as the ratio of total annual births to total population give only an imperfect and often misleading gauge of the capacity for growth of the population. Actually a population may, for the moment, sustain or even increase its numbers by a balance of annual births over annual deaths, while in fact it is failing to reproduce itself. This is because the birth rate is the resultant of two influences, namely on the one hand the fertility of that part of the population which is in the reproductive ages of life; and second, the proportion of the total population which at the time is comprised within the reproductive ages. Hence, the effect of a relatively low fertility may be masked by the influence of a temporary high proportion of the reproducing contingent. Clearly, to obtain a true insight in the capacity for growth, it is necessary to probe more deeply and to examine not only the crude birth rates and death rates, but to study the fertility rates of specific contingents of the population, and, in particular, to observe age-specific fertility rates.

Statistics published by a number of countries furnished the required data to compute fertility rates according to age of mother, that is, the annual number of children of both sexes born to mothers of a specified age group, per 1,000 women within that age group. The fertility rates obtained by such a computation, for women in the United States are shown in Table II for each year from 1937 to 1944.

The fertility rate among women in the U.S. was at a peak at ages 20 to 24 years during the period of survey. In 1944, the rate, per 1,000 females, was 0.7 at ages 10 to 14; it was 51.4 for ages 15 to 19, and had a maximum of 141.7 at ages 20 to 24. The decline beyond this age group

*Rates are based upon male population of ages 55 to 59.

was gradual, reaching a level of only 1.1 per 1,000 at ages 45 to 49.

It will be noted in the upper tier of Table II, that the wartime rise in the fertility rates reached a peak in 1942 for women of ages 20 to 24 years, while women of ages 15 to 19 and of ages 25 to 34 had their peak rates in 1943. In the case of women 35 to 44 years of age, the year 1944 showed the highest rates since 1939. On the other hand, the decline in fertility rates among women 45 to 49 years in evidence before 1939 continued through 1944.

Fertility Rates According to Order of Child at Birth.—Table III exhibits for the United States and for each year from 1937 to 1944, the number of children of specified order born per 1,000 females at ages 10 to 54. In 1944, there were 20.3 first births per 1,000 women of ages 10 to 54; there were 15.9 second births, 9.2 third births, 5.0 fourth, 2.9 fifth, 3.1 sixth or seventh and 2.6 children of eighth or higher order.

Table III.—Births per 1,000 Females of Ages 10 to 54, According to Order of Child at Birth, United States, 1937–44

Order of Child at Birth	1937	1938	1939	1940	1941	1942	1943	1944

Eighth and over	3.0	2.9	2.7	2.6	2.5	2.4	2.5	2.6

Counting first births only, the fertility rate per 1,000 women of ages 10 to 54 rose from a prewar level of about 19 to a peak of 24.9 in 1942 and then declined in the next two years. Most of these first births occurred among young mothers whose husbands were, for the greater part, at ages subject to military service from the time of the first draft in 1940. The peak year in the fertility rate for second births was 1943, the rate being 17.0 per 1,000. The decreases in the rates for first and second children in the later war years may be attributed largely to the withdrawal of husbands in the armed services for overseas duty. In the case of third and fourth children, the wartime increase in the reproduction rates continued into 1944, the figures being 9.2 and 4.0 per 1,000 respectively. The fathers of these children were mostly men at the older ages, outside of the armed forces, and were sharing the benefits of the high level of employment during the war period. The fertility rates for fifth children also shared in the late wartime rise, but only to a limited degree. For children of sixth, seventh, eighth and higher orders, the fertility rates maintained their prewar downward trend through 1942, the next two years showing small increases; apparently, the prewar trend toward smaller families was hardly influenced by the wartime industrial boom.

Reproduction Rates.—In computing fertility rates it is natural to include children of both sexes. But if the problem to be considered is to what extent the population is reproducing itself from generation to generation, a more direct index is obtained by concentrating on one sex. The usual procedure is to keep count of the number of daughters produced by mothers. Just as the figures exhibited in the upper tier of Table II were computed for children of both sexes, a corresponding set of figures can be computed counting females only. The rates so computed are generally spoken of as age-specific reproduction rates, and by summing these rates for all the five-year groups within the reproductive period (and multiplying by five to allow for the 5-year range of each group) a total "gross" reproduction rate is obtained. Examples of such rates for a number of countries for the period 1937 to 1943 are shown in Table IV.

It will be noted that most of the gross reproduction

rates were not very far from unity. The significance of this fact deserves special note. A country in which the

total gross reproduction rates were unity would just reproduce its population from generation to generation if there were no deaths among females from the time of birth to the end of the reproductive period. Since there are such deaths, allowance must be made for them to obtain the final criterion of a "net reproduction rate." This is effected by tracing a group of say 100,000 females from birth to the end of their reproductive period with suitable allowance for survival on the basis of current death rates at each age, and noting how many female births would occur among them if they experienced at each age their reproduction rates currently observed in the population. The ratio of the resulting total number of female births to the original 100,000 newborn females is termed the "net reproduction rate" per generation.

In Table V it is seen that the net reproduction rate for white females in the U.S. in 1937 was only 0.97, indicating that conditions of reproduction and mortality in that year were such as to lead to an ultimately declining population. However, for the next year (1938) and for the period 1939–41, the net reproduction rate was practically unity; the rate rose rapidly to a peak of 1.24 in 1943 and then declined somewhat to 1.16 in 1944. The high wartime net reproduction rates were only temporary; it was to be expected the rate would return to essentially prewar levels. England and Wales, during the period 1937 to

1942, had net reproduction rates of the order of .8, indicating a situation leading rapidly to an ultimately

declining population; the rise in subsequent years, though marked, led to a rate of only .99 in 1944. Among the other countries in Table V with prewar reproduction rates well below unity were Belgium, Denmark, Finland, France, Germany, Norway, Scotland, Sweden and Switzerland; countries with rates well above unity were Egypt, Japan and the Union of South Africa (white population).

Completeness of Birth Registration.—Even in the relatively few countries of the world providing for systematic registration of births, the quality of the records is uncertain because of the possibility that some births may fail to be reported. In order to test the completeness of birth registration within the U.S., the bureau of the census of that country provided for a birth registration test to be made in conjunction with its 1940 census of population. Census returns of infants on April 1, 1940, were compared with the birth and death certificates filed during the four-month period from Dec. 1, 1939, to the census date. A report (U.S. Bureau of the Census, Vital Statistics-Special Reports, vol. 23, p. 97, Nov. 1945) showed that during the test period, 92.5% of the actual births in the U.S. were duly registered. For white births, registration was 94.0% complete and for all other races it was 81.5%. The completeness of registration decreased with the size of the community. In cities of 100,000 or more, 97.7% of the births were registered; for cities of 10,000 to 100,000, it was 96.0%; for communities of 2,500 to 10,000, it was 92.0%, while rural areas reported only 86.5%. On the whole, registration was most complete in the states of the northeast and on the Pacific coast, and least complete in the south central states.

Person in Attendance at Birth.-Hospitalization for maternity cases in the U.S. increased steadily. In 1935, the first year for which the data were collected, only 36.9% of all births were attended by a physician in a hospital; this rose to 75.6% in 1944. Meanwhile, the proportion attended by a physician elsewhere fell from 50.6% to 17.7%, and the proportion by midwives from 10.7% to 6.4%. There was a fairly definite geographic pattern in the extent to which medical attendance at birth varied within the U.S. High percentages were usual in most of the northern and western states, while the smallest proportions of births attended by physicians were found in the south. In the following states, more than 90% of the births in 1944 were attended by a physician in a hospital: California, Connecticut, District of Columbia, Idaho, Illinois, Massachusetts, Minnesota, Montana, Nevada, New Hampshire, New Jersey, New York, Oregon, Rhode Island, Utah and Washington. Among residents of urban areas, 89.1% of the births in 1944 were in hospitals, 8.4% were attended by a physician outside a hospital, 2.3% were attended by midwives, with the remainder unspecified; the corresponding percentages for live births among rural residents were 56.9, 30.4 and 12.1. For the country as a whole, 81.0% of the white births were attended by a physician in a hospital while among the Negroes, the figure was 37.0%. On the other hand, attendance by midwives in the case of Negro births was much more frequent than among white births. The increasing use of hospital facilities at maternity was undoubtedly an important factor in reducing maternal mortality and infant mortality to their 1946 low levels. A wartime factor encouraging increased use of hospital facilities for maternity was the grant provided to wives of men in the lower ranks of the armed forces by the Emergency Maternal and Infant Care act (1943).

Research.—An analysis of some social and psychological factors affecting fertility, based on the records of native white couples in Indianapolis, Ind., was presented by P. K. Whelpton and C. V. Kiser in the Milbank Memorial Fund Quarterly, July 1943. In summarizing the first results of the investigation, the authors found that fertility among Catholic couples was 18% greater than that among Protestants. On the other hand, mixed Protestant-Catholic unions were 10% less fertile than those of Protestants alone. Jewish couples were 25% less fertile than Protestants, but this finding was based upon a small sample. The authors also found confirmation of the usual relation that fertility decreases with advance in socio-economic status, whether measured in terms of rent paid (or the equivalent rental value for home owners) or educational attainment of husband and wife. An exception noted in the upper rental brackets was accounted for by the greater fertility among home owners, for fertility rates remained low among home renters in this bracket. The variation of fertility with socio-economic status was found to be much less marked among Catholic unions than among Protestants. There were definite indications that the greater fertility of Catholic couples as compared with Protestant tended to be concentrated in the higher socio-economic

In a Canadian report on "Occupational Differences in Fertility," based upon the 1941 census (Bulletin No. F-3, Dominion Bureau of Statistics, 1945), it was found that in occupational groups in which the members were of like educational status, fertility tended to increase with income. As in other studies, it was observed that fertility decreased with advance in socio-economic status (occupations were grouped into socio-economic classes on the basis of educational level and average earnings). Except for clergymen, every occupational class had a smaller average size of family in metropolitan areas than in the country outside these areas. An earlier study on "Cultural Differences in Family Size" (Bulletin No. F-2, 1945) pointed to decreases in average size of family with advance in educational status for all religious and mother tongue groups. A report on "Trends in Canadian Family Size" (Bulletin No. F-1, 1944) showed that early marriage influenced family size by a longer reproductive period, by fewer childless marriages, and by a greater rate of issue within a given length of married life. The data also indicated a trend toward increasing proportions of childless marriages and two-child families.

A study by Paul H. Jacobson (Milbank Memorial Fund Quarterly, April 1944), using data for the white population in New York city from 1929 to 1942, showed a reduction of the differential in the birth rates among the various economic levels. This particular situation was considered indicative of a widely prevailing trend. It was found, moreover, that the recovery in the birth rate after the depth of the depression was not as rapid for the lowest economic group as it was for the highest. There was no indication that families accepting public relief increased their birth rates after receiving such support.

The sex ratio (males per 1,000 females) among live births, based on U.S. data for 1933-41, was 1,058 for the native white population (Statistical Bulletin, Metropolitan Life Insurance Company, Oct. 1944). When the age of the mother was taken into account, the ratio among live births was found to range from 1,061 at ages under 20, to 1,050 at ages 40 to 44, and 1,039 at ages 45 and over. This decrease in sex ratio with advancing age of mother was the combined effect of two factors. First, the sex ratio among stillbirths, which were not included in the

foregoing figures, was much higher than among live births—it was actually 1,293 among native whites. Secondly, the ratio of stillbirths to live births increased, with age of mother, from 27.9 per 1,000 at ages under 20, to 71.7 per 1,000 at ages 45 and over, in the period under discussion. When the sex ratio was computed for total births, including stillbirths, there was much less difference between the figures for the young mothers and for the older mothers than when live births alone were considered. Actually, for total births the ratio was 1,067 at ages under 20; it was 1,061 at ages 40 to 44, and 1,055 at ages 45 and over. (See also Birth Control; Census Data, U.S.; Death Statistics; Infant Mortality; Marriage and Divorce.)

Bismuth

With no reports on output from the United States, the largest producer, it was impossible during the years of World War II to estimate world production of bismuth with any degree of accuracy. Known outputs during World War II were of the following order in the main producing countries:

 Peru
 675,000-1,000,000 lb.

 Mexico
 200,000- 400,000 lb.

 Canada
 7,500- 400,000 lb.

 Other countries
 90,000- 150,000 lb.

 World total
 2,200,000-3,750,000 lb.

By difference it developed that the U.S. output was 1,000,000 to 2,000,000 lb., with the minimum in 1939 and the maximum in 1942. As can be judged from the above figures, the output varied widely from year to year in most countries.

In spite of its large domestic output, the U.S. used imports of 300,000 to 600,000 lb. annually. The War Production board reported U.S. consumption at 2,004,391 lb. in 1943, 1,465,640 lb. in 1944 and 1,635,293 lb. in 1945. Of these combined totals, 47% was used in pharmaceuticals, 28% in fabricating alloys, 10% in ammunition alloys, 4% in fuse alloys, 1% in aluminum alloys and 9% in other uses. "Fabricating alloys" are largely alloys with lead, tin and cadmium, useful because of their low melting points and their lack of contraction on solidification.

In war uses, beside the ammunition solder, bismuth was employed in aluminum alloys for cylinder heads in aviation engines, in atomic bombs, radar equipment and various other uses.

Black, Hugo Lafayette

Black (1886—), U.S. jurist, was born Feb. 27, 1886, at Harlan (Clay county), Ala. Educated at the University of Alabama, where he received his law degree in 1906, he practised law until his election to the U.S. senate in 1926 on the Democratic ticket. Re-elected in 1933, he was appointed Aug. 12, 1937, associate justice of the U.S. supreme court by Pres. Franklin D. Roosevelt. His appointment was confirmed by the senate five days later. Black main-

tained his reputation as a liberal in many court rulings. However, a disclosure by the *Pittsburgh Post Gazette* that Black had once been a member of the Ku Klux Klan, together with the newspaper's claim that he had rejoined the organization after having once resigned, caused considerable embarrassment to the administration. Black explained Oct. 1, 1937, that he had joined the Klan 15 years earlier but had never rejoined, declaring that he could not consider an "unsolicited" Klan membership card given him in 1926 as membership of any kind. Criticism continued despite this explanation, but the furore gradually subsided.

On June 10, 1946, Justice Robert H. Jackson, who was on leave from the court to act as prosecutor at the Nuernberg war crimes trial, opened a new controversy centring on Black, charging that the latter had participated in decisions involving one of Black's former law partners. Jackson's accusation said continuance of such practices would bring the high court into "disrepute." Black himself made no statements, but his supporters maintained that he had dissolved his association with the law partner mentioned some 19 years earlier and emphasized that participation in any court case was left to the discretion of the individual justices.

Black Markets

During and immediately after World War II, when sales of most goods and services were under price ceilings and a number of scarce and essential commodities were rationed to consumers, the term "black market" was generally used to cover all sales and purchases made in violation of these price and rationing regulations.

In the United States.—The use of this term, commonly associated in the public mind with extra-legal distribution systems in European countries under the German occupation, caused a certain amount of confusion in the U.S. Black markets in the U.S. did not have an existence separate from ordinary channels of trade, but rather came into being whenever a sale was made at an illegal price or, if the commodity were rationed, without the exchange of ration evidences. With few exceptions, the persons who sold goods in violation of price and rationing rules were persons who had been engaged in the sale of the particular type of goods long before the regulations were established, and the transactions took place in the same offices and shops in which the goods had long been sold.

The volume of such illegal transactions, compared with the total commercial activity of the period, was not large. The amount of black market activity in any given field, however, bore a direct relation to the severity of the shortage. In certain commodities at certain times, as for instance in the textile market during the winter of 1945-46, or in the meat crisis that recurred every spring, the combination of shrunken supply with abnormally swollen demand produced a situation in which the temptation to charge "all the traffic would bear" infected a substantial number of the sellers. In such a situation, those members of the business community willing to pay and charge illegal prices succeeded in handling a disproportionate share of the supply of the particular commodity. This aggravated the shortage in the rest of the market, and tended to create an impression among anxious purchasers that the commodity had disappeared into the black market.

In this way was created what might be called the myth of the black market, as distinct from the objective use of the term by enforcement agencies and students of the phenomenon. When a highly-wanted commodity Decame

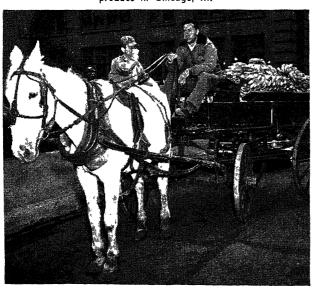

difficult to procure, every disappointed seeker was sure to have heard of at least one instance in which someone else had made a purchase under illegal circumstances. The prevalence of such stories, and the relative frustration facing legitimate purchasers, made it easy for the superficial observer to conclude that the commodity had disappeared not into the machinery of war but into some mysterious dimension known as the black market. If this black market could be discovered and destroyed, the theory ran, goods would again reappear in normal channels.

In actual fact, the transactions covered by the term black market neither added to nor subtracted from the amount of any commodity ultimately reaching the public. When such transactions became widespread in any field, however, they did act against the public interest in three serious ways. They increased the prices paid by consumers, and contributed to inflation. They distorted the fair distribution of goods, since merchants and manufacturers who were unwilling to pay and charge more than ceiling prices had more difficulty in securing supplies than less scrupulous buyers. And, when rationing or allocation orders were violated, black marketing diverted goods from more essential to less essential wartime uses.

Responsibility for preventing these violations, along with responsibility for issuing the regulations themselves, was assigned to the Office of Price Administration (q.v.). The office approached this responsibility in two ways. First, a continuing educational campaign was developed to inform industry and consumers of the provisions of the regulations and the reasons behind them. Industry advisory committees, national and local consumer organizations, newspapers, magazines, radio networks and other media assisted the government in the educational project. Thousands of volunteer assistants on local price and rationing boards explained the system of control to merchants and consumers in their own communities.

Second, an enforcement department was organized within the OPA to deal with violations that occurred in spite of all educational measures. This department consisted of units of attorneys and investigators specializing in the various commodity fields. Investigators were trained in the

Impersonating peddlers, two agents of the OPA posed as black marketeers in 1946, to test a suspected national outlet for fruit produce in Chicago, III.

business practices and bookkeeping methods of the industries to which they were assigned.

Since its investigative staff averaged only about 3,000 men during most of the period, the department operated on investigative programs carefully worked out for efficient use of manpower. Its efforts were supplemented in some fields by co-operation from the secret service and alcohol tax unit in the treasury department and occasional help from other government enforcement agencies. Civil suits for injunction, treble damages (three times the amount of any overcharge) and suspension of a seller's licence to handle goods subject to price control were prosecuted against violators by OPA's own attorneys; other cases were turned over to U.S. district attorneys for criminal prosecution. During three years and nine months of price control for which comparable figures were available (Jan. 1943 through Sept. 1946), OPA conducted more than 1,280,000 investigations and found violations in approximately 70% of the cases. An average of 4,500 civil and criminal actions was filed monthly in civil and criminal courts.

In the summer of 1944 a separate unit of highly trained criminal investigators, drawn from the FBI, treasury investigation unit, state and local police departments, as well as OPA's own ranks, was added to this department to deal with situations in which professional criminals had appeared. These investigators, the OPA special agents, were used for the first year of their existence to break up groups of racketeers engaged in counterfeiting, stealing and distributing ration currency. When, after V-J day, all commodities except sugar had been removed from rationing, the special agents were assigned to assist in getting evidence in the more devious types of price violations which appeared during the later years of the program. Determined violators developed techniques for concealing overcharges which were not readily picked up from an examination of books and records. The simplest was the payment of "side money" in cash, which was not entered on the books of either the buyer or seller. In cases in which buyer or seller had to keep books, various types of false and fraudulent invoices were developed. Most common were invoicing for a higher grade of the commodity than that actually purchased, for a larger quantity than that actually delivered, or for items that were never received. When both parties to such a transaction insistently denied that it had occurred, proof of the violation became extremely difficult. However, commodity specialists and special agents working together unmasked and stopped a great number of such conspiracies.

Commodity-wise, the most flagrant black markets appeared in gasoline and food rationing evasions—primarily through the circulation of counterfeit or stolen coupons or forged ration checks—and in meat, lumber, used automobiles and rental accommodations. (W. E. Ry.)

In Great Britain.—The most serious factor in the British black market of World War II was that it led inevitably to an increase in ordinary crime. The thieves who previously had confined themselves to stealing only certain articles widened their scope to include food, tobacco, clothes, drink and such household articles as curtains, carpets and even furniture. They knew that there was a ready sale for all these things at far better prices than a receiver of stolen goods would have paid in normal times. In the last resort the responsibility for the black market rested upon the public, who, irked by the shortage of such goods, bought them well knowing that it was unlawful to do so, without pausing to consider the origin of supply.

Although persons in all walks of life were prepared to buy things of which there were shortages, this kind of black

A Belgian black market operator on the Rue du Radis, Brussels, in 1945. Cigarettes sold at upward of 90 cents per package. British and U.S. rations, from chewing gum to meat, were either displayed or stored in pockets

market was fairly harmless in Great Britain, in the sense that it did not interfere with the national economy, because the black market in essential foodstuffs was kept under control throughout. No citizen failed to get the standard ration of meat, bread, fats and sugar, and although occasional truck loads of these articles were stolen, the total loss was small.

In eggs, poultry, tomatoes and various fruits, a large "under the counter" trade existed. Unscrupulous persons toured the country districts, buying up what they could and selling at high prices in the big towns to such an extent that the diet of persons unable to supplement their rations by underground methods became most monotonous. Black market transactions of this comparatively mild type were helped by the readiness of almost everyone to get some little extra for themselves and their families.

As World War II progressed, all other commodities, in addition to foods, came under government control. For gold, diamonds, platinum, etc., a black market hardly existed, but the control led to a large amount of smuggling from one country to another, for the reason that these commodities were regarded as stable in value, whenever the currencies of the various nations appreciated or depreciated in accordance with the fortunes of war.

As long as the prohibition on private motoring was maintained in Great Britain, the black market in gasoline was fairly small, but as the ban was relaxed the market grew. The total amount involved was made up from small deals between driver and garage owner, and it is doubtful if any big organization existed for illegal transactions. A vast conspiracy in linseed oil between a number of truck drivers and receivers was unearthed. More than 100 persons were prosecuted and long terms of imprisonment were awarded to the principals.

In Europe.—In such countries on the continent of Europe as the Netherlands, Belgium and France the black market assumed a different form. During the occupation by

the Germans, people in the big towns had to live on the black market or starve; in addition, it was considered patriotic, as the goods thus bought were kept out of the hands of the occupying forces. When liberation came, the black market remained but assumed a gray shade. Since the newly formed governments could not start the control of a proper issue of rations, all classes had to resort to the black market, and prices, although much higher than was fair or proper, were kept within the reach of most. In occupied territory where shortages were extreme and money had become less valuable, barter was often used and commodities such as cigarettes replaced currency. This method was evident in Germany, where the ordinary citizen had small use for money. Little could be bought in shops, and most transactions for essential goods were carried through by barter in the black market. In Italy also, where no confidence was felt in the future of the lira, everyone was eager to possess commodities rather than currency, and black market dealing had become universal by the end of World War II. (R. M. Ho.)

In Germany and Italy, considerable black market dealings were entered into by the occupying Allied forces. Cigarettes especially were sold (in Germany five marks for one cigarette became the general rate, varying with local conditions). The marks or lire so obtained by the soldier were used instead of drawing upon pay or were exchanged for other currencies on proceeding out of occupied territory. In this way, large amounts of unbacked marks and lire were converted into dollars or sterling. In the summer of 1946, the British authorities introduced token money as the only legal tender for the British occupying forces in Germany and thenceforward did not allow marks to be exchanged for sterling. The U.S. control commission gave effect to a similar scheme in the U.S. zone of Germany on Sept. 17.

Blamey, Sir Thomas Albert

Sir Thomas Blamey (1884-), Australian army officer, was born in Wagga Wagga, New South Wales, on Jan. 24, 1884. He joined the Australian Commonwealth army in 1906, was chief of staff of the Australian corps in World War I and was knighted in 1919. He was 2nd chief of the general staff of commonwealth military forces (1923-25). In World War II, he fought with Australian forces in the middle east and was made deputy commander of British middle east armies in 1941. After Japan's attack in the Pacific area, Sir Thomas returned to Australia in March 1942. With the rank of lieutenant general, he commanded Allied land forces in the Southwest Pacific and was second in command to MacArthur. In May 1944, a bitter controversy arose between Sir Thomas and Lt. Gen. Henry Gordon Bennett, who charged that Blamey had forced him out of the Australian army because he (Bennett) was associated with the ill-fated Malaya campaign and because Sir Thomas felt that Bennett's subsequent escape from Singapore was "ill-advised." Blamey's reply was that Bennett had been placed on the retired list at his own request. Sir Thomas participated in the Japanese surrender ceremony on Sept. 2, 1945, signing the

surrender document for Australia. On Dec. 19, 1945, it was disclosed that he had been succeeded as chief of the Australian general staff by Lt. Gen. V. A. H. Sturdee.

Blandy, William Henry Purnell

Blandy (1890—), U.S. naval officer, was born June 28, 1890, in New York city, N.Y. He was graduated from the U.S. naval academy at Annapolis in 1913 at the head of his class. Specializing in ordnance work, he was advanced to the temporary rank of rear admiral and was appointed chief of the navy's bureau of ordnance on Feb. 19, 1941. He held this post until 1944, when he was transferred to the Pacific as commander of amphibious task group 1, and participated in naval operations at Saipan, Iwo and Okinawa.

On Jan. 13, 1946, Blandy, who had been raised to the rank of a vice-admiral, was made special weapons head of the navy and later became commander of joint task force 1 for the army-navy-air atomic bomb tests at Bikini atoll. Criticism of the test raged in the months before the operation took place. To charges that the test might be construed by foreign countries as a "martial gesture," Blandy answered that the operation was a "defensive measure" of caution and economy rather than one of "aggression." He also minimized the cost of the test, put at \$100,000,000, declaring it would "not exceed the total cost of one large new ship."

Following the two atomic bomb tests on Bikini (July 1 and 25, 1946)—both of which were conducted under his supervision—Blandy declared that one of the lessons learned was that warships must be redesigned to fit the needs of the atomic age. In his report to Washington on Sept. 4, 1946, he revealed that all but 9 of the target vessels were either sunk, damaged or contaminated with radioactivity in both tests. On Sept. 24, 1946, Adm. Blandy was named commander of the 8th Atlantic fleet, but under a naval reorganization plan, announced shortly thereafter, he was assigned to command the 2nd task fleet in the Atlantic.

Blitzkrieg

Bloch, Claude Charles

Bloch (1878–), U.S. naval officer, was born on July 12 in Woodbury, Ky., son of a Czech immigrant. He was graduated from the U.S. naval academy at Annapolis in 1899, served in the Spanish-American war and was cited for rescuing Spanish seamen from the burning ships of Adm. Cervera's fleet. Later, he saw action in the Philippines and in China during the Boxer rebellion. During World War I, he escorted troopships and merchantmen through the Atlantic war zones to European ports. Promoted to a captaincy in 1921, he was commander of the battle force with the rank of admiral in 1936, and two years later, he was appointed commander in chief of the U.S. fleet. He retained this post until Jan. 6, 1940, when he was sent to Pearl Harbor as commandant of the 14th naval district. He was stationed at this post during the attack on Pearl Harbor, Dec. 7, 1941. Although retired because of his age in 1942, he was retained on active duty as a member of the general board with the rank of admiral. Adm. Bloch figured prominently in the secret report (published Jan. 4, 1946) of Secretary of the Navy Frank Knox on the Pearl Harbor disaster. In it Knox said that Adm. Bloch had received a radio report from a destroyer in the early morning of Dec. 7, that it had (then believed) sunk a submarine with depth charges. After giving the report some thought as the possible start of axis action, Bloch (Knox said) dismissed it in view of similar false reports in the past.

Blockade

Blockade is a legitimate form of sea warfare mainly intended to deny supplies to an enemy country. Its method of application varied from time to time until in World Wars I and II it developed into an endeavour to starve into submission. Blockading warships intercepted merchant shipping and maintained the right of search, escorting neutral ships if necessary into areas where an examination service was in force. The principles of blockade were violated to such an extent that the word largely lost its original meaning after the term "total warfare" came into existence. In the American War of Independence and in the Civil War between the northern and southern states, running the blockade was considered an honourable adventure, and the blockade runners were treated, if captured, in a humanitarian fashion. However, the introduction by Germany of ruthless submarine warfare put an entirely different complexion on the business of blockade. In World War I, the Allies captured German merchant shipping according to convention and even gave "days of grace" permits to such vessels in the early days of war, and the idea of commerce-destroying submarines sinking at sight and leaving the crew of an enemy merchantman or of a neutral ship to drown was then as repugnant as the Belsen gas chambers were to civilization in World War II. Scientific war inventions, culminating in the longrange bomber and the atom bomb, nevertheless ruled out much of the fairness attributed to blockade. Yet it seemed in 1946 that blockade would remain the major and indispensable weapon of superior sea power.

A certain amount, not much, was learned by the United States in the Spanish-American war of 1898 concerning blockade in its second or "close" blockade meaning; and of "loose" blockade, or blockade on the high seas, the most intense and culminating state was unquestionably that attained in World War II by "submerged" blockade brought about in the North Atlantic by the wolf-packs of German submarines the efforts of which cost Allied shipping millions of tons of valuable cargo and thousands of valiant lives. These blockading sea-wolves were eventually overcome by the little ships—destroyers, frigates and corvettes—the "asdic" wolf-hounds who hunted them clear of the slow-moving convoys of tramps and destroyed them more quickly than they could be built.

As long as the merchant ship remained the standard means of carrying to a country her foodstuffs, munitions and other supplies, blockade would be a vitally important factor in war, the convoy system would doubtless continue to be employed to bring in these supplies, and the fight would be between the convoy escort and the attacking forces employing such weapons as bombs, torpedoes, gunfire and mines of various description. Fighter-aircraftcarrying merchantmen as well as naval aircraft carriers would continue to protect convoys against surface commerce raiders, submarines and long-range bombers. But the gauntlet of blockade must be run as it had been in the different seas, whether on the broad ocean highways or in the narrow waters like the Mediterranean or, indeed as was seen in the years 1942-44, on sea routes that run into high Arctic latitudes. Perhaps the tanker was the most vital and at the same time the most vul-

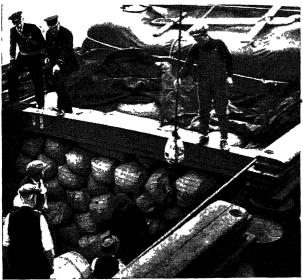

¹An electric anti-submarine detector listening apparatus.

nerable of all blockade-running craft, and the successful destruction of tankers would be as disastrous a blow to an island nation as anything imaginable when enforcing the blockade.

In World War I contraband and conditional contraband lists played an important role in ships' manifests and affected the blockading warship commanders' decisions as to search and permit to proceed, but "submerged blockade" made all forms of contraband and any other cargo lists purely futile when totalitarian war was being waged. In World War II, blockade was exercised by the Allies much more strictly. As early as 1940 Hitler was fulminating for the benefit of neutrals on the "misery" caused by the British blockade of European ports. Throughout the struggle the dominating purpose of the German war effort was to break the stranglehold which this blockade represented. As access to so many of the ports of Europe could be obtained only via the Straits of Dover, Gibraltar and Bab-el-Mandeb, the task of the royal navy during the first months of World War II was comparatively easy. Hence Germany's continual efforts to enlarge the area under the sway of its armies and so gain the use of ports in Norway and on the Atlantic coast of France. Thenceforward it was more than ever incumbent on the royal navy to maintain strong patrolling forces in the Atlantic to cover the northern and western approaches. These forces included air and submarine patrols. One of the objects of the German invasion of Norway was to secure exclusive supplies of Swedish iron ore and Scandinavian timber. The Balkans were next overrun, partly to tap fresh sources of chrome, lead, molybdenum and bauxite. Ultimately, like Napoleon, Hitler was impelled to launch an attack on Russia, convinced as he was that without her agricultural and mineral resources there was no hope for his victory.

From the outset of hostilities German merchant vessels, and later those of Italy, were precluded from navigating the high seas. Some were scuttled, but more took refuge in neutral ports in the hope of making their way home by stealth when a favourable opportunity should present itself. When the shortage of patrolling warships and aircraft which had tended to weaken the blockade in 1940–41 had been overcome, such opportunities became more and more hazardous, until by May 1944 it was possible for Lord

Cargo inspection by naval and customs officers for the British contraband control in World War II

Selborne, the minister of economic warfare, to declare that there were no longer any ocean-going blockade runners at sea. In the third season of blockade, between Nov. 1942 and May 1943, only two axis blockade runners got through out of 13. By Dec. 1943 the Germans were driven to the desperate measure of sending out from French Atlantic ports one-third of their entire available destroyer force in a futile endeavour to succour a single valuable blockade runner. Not only was the cargo lost, but three of the destroyers also were sunk.

In the Mediterranean during 1940-42 the chief task imposed on the British fleet was the interception of seaborne supplies for the axis armies in Africa. Surface vessels, submarines and aircraft together did much to weaken Rommel's position and so lead to his defeat at Alamein. Allied occupation of North-West Africa was a big step in the tightening up of the blockade of the axis powers, to whom it practically denied the use of such ports as Marseilles and Genoa for the import of supplies across the Mediterranean. It also enabled the ministry of economic warfare to take a firmer stand in its dealings with neutrals. By the employment of the compulsory system of "navicerts," 1 scarcely any overseas cargo could be loaded by neutrals without Allied approval. This system, of course, could be operated successfully only so long as the neutrals interested were convinced that any breach of Allied regulations was liable to lead to loss of cargoes and probably of ships as well. The few who tried to defy or evade the system found their names placed on a black list, and suffered accordingly. In some cases neutral ships were required, as a condition of their navicerts, to call at British contraband control ports for examination. There was a tendency to exaggerate the proportion of neutral shipping employed on German account. During the whole period of the war not more than 11/2% of Spanish and Portuguese mercantile tonnage was so operated. By 1944 this figure had been reduced to 1/2%, all of it in short voyages across the Bay of

In the later years of World War II, Germany urgently required rubber, tin and vegetable oils from the far east, while Japan was in equally desperate need of precision tools, heavy industrial plants and technicians from Europe. Efforts to run cargoes through in either direction met with the minimum of success. In 11 westbound blockade runners intercepted, the cargoes included 45,000 tons of rubber, 25,000 tons of vegetable oils and 1,500 tons of tungsten. Traffic thenceforward ceased, save for such "small parcels" as could be brought in an occasional submarine.

Attacks on axis coastal shipping in the Mediterranean, Baltic, North sea and elsewhere were another factor in tightening the blockade. Working in conjunction under the operational control of the admiralty, the royal navy and R.A.F. coastal command methodically harried axis coastwise traffic from Norway to the Aegean, contributing materially to the ultimate weakening of German resistance. Indeed, the whole blockade was well described by Lord Selborne as "a vast combined operation against the enemy's fighting power, outside and inside his frontiers, and on his coastal waters." Gradually economic warfare became concentrated upon control of the ferrous alloys, World War II being very much a "war of special steels." In 1944, agreements with Turkey and Spain went far to reduce Germany's supplies of chrome and wolfram to insignificant amounts.

Navigation certificates, delivered by British consuls in large neutral ports attested that cargo was free of contraband. A "navicert" was a "pass" through blockade.

At one period of the war, during the winter of 1943–44, British fast craft specially fitted out for the purpose contrived successfully to run the axis blockade of the Swedish ports on the Kattegat, only two vessels being lost. These were the "Gay Viking" (ex M.G.B. 506) and "Master Standfast" (ex M.G.B. 508). Cargoes so obtained consisted chiefly of ball bearings, so vital for mechanized modern war.

This material must have proved of the utmost value in the Allied advance following the Normandy landings shortly afterwards.

In the final state of the war in the Pacific, as well as in the later years of the war in Europe, mines laid by British and American aircraft were employed for blockade purposes.

Use of many North German ports on the Baltic was held up or greatly impeded by this means; and equal success was experienced in blocking Japanese harbours and the use of the narrow waters of the Inland Sea. (See Shipping, Merchant Marine; World War II.)

Thus the second World War of the 20th century drove home the lessons taught by the use of the blockade weapon in the long struggle with Napoleon. In similar circumstances the reaction of the enemy to the impact of the blockade weapon was much the same, and in the end it proved equally futile. (See also Strategy of World War II; Submarine Warfare.)

Blum, Léon

Blum (1872—), French statesman, was born in Paris on April 9, 1872, of well-to-do Alsatian-Jewish stock. He took degrees in philosophy and law and for some years practised law. He also worked as a drama critic and wrote a number of literary works. He became a Socialist early in the century and later entered actively in politics. A deputy for the Seine department, 1919–28, he represented the Narbonne department, 1929–40. In 1929, Blum became president of the parliamentary group of the Socialist party. An outstanding figure in French politics, Blum remained in the opposition until the popular front triumph in the national elections of May 1936 and on June 4, he became the first Socialist prime minister of France.

Following a sharp clash with a hostile senate over measures for resolving the country's financial difficulties, Blum resigned June 21, 1937. In the succeeding Chautemps government, Blum was deputy prime minister, 1937–38, but declined office in the Daladier government that followed. He was prime minister for 28 days of a short-lived government in March 1938. After the fall of France in 1940, he was indicted by the Pétain regime on war guilt charges and was brought to trial at the Riom proceedings, Feb. 19, 1942. Blum's spirited attacks on his accusers discomfitted the Vichy authorities, who suspended the hearings in April and returned him to prison. Later transferred to a German prison, he was freed by U.S. troops in May 1945 from a nazi concentration camp in the Italian Alps.

Two months after his return to France, Blum appeared (July 27, 1945) as a prosecution witness at le procès Pétain, accusing the aged marshal of treason. On Jan. 28, 1946, the French socialist was named special French ambassador to foreign countries with authority to negotiate foreign loans and he went to Washington, D.C., where he signed (May 28) an agreement with the U.S. settling French lend-lease accounts and securing credits of about \$1,370,000,000.

After Bidault's resignation as premier-president in late Nov. 1946, Blum was selected as a "compromise candidate," acceptable to Communists, Socialists and a small left Republican coalition to succeed Bidault. Although in ill health, Blum accepted the post on Dec. 12, 1946, and formed his interim cabinet on Dec. 16.

Bock, Fedor von

Bock (1880-1945), German army officer, was born Dec. 3, 1880, at Kuestrin on the Oder and was educated at the Potsdam military school. He entered an infantry regiment when he was 17, was a captain when Germany entered World War I, and attained the rank of major at the war's end. In 1938, Adolf Hitler named him commander of the 1st army group. During the French campaign (May-June 1940), he was in command of the lower Somme army group and on July 19, 1940, he was created a field marshal of the reich. Von Bock took command of the central German armies in the Russian campaign and dealt the Russians some of their most severe blows in the early phase of the fighting. In the fall of 1941, he unloosed six major drives against Moscow, but failed to take the city. He then began his series of "orderly retreats" and "defensive actions." Later, he was shifted to the southern front where he directed the columns that broke into Stalingrad. But his failure to wrest the city from the Russians went unappreciated by Hitler, who had him removed from his command in Oct. 1942. On May 6, 1945, it was disclosed that British forces north of Hamburg came upon the bullet-riddled body of Von Bock, who apparently had been killed a week earlier by Allied strafing planes.

Boisson, Pierre François

Boisson (1894~), French politician and government official, entered the colonial service in 1920 as an assistant administrator of colonies. By 1939 he had risen high in the colonial office and was made governor general of French Equatorial Africa. After the collapse of France

in 1940, Boisson served under the Vichy regime. Forces under his command repulsed the attempt made by Free French and British forces to seize Dakar in Sept. 1940. During his tenure, Boisson ruled with an iron hand, ruthlessly suppressed pro-Allied groups and allegedly permitted German U-boats to dock at Dakar. The Allied landings in Nov. 1942 weakened Boisson's position, and on Jan. 7, 1943, he agreed to support the Allies, promising them the use of men and materials. Charles de Gaulle, on his accession to power in French Africa, dismissed Boisson on July 3, 1943; six months later (Dec. 21), Boisson was arrested on charges of treason. He was freed by the High Court of Justice sitting in Paris, Nov. 28, 1945. However, on May 14, 1946, under a government decree penalizing colonial governors who sided with Vichy, Boisson was deprived of his decorations and was forbidden ever to receive a French or foreign decoration or a pension.

Bolivia

Bolivia, a landlocked republic in south central South America, lies between approximately 10° and 23° S. lat. and 58° and 70° W. long. The area was officially computed after the adjustment in the Chaco arbitral award in 1938 to be 419,470 sq.mi.; pop. (est. Jan. 1, 1944), 3,533,-900. Population density in 1944 was 8.49 per sq.mi. The population estimate in 1941 was 3,457,000, but all estimates were obviously subject to considerable error as the latest previous national census, admittedly incomplete, had been taken in 1900. Population estimates by departments in 1943 were as follows: Beni, 65,200; Chuquisaca, 414,300; Cochabamba, 665,100; La Paz, 903,200; Oruro, 174,500; Pando, 18,300; Potosí, 659,900; Santa Cruz, 424,800; Tarija, 208,600. The legal capital and seat of the supreme court is Sucre (est. pop., 1946, 32,000) but the real seat of government is La Paz (est. pop., 301,000), located at an elevation of 12,000 ft. above sea level and the highest large city in the world. Other cities (with est. pop.) include Cochabamba (60,000), Oruro (50,000), Potosí (40,000), Santa Cruz (32,800) and Tarija (27,000). Of the total population, 52.34% was classed as Indian, 27.5% as mestizo, 13.08% as white, 0.22% as Negro and 6.85% as unspecified.

Presidents during the decade 1937–46: Col. David Toro until July 13, 1937; Lt. Col. Germán Busch, July 13, 1937–Aug. 23, 1939; Gen. Carlos Quintanilla, Aug. 23, 1939–April 15, 1940; Gen. Enrique Peñaranda, April 15, 1940–Dec. 20, 1943; Lt. Col. Gualberto Villarroel, Dec. 20, 1943–July 21, 1946; Nestor Guillén, provisional president July 21, 1946–Aug. 16, 1946; Tomás Monje Gutiérrez, provisional president from Aug. 16, 1946.

Aftermath of the Chaco War.-Effects of the disastrous Chaco War between Bolivia and Paraguay, fought between 1932 and 1935, continued to condition developments in Bolivia for several years. The war was fought as a phase of the long-continued boundary controversy involving some 100,000 sq.mi. of the Chaco Boreal. The course of the war was generally favourable to Paraguay in a military way, but it was exhausting economically to both belligerents. A peace conference, opening at Buenos Aires, Argentina, in mid-1935, did not conclude its work until three years later. Col. David Toro assumed the presidency by force in 1936 and undertook a program looking toward eventual state socialism. In March 1937 his program brought him into conflict with the Standard Oil Company of New Jersey, whose 2,500,000-ac. oil concessions in southeastern Bolivia were ordered confiscated. The Toro regime was overthrown by a bloodless coup d'état on July 13, 1937, which brought 33-year-old Lt. Col. Germán Busch, of German descent, to power as provisional presi-

dent. Busch's position was later regularized, and he became constitutional president following the adoption of a new constitution late in 1938. He adopted a middle-of-theroad policy and abandoned the extreme manifestations of state socialism favoured by Toro; he abolished the censorship in effect since the beginning of the Chaco War, invited civilians into the cabinet and promised early elections. Busch refused, however, to restore the Standard Oil concessions and organized a government corporation to exploit the oil fields. By a treaty with Argentina, dated Nov. 19, 1937, Bolivia obtained the right to export petroleum, tax free, through Argentina. Despite the early promises of Busch, his regime was oppressive, and concentration camps were filled with his political opponents. His harsh and vigorous policy resulted in 1938 in continued political instability such as had characterized the country for a decade; several abortive revolutionary attempts occurred during that year.

The Chaco peace conference, after many threatened breakdowns, ultimately succeeded in concluding a treaty on July 21, 1938, followed by an arbitral award on Oct. 10, definitively marking the long-controverted boundary with Paraguay. Bolivia surrendered about 100,000 sq.mi. of territory it previously had claimed.

The government of President Busch took several significant steps toward the economic development of the country. Bolivia signed a treaty with Brazil providing for the establishment of railway communication between the two countries and the exploration and exploitation of Bolivian petroleum to supply the Brazilian market. This development was interpreted as a partial offset to the presumed infiltration which Argentina had been gaining in Bolivian affairs, especially in connection with its petroleum resources. The government offered inducements to immigrants during 1938, including free land grants in low-lying eastern Bolivia and financial aid while getting settled, but since the government's policy was one of slow infiltration of agricultural workers it gave little encouragement to efforts to obtain a haven for refugee Jews.

Governments by Force.—Busch caused an international sensation on April 24, 1939, by his announcement of assumption of a "totality of powers." He suspended the constitution, which had taken effect only six months before, dissolved the congress and the courts and cancelled the congressional elections scheduled for the following May 4. The new move was officially described as "Bolivian in nature" and designed to "redeem Bolivia from chaos" but it was interpreted in some quarters as indicating a close economic tieup with the axis powers in Europe. At the least, it was evidence of a tightening domestic political situation. Several prominent opponents of the government were arrested on May 12 and confined in a concentration camp. Gathering symptoms of anti-Semitism were brought into focus by revelations on May 25, 1939, about payments exacted of Jewish refugees by Bolivian consuls in return for valueless passports. The resulting political scandal forced the resignation of the foreign minister; his successor also resigned, Aug. 3, 1939, but in protest against the formal nationalization of the Central bank of Bolivia. Late in the same month, Aug. 23, 1939, President Busch died of a gunshot wound under somewhat mysterious circumstances. His death was officially announced as a suicide, but many informed persons regarded it as an assassination, although no one was ever punished for it. The minister of war, Gen. Carlos Quintanilla, succeeded as provisional president despite the specification of the

1938 constitution that the vice-president should succeed to the office. The new president pledged restoration of "constitutional normality" and on Sept. 27 suspended censorship and the onerous press restrictions; he subsequently set presidential elections for March 1940. Despite pledges of noninterference with the political processes, Col. Bernardino Bilbao Rioja, commander of the army and an avowed presidential candidate, was deported to Chile on Oct. 27 for "planning a revolution." Several days of serious disorder followed.

Gen. Enrique Peñaranda, a veteran of the Chaco War, was chosen president in the elections of March 15, 1940, to succeed Quintanilla; he took office the following month despite an attempted revolutionary coup on March 26 which sought to prevent his inauguration. President Peñaranda in May decreed a general amnesty releasing all political prisoners. Political unrest continued, however, with an especially serious outbreak in July 1940 and a profound cabinet crisis in November of the same year. Peñaranda, as had been true of Quintanilla, faced repeated revolutionary threats and maintained himself in office only by the use of strong force.

The new administration co-operated at least superficially with the United States and the other American republics in maintaining hemisphere solidarity. It was generally regarded as more conciliatory toward foreign interests than any other administration of a decade past. Increasing war demands resulted in better prices for tin and other metals important in Bolivian economy, and the United States consummated an agreement with Bolivia in Oct. 1940 by which the former country contracted to purchase 18,000 tons of tin annually for 5 years and 3,000 tons of tungsten annually for 3 years. Such developments materially improved Bolivia's economic situation. The country in 1941 continued to benefit at least superficially from wartime demands for its mineral production, especially tin and tungsten, but rapidly mounting living costs and a generally unchecked inflationary wave brought on extensive strikes and labour unrest. An executive decree on Aug. 22, 1941, ordered salary increases of from 5% to 30% throughout Bolivia, but continued price rises caused serious railway and other strikes in October.

In the meantime, Bolivia's role as a producer of essential strategic war materials and its long-continued domestic disorder made it fertile soil for nazi intrigues of various kinds. Nazi propagandists were active and the Auslandsdeutsche organization made strenuous efforts to enforce conformity among the German minority in Bolivia, estimated to contain some 1,400 non-Jewish Germans in addition to 3,500 nationals of German descent. As one means of combating German influence, the government on May 14, 1941, expropriated the German-owned and operated Lloyd Aéreo Boliviano air line which had for some years been flying Bolivian routes and with Brazilian connections, all with a substantial subsidy from the German government; expropriation was undertaken with the knowledge and sympathy of the U.S. state department. Rumours of a nazi coup d'état were prevalent in June 1941, and the situation reached a focal point with the disclosure the following month of an extensive plot in which the German minister, Ernst Wendler, was the key figure; a prominent Bolivian diplomatic official in Berlin was also involved. President Peñaranda acted with energy and dispatch, expelling Wendler from the country, proclaiming a state of siege (martial law) and ordering the arrest of many political opponents. The situation remained delicate, however.

Support for the Allies.—Bolivian relations with the United States in 1940 and 1941 continued to be complicated by the question of the expropriated Standard Oil properties, for which no adjustment had been made, although in other respects relations with the United States were on a cordial basis, centring especially around problems of hemispheric defense. The United States succeeded in concluding a tungsten purchase agreement with Bolivia in 1941, despite a Japanese offer of a considerably higher unit price. After the Japanese attack on Pearl Harbor, Bolivia manifested strong official support for the United States position. In the preceding month a U.S. air mission had succeeded an Italian mission in directing the training of the Bolivian air force; the latter consisted of only some 60 planes, however.

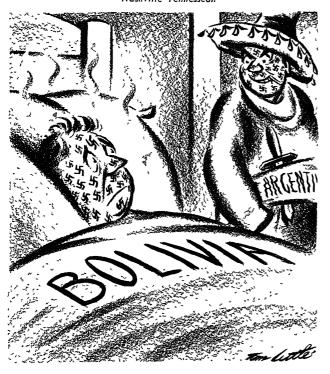

Meanwhile, on the domestic scene, miners demanded a 100% wage increase and by Dec. 14, 1942, had become so vociferous in their demands that a nationwide state of siege was decreed. The labour demands centred in the employees of the Patiño Mining company. The government's arbitrary actions in response to the demands led to the so-called Catavi massacre in December in which considerable numbers, variously estimated from 20 to 100, of miners and their wives and children were killed. Three alleged leaders of a reputed plot to overthrow the government were simultaneously arrested. The Catavi tragedy greatly antagonized the Bolivian people, thereby contributing to the growing unpopularity of the Peñaranda regime, and also had serious repercussions abroad. A semiofficial mission went from the United States to investigate the affair. When President Peñaranda visited the United States in 1943, the then chief of the labour office of the Pan American Union, Ernesto Galarza, addressed an open letter to Sumner Welles, the acting secretary of state, in which he strongly denounced the "crimes" committed against Bolivian workers.

The increasing tempo of the U.S. armament program resulted in a price increase for tin and tungsten in July 1942 and an agreement to purchase a greater annual tonnage of the two metals. The following month a Bolivian economic mission which had been invited to Washington announced at La Paz the creation of a Bolivian Development corporation as an affiliate of the Inter-American Development corporation. It was also announced that \$25,000,000 of U.S. funds would be advanced to Bolivia to be devoted to construction of 4 major highways, the establishment of a national sugar industry, the stimulation of petroleum production, the creation of a currency stabilization fund and the financing of imports from the United States. The Bolivian congress, aroused by the alleged shortcomings of the August agreement with the United States, forced the resignation of the cabinet in Nov. 1942. Soon afterward, but by a margin of only 1 vote, the congress gave its formal approval to the settlement reached earlier in 1942 by which the government agreed to pay approximately \$1,750,000 for the properties expropriated from the Standard Oil company in 1937. A further development affecting relations with the United States in 1942 was the agreement in August for the sending of a four-year military mission to direct the organization and training of the Bolivian army; the prewar influence in Bolivian military development had been primarily German. Argentina in Sept. 1942 began construction of a railway link connecting that country with Santa Cruz in the heart of the Bolivian oil fields. The line, it was thought in some quarters, was intended in part to preserve Argentine influence in competition with the transcontinental railway under construction from Arica, Chile, to Santos, Brazıl, which would help to cement economic ties between Bolivia and Brazil.

Bolivia in 1943 became the 2nd South American (and the 12th Latin-American) nation to declare was on any of the axis powers. The action was taken on April 7 while Vice-President Henry A. Wallace of the United States was in the country on an official visit. Opponents of the government charged that the step was taken merely to simplify harsh governmental control over the country. Bolivian labourers had already been registered and had been given conscript status so that essential work in the mines and in agricultural enterprises would not suffer because of loss of trained men to the army. Professional men were similarly listed in May. The same month saw establishment of censorship over all means of communication. President Peñaranda made an official visit to the United States early in May 1943 further to integrate the Bolivian effort with the war program. The U.S. government, soon after Peñaranda's arrival, announced that economic co-operation between the two countries would be intensified. President Roosevelt also apologized for the "excessive" rates charged Bolivia by U.S. bankers during the 1920s. Bolivia on June 28, 1943, reached a friendly agreement with Brazil for the exchange of raw materials, but the same year saw a somewhat strained interchange of comments with Chile over the long-lived question of a Bolivian outlet to the Pacific.

Domestic conditions continued troubled throughout 1943, chiefly because of the controversy inherited from the Catavi disaster of Dec. 1942. The joint Bolivian-U.S. commission which investigated conditions in the tin mines recommended certain reforms in working conditions, but the Peñaranda administration continued to be the subject of bitter attacks for its labour policy. Opposition came both from the Movimiento Nacional Revolucionario (M.N.R.), a strongly nationalistic party, and the Partido

"The Plague Spreads," a reference to Argentina's alleged role in the Bolivian revolution of Dec. 1943. Cartoon by Tom Little of the Nashville Tennessean

Izquierdo Revolucionario, a leftist political group. The two were not allied with one another and displayed a mutually suspicious and hostile attitude but made common cause in attacking the government. Their opposition resulted in the growth of a united revolutionary sentiment among the exploited working classes and brought about the resignation of the cabinet in Sept. 1943.

The Villarroel Regime.—The critical internal political situation came to a climax in a well-planned revolution by the M.N.R. led by Víctor Paz Estenssoro on Dec. 20, 1943. The movement was quickly successful, Peñaranda was promptly exiled and a new government was set up under Major Gualberto Villarroel. Domestic political opponents of the new regime and many foreign observers immediately charged it with nazi sympathies, especially in view of the cordial attitude manifested toward it by the military clique in power in Argentina.

The Committee for the Political Defense of the Hemisphere, a creation of the third foreign ministers' conference at Rio de Janeiro, Brazil, in Jan. 1942, resolved at Montevideo, Uruguay, on Dec. 24, 1943, that the republics of the Americas ought not to extend recognition to any new government set up by force until after mutual consultation. Bolivia was not mentioned by name in the resolution but the coup at La Paz was the obvious inspiration for the step. Although the new government announced that it would live up to all Bolivian commitments to the United Nations, the United States, along with most of the rest of the republics of the hemisphere, withheld recognition, in view of the action of the C.P.D. at Montevideo and because of the previous pro-nazi associations of several of the leaders of the revolution. Among the few hemispheric governments which did extend recognition was Argentina, which took the step on Jan. 3, 1944.

The principal problem in 1944 was the gaining of stability by diplomatic recognition of the new regime. Inter-American consultations were actively held during the early weeks of the year and resulted in crystallization of a nonrecognition policy adhered to by most of the governments of the hemisphere. The charge of Argentine inspiration for the December coup continued to be actively made in the early part of 1944. Bolivia sent Undersecretary Fernando Iturralde Chinel to the United States to try to win governmental favour, but without success. At the end of January, U.S. Ambassador Pierre Boal, who had been charged with failure to report any of the developing symptoms prior to the coup of Dec. 20, was called to Washington for consultation. Bolivia on Feb. 11, 1944, made three cabinet changes in an effort to convince the other American governments that it was not under German or Argentine influence. Expropriation of axis-operated firms was decreed on Feb. 12. The government on March 21 decreed elections for a national constituent and legislative assembly to be held July 2; the assembly was to meet Aug. 6 and elect a constitutional president. The United States early in May sent Avra M. Warren, ambassador to Panama, and Gen. Ralph Wooten, commander of the 6th U.S. air force, to La Paz to study the political situation. Warren returned to Washington on May 26 and on the basis of his report of a purge of nazi influences and following additional inter-American discussions, the United States, Great Britain and the Latin American states extended diplomatic recognition on June 23, 1944.

Víctor Paz Estenssoro had resigned as finance minister on April 2, 1944. On April 28 the government announced discovery of a "vast revolutionary plot" and proclaimed a

state of siege but declared it would not interfere with the July elections. Those elections gave strong majorities to administration candidates, the combined opposition gaining only 21 seats. A week later, July 9, José Antonio Arze, R.I.R. leader, was shot and seriously wounded. Mauricio Hochschild, wealthy tin magnate, who had been accused of complicity in an abortive revolt in April, was missing (allegedly kidnapped) early in August and after his return to La Paz he went to Chile and subsequently to the United States. (An army officer, member of a military lodge supporting Villarroel, confessed on July 27, 1946, that he and fellow officers had kidnapped Hochschild.) The constituent assembly on Aug. 6, 1944, elected Villarroel constitutional president by 79 votes against 10 for 3 opponents. The government on Nov. 19 announced discovery of a revolutionary plot at Oruro, suppressed it with several executions and ruled thereafter with an even heavier hand.

Political conditions continued disturbed, with repeated charges of repression, during much of 1945. Bodies of two opposition senators who had been missing since the unsuccessful revolution in Nov. 1944 were found in a mountain gorge near La Paz on Jan. 25, 1945; it was charged that they had been killed by the government. An unsuccessful attempt was made on March 12 to assassinate President Villarroel. Exiled Bolivians organized at Santiago, Chile, in mid-June, a Frente Democrático Boliviano with Dr. Fernando Guachalla, former ambassador to the United States, as head; the chief of the groups composing it was the long-outlawed P.I.R. headed by the exiled Senator José Antonio Arze. In the foreign theatre, Minister Gustavo Chacón announced on March 19 that relations with the U.S.S.R. would be established. The government on Sept. 28 ended diplomatic relations with the Franco regime in Spain. The earlier months of 1946 were characterized by continued chronic disorder. A general strike of mine workers set for Feb. 5, 1946, in protest against a decision of the labour court regarding dismissal pay was called off only when the supreme court reversed the lower court's decision. Censorship was imposed April 30 after discovery of an alleged plot to prevent the holding of congressional elections scheduled for May 5. The elections in May increased the strength of the M.N.R. to 13 out of 27 in the senate and 71 out of 111 in the chamber of deputies. A state of siege was imposed May 30 and oppositionists charged that the government had begun a veritable reign of terror. A railway strike of several days' duration began June 3. An abortive army air force revolt occurred June 13. The government on June 19 seized two prominent La Paz newspapers as "organs of sedition."

Assassination of Villarroel.—The final and most serious revolutionary movement began at La Paz on July 18, 1946. Two days of bloody street fighting followed, in which rebels seized the municipal hall and traffic headquarters and with weapons captured in those buildings stormed the central jail and liberated political prisoners.

President Villarroel on July 20 appointed an entirely military cabinet and took futile steps to try to arrange his escape by plane. The following day, July 21, rebels stormed the presidential palace and hurled Villarroel from a balcony to the street, where angry mobs stripped his body and hanged it twice from a lamppost. An estimated 260 persons were killed and 520 wounded in the revolution. The provisional government, which even during the fighting attempted to organize student groups for preservation of order, assumed vigorous control of the situation.

The new regime was headed temporarily by Nestor Guillén, dean of the La Paz district of the superior court; it promised a restoration of civil liberties, the holding of free elections, a political amnesty, lifting of censorship and the punishment of other officials of the Villarroel regime. On July 23 it further pledged to abide by the constitution and Bolivia's international obligations; labour groups on the same day endorsed the new government. It was decreed on July 24 that army officers might not hold

civil offices; early in August, 41 prominent army officers were dismissed. Tomás Monje Gutiérrez, president of the Bolivian superior court, assumed the provisional presidency on Aug. 16 succeeding Guillén; both were members of the revolutionary junta. The new regime was engaged for some weeks after the July revolution in consolidating its position. (R. H. Fn.)

Bolivia at Decade's End.—The antagonism between the civil and the military, as a consequence of the July revolution, developed to such a point that for some time many civilians could not endure the military uniform. It was probably a pedagogical question, left for time, whether the military element would return to enjoy a better position in public opinion. It was for that reason that an attempt was being made to reorganize the army, creating a new force which would know how to fill its specific function by devoting itself to the defense of territorial integrity and to the safeguarding of domestic public order.

The public had not yet arrived at differentiating good from bad military men; the latter had filled the military institution with ignominy, creating military lodges to extort everything from the nation, and constituting a privileged caste.

Almost in the last stages of the Villarroel regime, some national representative in the chamber of deputies had impugned the conduct of the army which, leaving its orbit of action, had usuiped the governmental function. Assuming the representation of the army, the minister of defense at that time challenged one deputy to a duel because he felt that such criticism, though moderate and just, constituted an offense to the army.

With the junta at the end of its journey, pledged to constitutionalize the country by means of an electoral plebiscite on Jan. 5, 1947, the government hoped that a new army would be reborn out of its own ashes, so that it could become again the pride of a nation. (T. Gz.)

Bombay

Capital of Bombay presidency, the city of Bombay stands at the southern end of Bombay island, 18° 55′ N., 72° 54′ E. Statistics best illustrated the growth of the city of Bombay in the decade 1937–46. The population increased from 1,161,380 to 2,500,000, the expenditure on primary education by the municipality from Rs.3,346,190 to Rs.5,341,151, the expenditure on medical relief from Rs.1,796,733 to Rs.2,414,403 and the road mileage from 51.67 mi. to 264.7 mi.

The Greater Bombay scheme, which implied the extension of the city limits and its planned development, was inaugurated in Oct. 1945 and expanded the area covered by the city from 16,761 ac. to 28,160 ac. A master plan for Greater Bombay was being prepared by experts. It contemplated the ultimate extension of the area to accommodate a population of 4,000,000, and would take in the island of Trombay and the neighbouring town of Ambarnath, the latter for the location of heavy industries.

The cotton textile industry was Bombay's leading industry. In 1936, 74 mills employed 109,760 operatives, and produced 1,236,204,871 yd. of cloth. In 1945, 65 mills in the city employed 129,510 operatives and produced 1,649,701,235 yd. of cloth. The share value of the textile mills in Bombay was approximately Rs.130,000,000. The slow rate of expansion was in the opinion of experts caused by the fact that the optimum had been reached. There was a

tendency for the industry, formerly localized in Bombay and Ahmedabad, to become decentralized. In the whole of India there were 407 textile mills employing 505,506 operatives. The number of other workshops and factories in Bombay, ranging from small establishments with a dozen hands to those daily engaging thousands of operatives, rose from 970 in 1936 to 1,130 in 1945. In 1945, 22% of the entire population of the city was engaged in industry compared with 26% in 1936. Bombay was an important disembarkation point during World War II and on Aug. 14, 1944, it was shaken by a disastrous explosion when a vessel containing 1,320 tons of high explosive blew up in Victoria dock, causing extensive damage to shipping and harbour installations.

Grave disorders followed the arrest of Congress leaders in Aug. 1942, and in Feb. 1945 there was a short-lived mutiny among the naval units in Bombay harbour. During the closing months of 1946 communal rioting broke out in the city on many occasions, following the proclamation of "direct action day" by the Moslem league.

Bonnet, Georges

Bonnet (1889—), French politician, was born in Bassilac (Dordogne). Son of an appellate judge, he studied law, becoming a privy council probationer in 1912. During World War I he served in the French army first as a sergeant and later a lieutenant and was awarded the Croix de Guerre. A Radical Socialist, Bonnet participated in the establishment of the League of Nations and represented France at the Geneva conference in 1922. He was elected deputy for Dordogne department in 1924, lost his seat in 1928 and was re-elected the following year in a by-election. He was minister of finance and head of the French delegation to the London Economic conference in 1933, minister of commerce in 1935, and ambassador to Washington, D.C., in 1937.

In April 1938, Bonnet became foreign minister. One of the principal architects of the Munich agreement, Bonnet exercised pressure on Czechoslovakia to agree to Anglo-French proposals for cession of the Sudetenland in the "interests of peace." When the Germans annexed Bohemia and Moravia, March 15, 1939, in violation of the Munich pact, Bonnet contended that as the agreement had not yet become "effective," France was not bound to help Czechoslovakia out of its difficulties. Ten days after the start of World War II, Edouard Daladier transferred Bonnet from the foreign ministry to the justice ministry. After the fall of France in 1940, he slipped into obscurity until June 1944, when the French Radical Socialists meeting in Algiers announced his expulsion from the party. A Paris dispatch of Nov. 23, 1944, said that Bonnet had been arrested on charges of handing over planes of the Air France company to the Germans.

Bono, Emilio Giuseppe Gaspare Giovanni de

De Bono (1866-1944), Italian army officer and fascist official, was born March 19, 1866, at Cassano d'Adda. He helped organize the fascist militia, and also handled the technical and military aspects of Benito Mussolini's march on Rome in 1922. De Bono was rewarded by the duce with the governorship of Tripolitania in 1925. In Jan. 1935, Mussolini named De Bono high commissioner for Italy's East African colonies and made him commander of the Italian armies that invaded Ethiopia from Eritrea. De Bono, however, had little ability as a general and was replaced by Marshal Pietro Badoglio, who brought the campaign to a successful conclusion. When Mussolini's regime floundered after the loss of North Africa and Sicily in 1943, De Bono was reported to have been among those highly placed fascist leaders who advocated the duce's ouster and an early peace with the Allies. He was arrested by axis authorities, was tried and found guilty of plotting Mussolini's overthrow, and, together with Count Galeazzo Ciano and other fascist "traitors," was executed by a firing squad at Verona, Jan. 11, 1944.

Bonomi, Ivanoe

Bonomi (1873—), Italian statesman, was born in Mantua. An early Socialist, he was managing editor of the famous Italian Socialist newspaper, *Avanti*, and was succeeded in this post by Benito Mussolini, then also a Socialist, in 1912. Bonomi, who was a member of the chamber of deputies from 1911 to 1924, became premier in July 1921 of a leftist coalition government. His tenure was brief, and disorders provoked by Mussolini's fascisti resulted in the downfall of his government in Feb. 1922. He left politics in 1924 to resume his law practice.

After Pietro Badoglio's resignation June 9, 1944, Bonomi again formed a coalition government. However, political cleavages soon emerged in the six major Italian political parties represented in his cabinet. This factor, added to Italy's economic difficulties, compelled his government to resign on Nov. 26, 1944. Asked to form a new government, he sought to appoint Count Carlo Sforza, an avowed antimonarchist, as foreign minister. This suggestion was flatly vetoed by Winston Churchill and Anthony Eden, and Bonomi formed a cabinet on Dec. 10, 1944, without Sforza. The Sforza incident, however, clearly demonstrated that real power in governing the affairs of Italy was exercised by the Allied military government. On June 12, 1945, the Bonomi government resigned. On March 31, 1946, Bonomi forsook his socialism and together with Vittorio Orlando and Francesco Nitti, both former premiers, created the new rightist Democratic Union party.

Book-Collecting and Book Prices

It may well be that the decade 1937–46 will go down in book-collecting history as the era of skepticism. Or, if it does not achieve description so definitive, none can doubt that it was a period of scholarly, often scientific, reexamination. To understand the decade best, it is necessary to go back to July 2, 1934, on which day was published simultaneously in London and New York An Enquiry into the Nature of Certain Nineteenth Century Pamphlets, an

erudite and highly readable work of bibliographical detection by two English bookmen, John Carter and Graham Pollard. The Enquiry was the crystallization of vague rumour and suspicion regarding the authenticity of certain alleged first editions of Matthew Arnold, Elizabeth Barrett Browning, Robert Browning, Charles Dickens, Rudyard Kipling, Robert Louis Stevenson, Algernon Charles Swinburne, Alfred, Lord Tennyson, William Makepeace Thackeray and others. At no time, prior to publication of the Enquiry were these suspicions general nor, for that matter, were they known to the majority of booksellers, collectors and scholars. For 30 years these slim productions were considered desirable collector's items and were accepted for what they pretended to be: privately printed productions of their authors. Most notable among these fabrications was the alleged privately printed first edition of Elizabeth Barrett Browning's Sonnets [from the Portuguese] which the fabricator foisted on the world as having been issued by Robert Browning, at Reading, in 1847. In 1930 a copy of the fabrication fetched \$1,250 at public auction, fair indication of the fabricator's success. The Enquiry indicated that Thomas J. Wise, famed bibliographer, was responsible for the fabrication. Wise, who died in 1937, did not present an effective rebuttal.

Publication of the Enquiry startled both the United States and Great Britain. One may express surprise, however, that the exposure was so long in coming. As early as 1910, Alfred William Pollard, a noted bibliographer and one time assistant keeper of printed books at the British museum, had written (in the Encyclopædia Britannica, 11th edition): "A special case of . . . spurious imprints is that of the modern photographic or type-facsimile forgery of small books possessing a high commercial value. . . . The type-facsimile forgeries are mostly of short pieces by Tennyson, George Eliot and A. C. Swinburne, printed (or supposed to have been printed—for it is doubtful if some of these 'forgeries' ever had any originals) for circulation among friends. These trifles should never be purchased without a written guarantee."

The Enquiry seems to have established a frame of mind which persisted throughout the decade. Directly inspired by it was a parallel study by Wilfred Partington, Forging Ahead: The True Story of ... Thomas James Wise (New York, 1939); and Fannie E. Ratchford's Letters of Thomas James Wise to John Henry Wrenn: Further Inquiry into the Guilt of the 19th Century Forgeries (New York, 1944). Miss Ratchford attempted to implicate Edmund Gosse and bibliophile H. Buxton Forman with Wise. Still later contributions on this same subject were published by Miss Ratchford and by Roland Baughmann, exposing, respectively, the fraudulent nature of the London, 1864 (sic) edition of Tennyson's Idylls of the Hearth and the Rugby [1864] (sic) edition of Matthew Arnold's Alaric at Rome.

Other exposures followed: Professor Robert M. Smith of Lehigh university, in collaboration with others, produced The Shelley Legend (New York, 1945) which exposed as forgeries a number of alleged Percy Bysshe Shelley letters and manuscripts which had been accepted by many biographers and bibliographers for 75 years. Professor Smith and his colleagues contended that certain members of the Shelley family, the chief perpetrators and instigators of these forgeries, had committed not only a sin against the collector but had perpetuated a mythical Shelley that the facts could not support. Similarly, A Bibliography of the Strawberry Hill Press, by A. T. Hazen and J. P. Kirby (New Haven, 1942), primarily a bibliography of Horace Walpole's printed publications, demonstrated beyond any doubt that certain large paper editions of

Walpole, which had been accepted as first editions, were, in fact, unauthorized printings produced after Walpole's death in 1797.

The critical attitude was not restricted to material offered for sale. American auction catalogues came in for a share of criticism which reached its vocal height in David A. Randall's "A Plea for a More Consistent Policy of Cataloguing by Auction Galleries," a paper delivered at a meeting of the Bibliographical Society of America (Jan. 18, 1946) and subsequently printed in the society's Papers (volume 40, second quarter, 1946). Criticism of American auction catalogues had been common among bookmen and on occasion was discussed in Publisher's Weekly (New York) and at greater and stronger length in the (London) Times Literary Supplement. Critical comparison of U.S. and British auction cataloguing centred on the fact that in Great Britain, the auction catalogues were addressed to the professional dealer (presumed to know exactly what is offered for sale); while in the United States the auction catalogues were designed primarily for the unprofessional collector. The principal criticism of American auction houses was their disposition to use descriptions which, according to the critics, often were verbose, inaccurate or not based on the best available information.

During the decade, the collecting base was broadened to put greater emphasis on, for example, not only belleslettres or the productions of fine presses, but on specific subjects, such as the first appearances in print of familiar quotations and poems; local imprints; medical material, philosophy, economics, etc. Collectors also broke away from the impossibly perfectionist standard of the 1920s when it was not uncommon for a collector to refuse a book because of some minor defect or the lack of a dust wrapper. Collectors more generally recognized that an 18th century book, for example, was completely collectable even though it lacked a half-title or a blank leaf; that bibliographic perfection was not always attainable.

Auctions.—The decade saw a major change in book auctions, with the United States taking a commanding lead. The British sale season of 1936–37 was one of the most successful in years, but the situation was somewhat reversed by 1939. When World War II broke out in Sept. 1939, the London book auction rooms considered the advisability of suspending operations for the duration but, after a brief interlude of hesitation, commenced sales in Nov. 1939. As the war progressed and the British trade discovered that it was possible, after a fashion, to maintain some degree of normal trade, auctions were held with fair regularity.

While British auction houses were struggling to maintain themselves under wartime conditions, American auction houses were deluged with thousands of items. So great was the increase in the auction trade that it was possible for several smaller houses to establish themselves in New York and elsewhere in the United States and to dispose of large quantities of lower priced material. On occasion, even these smaller houses dispersed collections of not unrespectable bibliophilic worth. After a series of incidents, the famed New York auction house, American Art Association-Anderson galleries, went out of business. A group of former employees established, in New York, the Parke-Bernet galleries which rose rapidly to prominence and became the world's leading auction house.

The period immediately preceding Pearl Harbor saw a cautious attitude on the part of American consignors, to auction which was reflected in sales of comparatively small importance. As profits increased with wartime production, the situation changed and book auctions, paced

by industry, rose to record-breaking heights. Among the more notable sales held in the United States were those of the library of Cortlandt Field Bishop, one-time owner of American Art Association-Anderson galleries and the collection of William Randolph Hearst; both sales were held in 1938. In 1939, the only sale of lasting note was the natural history collection assembled by Ormond G. Smith; in 1940, the principal American sale was of the library of John Gribbel; the library of William H. Woodin, sold in 1941, was that year's outstanding sale (the final portions of the collection were dispersed in 1943). In 1941, the Parke-Bernet galleries sold the library of A. Edward Newton, Dickensian and globe-trotting author of several books on the joys of book-collecting. The year 1944 was not notable insofar as book auctions were concerned, although it saw dispersal of the James McHenry Papers, the second and final part of the collection being sold in 1945. Principal American sale of English and American literature during the ten-year period was that of the library of Frank I. Hogan, one-time president of the American Bar association and collector extraordinary. The Hogan library, sold during the years 1945-46, cost its collector an estimated \$750,-000; the sale fetched a total of slightly under \$500,000. Among the great books that passed from the Hogan library to other buyers: a first edition of The Pilgrim's Progress, a "made-up" but nevertheless highly desirable copy (\$8,000); a copy, lacking 77 leaves, of the first edition of Chaucer's Canterbury Tales (\$13,000); a manuscript of the nursery rhyme, Old Mother Hubbard (\$3,250); the Manley-Rosebery First Folio of Shakespeare (\$50,000). In 1946, the auction season was further highlighted by the sale of the Eldridge R. Johnson collection which contained, among other treasures, the original manuscript of Lewis Carroll's Alice's Adventures Underground, subsequently printed under the title as we now know it, Alice's Adventures in Wonderland; it realized \$50,000.

Auction sales in Great Britain were not spectacular save in the matter of prices which were, in some cases, excessively high. American buyers found it virtually impossible to buy at public auction for this reason and their principal purchases were by private treaty with British dealers. Transatlantic shipments presented another trade problem, although only one recorded book shipment was lost at sea during World War II.

Bookselling in Great Britain was restricted by wartime regulations. In 1940, in an effort to prevent the flight of capital, the government imposed regulations which permitted the export of rare books and manuscripts by licence only. The method proved so onerous, and was in fact so unworkable, that the restriction was revised to apply to books and manuscripts only if they were over 75 years old or valued at more than £50. At the very beginning it was evident that the restrictions could be used by the government to prevent removal from the country of literary property which might be considered national treasure; it was not until April 1944, however, when this phase was discussed in the house of commons, that this aspect became official.

The restrictions created an anomaly: Great Britain was straining every effort to build up foreign credits in the United States, its most logical market for literary property; but at the same time Great Britain wished to control what might have become a serious draining of its cultural resources. However, there were few instances in which material was not permitted to leave the country. The restrictions which prevented the flow of capital from Great Brit-

ain also effectively prevented British dealers and collectors from purchasing rare books and manuscripts abroad save by devious methods which were seldom practised and never condoned. In the summer of 1946, however, following the grant of a loan from the United States to Great Britain, the barrier was partially removed when the Import Licensing department of the Board of Trade promulgated a set of rules and restrictions which permitted the importation of rare books and manuscripts into Great Britain under a licensing system.

During the decade prices rose, reaching inflationary heights. This condition, in both the United States and Great Britain, mostly affected books in the lower price brackets, with those in the higher levels showing small, if any, advances. The inflationary condition was caused, in part, by a lack of consumer goods which thus brought quantities of loose money into the market, combined with an influx of inexperienced collectors who, believing that rare books presented a hedge against inflation, bought not wisely but too well. Publishers' Weekly, the American book trade journal, on several occasions decried what it called "uninformed buying" while the (London) Times Literary Supplement time and again published sober strictures on the practice. As one example of many, a copy of the Kelmscott Chaucer, in the London auctions of 1944, brought £205, about twice what the book had brought at normal auction only three years before.

With virtually the whole of Europe in nazi hands, the continental book trade was in a vacuum. Many dealers in Paris and other centres overrun by the invaders sold their stocks to the nazis at the conquerors' own price or had their stock "requisitioned," although certain of the more astute dealers hid their choicest material pending the war's end. After the defeat of Germany, dealers revisited European book centres. It was found that in France book auctions had all but disappeared since they were a matter of public record and hence furnished the tax-gatherers with information that certain operators preferred to keep to themselves. As late as 1946, many of France's once outstanding shops were practically bare but there were, curiously enough, more book shops operating after the war than before. Switzerland, always dependent on Germany for rare books, was practically out of the business; while Italy was in a state of commercial chaos with the book business resembling that of Germany during the inflation that followed World War I. Throughout the continent the book business was on an under-the-counter basis with pre-

An impromptu book shop set up in the open air among the ruins of Warsaw

vailing black market prices for commodities controlling prices on the few good books available. .

Shortly before the war and during its early period, certain of the continental booksellers escaped the nazis and established themselves in the United States. Some were able to bring with them fair stocks of rare books and thus continued in business. Most of these *émigrés* established themselves in New York city, where they soon found a place in American bookselling.

Bibliographies.—Bibliographical activity, as indicated by published works, was high in both quantity and quality. In the United States the largest bibliography, in terms of persons employed, was the Federal Imprints Inventory, compiled under the supervision of the Works Progress administration. Thousands of otherwise unemployed workers throughout the nation were engaged in the task of listing books and other publications according to place of publication and date. With the coming of the war years and the consequent return of these technically unemployed persons to other employment, the Bibliographical Society of America, with funds provided by the Rockefeller foundation, commenced preparation of the notes for final publication. The Inventory had issued, but had not published, a number of the lists in mimeograph manuscript form for use in preparing a manuscript for publication. In 1944, also under the supervision of the Bibliographical Society of America, a bibliography of American literature designed to cover the period 1787-1930 was started. It was made possible by a grant from the Lilly endowment and was under the editorial supervision of Jacob Blanck; publication of the finished bibliography was planned for 1955.

Bibliographical activity in Great Britain was severely curtailed by the war. The most important works issued were: The Cambridge Bibliography of English Literature, edited by F. W. Bateson (New York and Cambridge, 1941), 4 vols.; and The Oxford Companion to American Literature, by James D. Hart (Oxford University Press, 1941). As an example of the severity of wartime restrictions, the Bibliographical society was unable to issue its 50th anniversary publication until 1945, 3 years after the society's anniversary year. The publication was The Bibliographical Society, 1892-1942. Studies in Retrospect (Bibliographical society, London, 1945). But there was every indication that Great Britain would, after removal of restrictions, again resume publication of bibliographical works. In the fall of 1946, the Bibliographical society announced that A Short-Title Catalogue of Books Printed in England, Scotland, and Ireland and of English Books Printed Abroad, 1475-1640, compiled by A. W. Pollard and G. R. Redgrave, would be re-issued. The first edition, 1926, had been long out of print, and the reprint edition was eagerly waited by bookmen throughout the world. The society also announced that work on a revision of the book was going forward.

Bibliographical publications in the United States were many. Among the most important were: A Bibliography of John Greenleaf Whittier, by Thomas Franklin Currier (Harvard University Press, 1937); Tobacco, its History Illustrated by the Books . . . in the Library of George Arents, Jr., by Jerome E. Brooks (New York, the Rosenbach company, 1938–43), 4 vols.; American Fiction, 1774–1850, by Lyle H. Wright (San Marino, the Huntington library, 1939); Cotton Mather, a Bibliography of His Works and The Minor Mathers, a List of Their Works, both by Thomas J. Holmes (Harvard University Press, 1940); Incunabula in American Libraries, by Margaret Bingham Stillwell (New York, The Bibliographical Society of Amer-

ica, 1940), which, incidentally, showed an increase of about 200% in American holdings in incunabula over the earlier census of 1919; The Carl H. Pforzheimer Library of English Literature, 1475-1700, by William A. Jackson (New York, privately printed, 1940), 3 vols.; A Bibliography of the Strawberry Hill Press . . ., by A. T. Hazen (New Haven, Yale University Press, 1942), see above; A Bibliography of James Whitcomb Riley, by Anthony J. and Dorothy R. Russo (Indianapolis, the Indiana Historical society, 1944); Short Title Catalogue of Books Printed in England, Scotland, Ireland, Wales, and British America and of English Books Printed in Other Countries, 1641-1700, by Donald Wing (printed for the Index society by Columbia University Press, New York, 1945), vol. 1 of a projected threevolume set; The Cambridge Press 1638-1692. A Re-examination . . ., by George Parker Winship (Philadelphia, University of Pennsylvania, 1945). The long-delayed bibliography of early American newspapers, by Clarence S. Brigham, finally went to press in 1946. (J. Bk.)

Book Publishing

Though there was not yet a full economic recovery in the United States in 1937, the worst phase of the depression was over. Book production was rising both in the total number of volumes manufactured and in the number of titles listed. Business casualties in publishing, during the decade 1937–46, were few and included only one old established house—the reprint company A. L. Burt. They were more than counterbalanced by important new firms, among them Duell, Sloan and Pearce and Smith and Durrell (1939); Howell Soskin (1940); Creative Age Press (1941); Roy, established by émigré Polish publishers, and Pantheon, specializing in art books (1942); and William Sloane Associates, A. A. Wynn and Boni and Gaer, all in 1946.

In addition, as testimony to the stability of U.S. book publishing, 4 publishers and a wholesale distributor celebrated their 100th anniversaries during the decade, joining some 20 other houses that had become centenarians carlier. The five included Little, Brown; Dodd Mead; Putnam's; the educational publishers A. S. Barnes; and the wholesalers A. C. McClurg of Chicago.

U.S. Book Production (Number of Titles)

			Y	eai	•					New Titles	New Editions	Total
1937										9,273	1,639	10,912
1938		٠								9,464	1,603	11,067
1939										9,025	1,625	10,650
1940										9,515	1,813	11,328
1941										9,337	1,775	11,112
1942										7,786	1,739	9,525
1943										6,764	1,561	8,325
1944										5,807	1,163	6,970
1945	-	·								5,386	1,162	6,548
1946			•				•	•	٠	6,170	1,565	7,735

Another sign of the vitality of the U.S. publishing industry was the success achieved in this period in the drive toward mass markets. The gains were made chiefly through two new publishing developments, the book clubs and the 25-cent paper-bound book.

Book Clubs.—Following the success of the Book of the Month club, many other clubs, appealing to every level of age and taste and every range of interest, had been established. Among these the depression casualties were heavy. Those that weathered the storm were joined by a new group that included the Heritage club (1937), Book Find club and Classics club (1941), Peoples' Book club (1943), Dollar Book club (1944), Junior Heritage club (1945) and Teen Age club, Negro Book club, Non-Fiction Book club, and Executives' club, all in 1946.

Of the new clubs, the Book Find club was notable for

the fact that it was launched without capital and won its following by a policy of selecting unusual books that might otherwise have been neglected. The Peoples' Book club, a subsidiary of Simon and Schuster, used two innovations in its operations: its selections were made by the membership through a poll conducted by the Gallup institute; and its distribution was linked with the mail-order house of Sears Roebuck and Co. A similar link was established by another club, the Literary guild, with the mail-order house of Montgomery Ward.

Book club membership during the decade rose to more than 3,000,000, one club alone topping the 1,000,000 mark. The two largest clubs circulated 500,000 copies, or more, of each of their selections. Through this they had become the dominant influence in the making of best sellers.

According to the findings in the survey, *People and Books*, issued in 1946, book clubs accounted for 22% of total book purchases. This, however, represented largely a net increase in book circulation, since a considerable proportion of book club membership was located in communities of less than 100,000 population, not served by book stores.

The Paper-Bound Book.—The 25-cent paper-bound book, which established itself during the decade 1937-46, made even more remarkable strides. The pioneers were the Red Seal editions issued by Modern Age in 1937 and the Penguins which, in the same year, moved from England, where they had proved a great success.

The first series to achieve mass distribution, however, was Pocket Books, a subsidiary of Simon and Schuster. A stream of other paper-bound book series followed. Among the most active were Bantam Books, organized by a publishing group consisting of the old established reprint house, Grossett and Dunlap, and the Curtis Publishing Co., magazine publishers who decided to tie in with, rather than resist, the trend to the paper-bound book. In 1946 the Penguins achieved mass distribution through a connection with the Fawcett publications, a magazine chain which, like Curtis, decided to go with the paper-book trend.

Price Protection.—Two things made the success of the paper-bound book possible. One was a technical innovation, the economical new "perfect binding" which, by use of flexible glue, eliminated stitching and other binding operations. The other was the final victory of the book trade in achieving stable pricing. This was particularly vital to the 25-cent book with its low price margin.

Booksellers' and publishers' organizations had campaigned from the beginning of the century against price cutting, especially in department stores, which frequently used books as "loss-leaders." In 1937 came the decisive legal test when Fair Trade legislation, involving price protection provisions, was upheld in the supreme court. This forced the New York state court of appeals to reverse itself in a decision it had formerly rendered in favour of the Macy department store against the Doubleday publishing company. The price-protection legislation was rendered complete, in the same year, with the passage through congress of the Miller-Tydings bill, exempting fair-trade contracts from the provisions of the Sherman Antitrust act.

Books with Other Media.—As the circulation and prestige of books increased, there was a corresponding increase in the interdependence of books and other entertainment media. Thus, newspapers and magazines found book reviews an increasingly popular feature. The Chicago Trib-

une and The Chicago Sun, the Philadelphia Inquirer and other important papers added book review supplements as separate magazine features. New daily book columns by name reviewers, such as those of Sterling North and Orville Prescott, were added; and author interviews such as those by Clip Boutell and Charles Poore became popular. Book sections in magazines grew at a similar rate; and the digest magazines, including Readers' Digest, featured book condensations.

There was a time when it was supposed that the film industry would develop independent script-writing talent and story sources of its own. The contrary happened during the decade. Writers of books continued to be brought to Hollywood as script writers, and books continued to be a main source of feature films. Perhaps the chief reason was that books came to the screen with a prestige considered well worth the large sums paid for them in promotional value. Every book sold could count upon a minimum of four other readers. At least five people, therefore, had displayed it and talked about it. Reviews had appeared in a hundred or more media with a potential circulation starting at 10,000,000. And if it had been even moderately successful, word of it had also reached millions through radio review and discussion. The advantages were reciprocal, for the filming of a book brought it enormous added sales in the reprint editions. Recognizing this promotional value, film companies offered prizes to new talents, through publishing houses-awards that in one instance topped \$100,000.

During the decade radio too became "book conscious." Like the films, it drew more and more upon book writers for its scripts. Book review programs on local stations, with local book reviewers conducting them, joined national programs. Radio commentators, even of the "hard-boiled" type like Walter Winchell, included references to current books in their comment or items about authors in their gossip.

"Information Please" and other quiz programs drew heavily upon book knowledge. Book Forum programs such as "Author Meets Critic" and "Books on Trial" showed high popularity ratings, as did "Invitation to Learning," which discussed classics.

Prizes and Fellowships.-Prize awards, already mentioned in book-film collaboration, were an interesting development of the decade. Already established prizes like the Nobel and Pulitzer prizes, the Harper prize and the Newbery Medal award for children's books gained added importance in this period, almost rivalling book-club selections in their influence on best seller lists. The publishers, E. P. Dutton and Whittlesey House, offered prizes to stimulate books of regional interest; Little, Brown and Co. offered a prize for a novelette; the Williams and Wılkins Co. for the best popular scientific book; the John Anisfeld foundation, through the Saturday Review of Literature, a prize for the best book on race relations; to be joined, later, by Julian Messner, Inc., with a prize for the best book promoting tolerance; the Yale university prizes to younger poets and the Avery Hopwood awards to new novelists and dramatists exercised great influence. The New York Herald Tribune offered three annual prizes for the best books for children in three age groups. Doubleday established the George Washington Carver award for the best novel on Negro life. New awards were offered for religious books, mystery novels, and almost every other type of book.

In addition, literary fellowships during the decade were

established by publishers, among them Houghton Mifflin, Alfred A. Knopf, Dodd Mead, Harper's, and the Bruce Publishing company. And, by 1937, what was in effect the largest system of fellowship grants in history, the cultural projects of the Work Projects administration was in full swing. Through the guide books prepared by the various state writers' projects, the impulse was given to what became a major publishing trend—the collection of folklore, the description of U.S. lakes, rivers, mountains, cities and regions; and revaluations of the U.S. past.

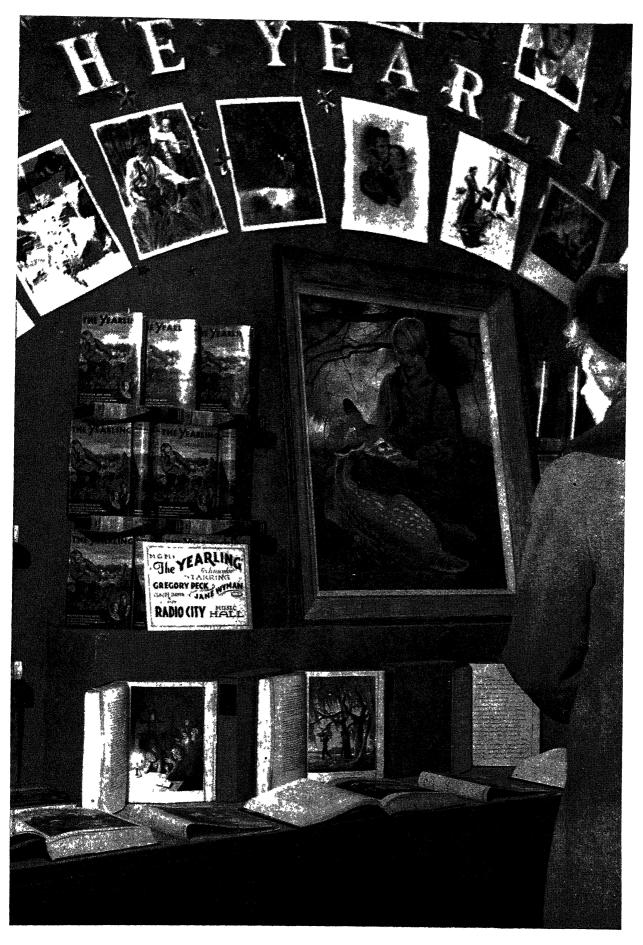

Publishing itself had an honour instituted to reward special achievement. In 1943, the first Carey-Thomas award, named after two pioneers in U.S. publishing, was instituted by Publishers' Weekly. Prizes were awarded to Farrar and Rinehart for the "Rivers of America" series, the University of Chicago Press for Sir William Craigie's Dictionary of American English, E. P. Dutton for Van Wyck Brooks's The World of Washington Irving and Knopf for H. L. Mencken's The American Language. (See also LITERARY PRIZES.)

Trade Organizations.—In the book trade itself, the trend toward organization was strong. In 1937, the National Association of Book Publishers reorganized as the Book Publishers' bureau to concentrate on legislative trade information and credit supervision. In 1945 it underwent another reorganization, emerging as the American Publishers' council. The new organization, of which Harry F. West was made executive director, undertook a program of general promotion and research with credit supervision left to a separate body carrying the old name of the Book Publishers' bureau.

The decade also saw trade union organization among book trade employees. The union first involved was the Office Workers' union, which was subsequently merged into the United Office and Professional Workers' association. The branch of the U.O.P.W.A. covering the book trade was the Book and Magazine union. Shops belonging to it included a number of publishing houses, two large bookstore chains, a book club, a large paper-book publisher and a large wholesale house.

Book Publishing in Wartime.-When war came to the U.S. in 1941, book publishing played its part in bringing victory. Publishers' lists were geared to the war effort. The industry organized itself into the Council of Books in Wartime. It publicized morale-building books, naming as "imperatives" They Were Expendable by W. L. White, One World by Wendell Willkie, Into the Valley and A Bell for Adano by John Hersey, United States Foreign Policy by Walter Lippmann, and People on Our Side by Edgar Snow. It issued reading lists and published War Atlas for Americans, which was sold at cost and helped to make clear the global nature of the war. It produced movie shorts and conducted radio broadcasts. Together with the Writers' War board, and the Book and Author War Bond committee, it took part in the victory bond drives, the Red Cross blood bank, and in collecting relief for allies of the U.S. Perhaps its greatest achievement was in producing the famous Armed Services editions, of which hundreds of millions of copies were printed. In their convenient pocket format, they became battle comrades on the front lines.

In the closing years of the war, there was a trend in U.S. publishing toward mergers and toward concentrating formerly separate branches of the book trade under single

controls. Thus the Doubleday company now owned printing and binding plants, a bookstore chain, reprint companies, several book clubs and other mail-order enterprises, and had absorbed a number of large publishing houses. Simon and Schuster, controlling Pocket Books and the Peoples' club, was bought by the Marshall Field Publishing enterprises. Other combinations occurred which contributed to the fears expressed by many in the book trade that the industry was moving toward monopoly controls.

At the same time, independent ventures continued. Individual talent remained at a premium, competed for by prizes and fellowships, and individual personality remained an important factor in the publishing industry itself. (See also COPYRIGHT.)

Great Britain.—The period 1937-46 was the most phenomenal decade in the history of British publishing. In 1937, intensive overproduction had culminated in the biggest annual output figure-more than 17,000 titles-ever recorded in book trade annals. Six years later, stringent restriction on production having in the meantime coincided with a great expansion in reading, the output figure was the lowest on record, and glut had become famine. The table shows the great change that took place during these years. The turnover figures represent the amount of business done by publishers; the retail sum spent on books would be approximately one-third more.

British Book Publishing, 1937-46

				Prod	uction*	Tur	nover

*Figures taken from The Bookseller, British book trade journal. †January-June turnover figures for 1946 total: £12,293,692; export, £3,095,929.

With the outbreak of war in Europe, the conditions of the British book trade, already debilitated by years of overproduction, dwindled; the 1940 figure for publishing turnover was the lowest on record. Energy was restored to the trade largely through adversity. In 1940 the government proposed a tax on books. The proposal was vehemently resisted by the trade, and the treasury withdrew books from the scope of the general purchase tax. During the air attacks on London, publishing suffered its fair share of the damage done and, on the night of Dec. 29, 1940, rather more than its share. On that night took place the great incendiary raid on that part of London known as the City, in which are situated Paternoster row, Ave Maria lane and Amen corner. These little streets, clustering round St. Paul's cathedral, were the historic centre of the British book trade and many of the older houses, including some of the largest (Oxford University press, Longmans Green, Nelson, Hutchinson), still had their businesses there. There, too, were situated the great wholesale booksellers, Simpkin Marshall, Ltd., whose stock was reputed to contain some 4,000,000 books. In the conflagration that night many millions of books were reduced to ashes.

This destruction contributed to the shortage of books that presently began to manifest itself. Because of their

scanty supplies of paper, publishers were unable to make good the losses. For the greater part of the war they were limited to a ration of 37½% of the paper they had used in 1939, a year of great political tension and general anxiety in Europe and which, for that very reason, had been a bad one for publishers.

In an effort to use their limited resources to the best advantage, the British publishers imposed upon themselves a war economy standard of book production which, by limiting sizes, widths of margins, etc., enabled them to produce the maximum number of copies from every ream of paper. Certain types of book, e.g., dictionaries and textbooks containing diagrams, were not easily adaptable to this form of compression. Moreover, it was in the field of educational books that the shortage was most acute.

Despite the fact that the publishing trade in Britain was crippled by shortages of raw materials and labour, there was an extraordinary increase in the number of publishers. The reason for this was a curious anomaly in the regulations governing the use of paper. While a book publisher established before 1939 was rigidly limited to a paper quota based on his consumption in that year, any other person in Britain was at liberty to use legally, for book production, as much paper as he could persuade any printer to supply. In 1939 the total membership of the British Publishers' association was less than 130; during the years 1942-46 there was rarely a week that did not see the registration of at least one new publishing firm. During 1945 and 1946, the tonnage of paper allocated to quota-holding publishers had increased by successive stages to 80%, and since book papers were then only a fraction of their prewar weight this tonnage provided for the output of a larger number of books than before the war. In 1946 the gap between supply and demand was shortening, but it was stated in the house of commons that 44,000 standard books were completely out of print, and 8,000 manuscripts were waiting to be published.

Europe.—The German publishing industry, best organized in the world, had by 1937 been purged of all intractable elements, and from 1939 onward constituted a docile department of the nazi ministry of propaganda. In 1944 the great book publishing centre in Leipzig was obliterated by bombs, and such organized publishing as remained was involved in the general disaster that overtook Germany in 1945. Publishing in France and the Low Countries, arrested during the five years of German occupation, had later to contend with shortages of raw material and fuel. The outstanding development in continental publishing during the decade was the renaissance of the Swiss publishing industry. After two periods of greatness, Switzerland's contribution to publishing had declined as Leipzig's importance grew. The establishment of the nazi regime in 1933 provided Switzerland with the opportunity of regaining the position it held at the time of the Reformation as the centre of free thought and international culture in the heart of the continent. (E. SE.)

Boothe, Clare

See Luce, Clare Boothe.

Bor, General

See Komorowski, Tadeusz.

Borah, William Edgar

Borah (1865–1940), United States senator from Idaho, was born in Fairfield, Ill., June 29, 1865. He was educated at Southern Illinois academy at Enfield, and at the University of Kansas. He was admitted to the bar in 1889 and practised at Lyons, Kan., for two years. In 1891 he went to Boise, Idaho, and devoted himself to his profession until he was elected to the senate in 1906; he was re-elected five times. Borah served as chairman of the following committees: foreign relations, Indian depredations, expenditures of the department of justice, interoceanic canals, education and labour. He opposed the entrance of the U.S. into the League of Nations and the Permanent Court of International Justice. He died in Washington, D.C., Jan. 19, 1940.

Boris III

King Boris III of Bulgaria (1894-1943), was born Jan. 30, 1894, at Sofia, eldest son of Tsar Ferdinand I and Princess Marie Louise of Bourbon-Parma. Boris ascended to the throne in 1918 after his father's abdication, successfully weathered a series of political storms during the troubled postwar period and entrenched his authority by using his police force to "liquidate" political foes. Boris paid little attention to parliamentary government during his reign. In 1934, he approved a military coup d'état engineered by the "palace guard," who suppressed the constitution, dissolved parliament and banned political parties. A year later, Boris established himself as dictator, paid frequent visits to Adolf Hitler and Benito Mussolini and geared his foreign policy to that of the axis. He was forced to give German armies the right of transit across Bulgarian territory in Nov. 1940, and to join Hitler and Mussolini in declaring war on the United States in Dec. 1941. Boris refused, however, to declare war on the U.S.S.R., aware of the great sentimental attachment of his subjects for "Mother Russia." Boris' popularity waned as the war continued. Rioting in Sofia on May day, 1943, was so serious that he was compelled to flee the capital for his own safety. His death in Sofia on Aug. 28, 1943, was both unexpected and mysterious. An official communiqué said the king had died after a brief illness, but some Hungarian sources in Berne said the king had been assassinated by one of his own police bodyguards. His six-year-old son, Simeon II (q.v.), succeeded to the throne.

Bormann, Martin

Bormann (1900–1945?), German politician, was born June 17, 1900, in Halberstadt, Germany. After World War I he participated in the German Free corps raids conducted along the Latvian frontier. Imprisoned for a political offense in 1923, he was released two years later and joined Adolf Hitler's newly-created National-Socialist party. In 1933, he became chief of staff to Rudolf Hess, then deputy fuehrer, and was also a member of the reichstag. After Hess's flight to Scotland in May 1941, the position of deputy fuehrer was vacant until Oct. 16, 1942, when Hitler designated Bormann to that post with powers exceeding even those of his predecessor. Bormann, who had great influence over Hitler, was active in the persecution of Jews throughout Europe and in fostering the slave labour program.

Of the 22 top nazi war criminals indicted by the International War Crimes Tribunal at Nuernberg, Bormann

was the only defendant not present. It was presumed that he was either dead or a refugee from justice. According to a British report on Hitler's death, Bormann cremated the fuehrer after he committed suicide April 30, 1945. Bormann, who had been named party minister in the new government designated in Hitler's last will and testament, disappeared from sight thereafter. He was indicted Aug. 29, 1945, by the Nuernberg Tribunal and was found guilty and sentenced to death in absentia by the tribunal on Oct. 1, 1946.

Borneo, British

The area known as British Borneo, as distinct from Dutch Borneo (see Netherlands Colonial Empire), before World War II comprised the three states of Sarawak, Brunei and North Borneo, all under British protection. Each of these three states was entirely separate from the other two with its own system of rule.

Sarawak.—Area c. 50,000 sq.mi.; pop. (1946 est.) 600,000, mainly Malayan and Dyak tribesmen. Chief town: Kuching (cap., 30,000). Ruler: hereditary rajah Sir Charles Vyner Brooke, the third of his line (May 17, 1917–July 1, 1946). Sarawak became, on July 1, 1946, a crown colony; governor: Sir Charles Clarke (after July 20, 1946).

North Borneo.— Area 29,347 sq.mi.; pop. (1946 est.) 300,000, two-thirds of whom are aboriginal tribes (Dusuns, Bajaus, etc.) living inland and the rest mainly Chinese (c. 50,000) and Malayan (Mohammedan) settlers on the coast. Chief town: Sandakan (cap., 13,800). Property of and ruled by the British North Borneo (chartered) company (president, Maj. Gen. Sir Neill Malcolm), which in agreement with the British government appointed its own governor. The last, C. R. Smith, took office in June 1937. On July 15, 1946, it became a crown colony; governor: E. F. Twining (appointed July 20, 1946).

Brunei.—Area 2,226 sq.mi.; pop. (1946 est.) 41,000, mainly Malayan (Mohammedan). Chief town: Brunei (cap., 12,000). Ruler: Sultan Ahmed Tajudin Akhazul Khairi Wad-din. British resident: J. Graham Black (1937–39); Major E. E. Pengilly (after 1940); W. J. Peel (after May 1946).

Prosperity Interrupted.—All three areas were distinctly prosperous, particularly Sarawak and Brunei, which had progressed rapidly after the discovery of rich deposits of oil which brought in substantial revenues. North Borneo, without any ascertained mineral wealth, was a purely agricultural country dependent principally upon rubber and timber and consequently less well placed financially than its wealthy neighbours. Nevertheless, there too the company, the last survival of a once well-established colonial system, was going steadily ahead.

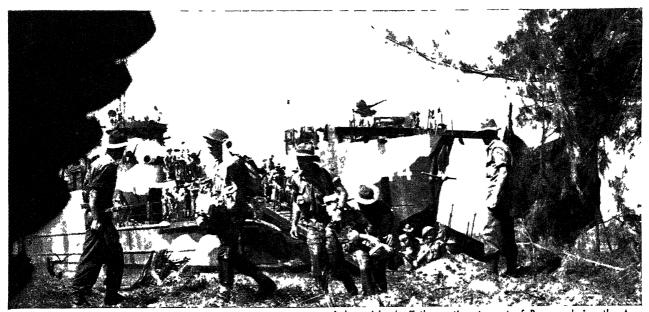

The reason was obvious. The shadow of war was growing darker over the far east until on Dec. 7–8, 1941, the crash came at Pearl Harbor. Indo-China, Siam and Malaya were quickly overrun and even Singapore was able to put up only a brief resistance. Borneo's turn followed. On Dec. 18, 1941, the Japanese landed in Sarawak; a week later they were in Brunei and on Jan. 3, 1942, they were on the west coast of North Borneo. Sandakan, the capital town, was not occupied until some time later and during the intervening weeks was in wireless communication with London. The whole country, however, was completely at the mercy of the Japanese, who by Jan. 19, 1942, were in absolute control. From that date until Sept. 1945, when the territory was reoccupied by Allied forces, very little information of the history of these protected states was

British Borneo: Statistical Data

available. Certainly there was desultory fighting in which many Japanese lost their lives, and in Oct. 1943 there was an ill-timed and ill-organized uprising by the Chinese in Jesselton on the west coast of North Borneo. It was suppressed with little effort but great savagery by the well-armed Japanese troops. Meanwhile the Europeans who were taken in all three states were interned in Kuching, the capital of Sarawak, except for a few highly-placed officials who were carried off first to Formosa and subsequently to Manchuria where they were finally found and liberated by the Russians.

After the end of World War II there was much discussion concerning the future organization and government of these three states, which were geographically, commercially and economically very closely allied to Malaya. Sarawak had taken the first step in 1941 when a form of constitutional government was introduced by the rajah. In 1945 the second step was taken when, not without some opposition, the rajah voluntarily handed over his responsibility to the British colonial office. In North Borneo the initiative was taken by the colonial office in the form of a letter, dated June 20, 1944, informing the president of the chartered company that it had

Labuan Island off the northwest coast of Borneo, during the Australian invasion of June 10, 1945. Japanese resistance ended within a week

"come to the conclusion that it would be desirable that on the liberation of North Borneo H. M. government should assume direct responsibility for the government of the territory." To this statement of policy the directors of the company offered no objection, as indeed they agreed on broad principles that it was a right and timely decision, and accordingly on July 15, 1946, on the termination of the period of military occupation, the colonial office replaced the chartered company as the governing authority. After prolonged discussions it was agreed that the difficult question as to the price to be paid to the shareholders in compensation for their assets in North Borneo could be fairly decided only by arbitration. Meanwhile the rich though small state of Brunei was separated from the Malayan system, and the island of Labuan with its fine anchorage was once again joined with North

These constitutional changes did not result in the amalgamation of the three Borneo territories into a single state, though it was thought that this might come later; they retained their separate entities: Sarawak and North Borneo as colonies and Brunei as a protectorate. Much romance had gone, but the tradition remained as the foundation of future progress.

The Sarawak government published on Dec. 18, 1946, an order prohibiting the entry into the state of Anthony Brooke, nephew of the former rajah, Sir Charles V. Brooke. Brooke openly and frequently expressed his intention of changing the form of government and restoring the Brooke regime. Opposition to the constitutional change was voiced mainly by a small minority of Malays who feared that their previous privileged position would be threatened.

Boron Minerals

This heading includes a number of natural boron

compounds—borax, anhydrous, sodium tetraborate, kernite, boric acid, colemanite and occasionally ulexite. The United States normally produced about 90% of the world supply, with small amounts from Argentina, Italy and Turkey.

The largest use of borax continued to be in glass, and it was here that war demand was most evident. On the other hand the second largest use was in porcelain enamels, and so long as the production of refrigerators, washing machines, kitchen utensils and similar articles was restricted, consumption declined. It was the reconversion of these industries from war production, supplemented by an improvement in the export market, that led to the increased activity in the production of boron minerals in 1945.

Boron Minerals in the United States (Short tons)

							Sales	B ₂ O ₃ Content	Value	Exports	able Supply
1937							358,898		\$7,232,897	154,052	204,846
1938							215,662		4,739,291	77,519	138,143
1939							245.284	81.800	5,689,797	91,139	154,145

1945		-				:				43,577	282,359

During the years of World War II a new development was the use of boron as a supplementary hardening agent in alloy steels; while this step was important technologically, it had little effect on production since the amounts used were so small, usually only thousandths of a per cent in the finished steel. (G. A. Ro.)

Boston

Capital of the state of Massachusetts, with an area of 46.1 sq.mi. where the Mystic, Charles and Neponset rivers meet Massachusetts bay, Boston ranked ninth among cities of the United States in 1940, with a population of 770,816 (federal census). The population was 766,386 by the 1945 state census. The latter figure marked a decline of 0.6% in five years, a decline of 1.3% in the decade following the 1930 federal census, and a decline of 6.3%

in the decade after 1935, when the maximum of 817,713 was recorded by state tabulation.

While only one-sixth of the population of Massachusetts (4,316,721 in 1940; 4,493,281 in 1945) resided in Boston, about half lived in the metropolitan area. Actually there were many zones, including Boston and a varying number of cities and towns, designated for specific purposes. The metropolitan transit district comprised the 14 municipalities served by the Boston Elevated railway; 25 were in the Boston postal district; 20 had a metropolitan water supply; 33 a common sewerage system. The state census recognized a metropolitan Boston, including 43 municipalities with 2,066,100 inhabitants in 1945, a ten-year increase of 2.2%. Larger still was the metropolitan Boston of the 1940 federal census, with 83 cities and towns, an area of 1,097.5 sq.mi., and a population of 2,350,514, a ten-year gain of 1.8%. Only four metropolitan areas in the U.S. (New York, Chicago, Los Angeles, Philadelphia) surpassed Boston.

City Government and Politics.—Boston was governed by a mayor and council under a charter passed by the state legislature (Ch. 486 of Acts of 1909) and subsequently amended. No major changes occurred in the decade 1937–46, but in the latter year the legislature met a growing civic demand for improvement by creating a Special Charter commission to consider such alternatives as the city manager system with proportional representation or piecemeal amendment of the old charter. Elections, nonpartisan and separate from state and national elections, occurred in November of odd-numbered years. The mayor (4-year term) and councilmen (one from each of the city's 22 wards, with 2-year terms) took office the first Monday of the following January.

Four different mayors served within the decade. Frederick William Mansfield completed his term in 1937. Maurice Joseph Tobin won the November election by a 25,000 plurality over former Mayor James Michael Curley. In 1941 Tobin again defeated Curley by 9,000. When Tobin won the election for governor of Massachusetts in 1944, he resigned as mayor and John E. Kerrigan, president of the city council, became mayor for the unexpired term. In 1945, by capturing 114,930 of the 247,477 votes cast, Curley defeated Kerrigan and four other contestants for the mayoralty.

James M. Curley, at the age of 71, became mayor of Boston for the fourth time in his colourful career, having won the elections of 1913, 1921 and 1929. Since he also had served two years as governor of Massachusetts (1935-36), his return to city hall heightened the contrast with his rival Tobin installed at the state house on Beacon hill. Moreover, Curley still kept his seat in congress as representative from the 11th Massachusetts district. Both locally and nationally he stood in a strong light because during the mayoralty race he was under federal indictment charging use of the mails to defraud, back in 1941. Curley was convicted Jan. 18, 1946, and on Feb. 18 sentenced to 6 to 18 months in prison and \$1,000 fine, out of a possible 47 years and \$19,000 penalty. He promptly appealed; and, when three days later a brass band, 22 police and a crowd of 10,000 greeted his return to Boston, he informed the public that his case would probably not be reached until April 1947, "so I'll have ample time to conduct the duties of both positions without interference."

Role in World War II.—The city of Boston sent 90,000 men and women into the armed forces, of whom 2,700 died in service. Supporting activities of the metropolitan

area were so varied and vital as to defy enumeration. Highlights were: Shipbuilding by Bethlehem in Quincy and Hingham, the navy yard and dry dock in Charlestown and South Boston; turbines, radar and other electrical products by General Electric in Lynn, Raytheon in Waltham; heavy ordnance at Watertown arsenal; small arms, ammunition, machine tools in scores of specialized plants; engineering for the Manhattan Project by Stone & Webster; research for army, navy and the Office of Scientific Research and Development by personnel of Harvard, Massachusetts Institute of Technology and Boston university; Red Cross blood donor centre visited by thousands.

Business and Financial Activity.—There were two contrasting periods of business activity; upon a basic moderate rise through 1940 was superimposed a sharp jump during the war. Bank clearings, for example, rose from \$12,106,585,000 in 1940 to \$19,591,000,000 in 1945; gross postal receipts from \$17,050,182 to \$22,661,381; the department store net sales index from 71.2 to 113.5; passenger traffic on the Boston Elevated railway from 294,451,000 to 420,096,000; average number of wage earners in the Boston industrial area from 249,523 to 348,436 in 1944.

The property tax levy showed a downward trend to 1944 (\$57,500,000), sharply reversed in 1945 (\$62,900,000) and 1946 (\$64,500,000). For, though the tax rate climbed unsteadily (1937=\$37.80; 1945 high \$42.50; 1946=\$42.00), assessed valuations real and personal shrank 27% from the 1930 peak (\$1,972,000,000) to 1944 (\$1,442,000,000), then rose 6.5% to \$1,536,385,600 in 1946. Tax collections steadily improved from 72.3% in 1937 to 89.7% in 1945, while the ratio of total debt to valuation was reduced from 8.2% to 6.4%. Current expense borrowing tapered off sharply in the three years prior to 1946, but was resumed under the Curley regime.

Postwar Picture.-Relying on the achievements and trends of the decade, Boston by 1946 was committed to physical development along many lines of public improvement and private construction. Logan airport grew rapidly, with \$30,000,000 authorized and a program calling for \$20,000,000 more. The Boston port authority received enlarged scope by the 1945 law, with \$11,000,000 authorized for new piers. Authorizations for traffic relief included off-street parking in downtown Boston (\$5,000,000) and a Mystic river bridge (\$20,000,000), while plans for a second East Boston traffic tunnel (\$15,000,000) and extension of rapid transit routes and equipment (\$46,000,000) awaited legislative action. Housing projects (\$10,000,000) were delayed by administrative conflicts. Largest private construction projects under way were Edison company's expansion and modernization (\$40,000,000), New England Telephone's five-year program (\$90,000,000), the John Hancock office building (\$15,000,000) and General Motors' assembly plant (\$12,000,000) in Framingham.

Boston's achievement and its commitment, however, were only partly represented by physical size and dollar valuation. The real Boston of the 1930s and 1940s was an idea, just as it had been in the 1630s, at work in the lives of its people.

Botanical Gardens

The Brooklyn Botanic Garden Record (1937) listed and described more than 525 botanical gardens and related institutions in various parts of the world, and the

Committee on Botanical Gardens and Arboretums, American Association of Nurserymen (1939) listed and described about 150 such institutions in the United States alone. The latter list showed that there were 18 states in the U.S. with no botanical gardens or arboretums. These lists failed to report some well-established gardens and of course failed to report herb, drug and other gardens maintained by private individuals or institutions and open to the public free or with fees. The two lists showed, however, the great public interest in these outdoor exhibits of plants. In most cases these exhibits were accompanied by greenhouse exhibits and by researches in various lines of plant science. While these institutions naturally gave more attention to systematic botany than to any other phase of the science, physiology, pathology, genetics and biochemistry also received considerable attention, and much attention was given to practical horticulture and some to applied agriculture.

That the interest in botanical gardens and arboretums increased greatly during the decade 1937-46 and was still increasing at the end of that period was made evident by several facts; the new gardens organized just previous to or during the decade; enlargement and increased facilities in the older gardens; and new gardens projected for the future. During the last half of the decade the projected growth of gardens was decidedly hindered by World War II. Within the battle zone great destruction rather than improvement was the rule, while outside the battle zone war demands for material and manpower stopped nearly all activities beyond scant maintenance. During the war many botanic gardens shifted their emphasis to war needs, such as instruction and direction in vegetable gardening, aid in use of plants for camouflage, and instruction, especially in the Pacific, on native plants that were poisonous or could be used as food.

New Gardens of the Decade.-The Cornell University arboretum, established in 1935, was developed largely in the decade 1937-46. The name was changed in 1944 to Cornell plantations with a great extension in scope of activities. It was to embody the whole series of enterprises based on the land including animal as well as plant studies. A 16-page quarterly magazine was started in 1944. Three thousand acres of land, including those of the university and state agricultural colleges were to be developed as an integral unit under the direction of Dr. L. H. Bailey. A study would be made of the effect of climate, sites, soils, etc., on plant societies. There were to be permanent areas, areas planted as beauty spots, and recreational and agricultural areas. This was a notable development in the field in that it combined behind the botanical garden idea all the developments of a large university concerned with plant or animal science.

The Montreal Botanical garden belonging to the city of Montreal also was developed almost entirely during the "eventful decade." It contained about 600 acres of developed and undeveloped land valued at \$3,000,000, and \$6,000,000 was spent on development and construction largely during 1937-39. It was adequately equipped to carry out every function of a botanic garden. The large administration building housed offices, laboratories, library, herbarium, lecture hall, etc. It had 23 service greenhouses, and provision was made for large display greenhouses. It had special gardens covering the following subjects: annual flowers, perennial displays, fruits and berries including grapes, medicinal, economic, and water and bog (109 basins) plants, alpines, and a fruticetum. There were school children's vegetable gardens and a model vegetable garden for a family of five. The founder and first director,

Dr. F. Marie-Victorin, was killed in an automobile accident in 1944 and was succeeded by Dr. Jacques Rousseau. Henry Teuscher was named curator of the botanical garden and of the city parks and greenhouses in 1935.

The Fairchild Tropical garden at Coconut Grove, Fla., a beautiful collection of tropical trees and shrubs, was dedicated March 23, 1938. The botanical garden in Halliday park, Indianapolis, Ind., was opened in 1940. It included a systemic collection and rock, water and desert gardens were planned. The Hamilton arboretum, Irvington, N.Y., under the auspices of Columbia university, was also opened during the decade.

Although under consideration as early as 1933-35, the University of Washington arboretum at Seattle, Wash., had its main development within the decade. Besides growing many woody plants (oaks, magnolias, conifers, maples, dogwoods, flowering quinces, etc.) it carried out extensive hybridizations of azaleas and rhododendrons collected in China and obtained from Arnold arboretum, Forest Hill, Boston, Mass., Kew, London, Eng., and Edinburgh botanical gardens. In 1945 the arboretum held its first exhibit of hybrids of these plants resulting from 1940 crosses. A number of hybrids appeared that were superior in colour to those already on the market. The arboretum also developed a garden of camellias and related species consisting of about 200 varieties, and planned greatly extended activities under increased appropriations for the postwar period. The director, Dr. John H. Hanley, spent six months at Kew in 1946 to make observations for use in the future development of the arboretum.

Changes in Older Botanical Gardens.-In 1939-40 the Netherlands government planned combining various plant science institutions of Java with the government gardens at Buitenzorg. The garden already consisted of a museum, herbarium, aquatic experiment station, and the Treub laboratory. The institutions to be added were the government agricultural experiment station, the forestry experiment station, the agricultural station of West Java working on quinine, rubber and coffee, and the chemical and technical laboratory dealing with plant pathology, physiology, biochemistry, etc. The sugar experiment station in East Java and two tobacco experiment stations were not included in the consolidation. The war and Japanese occupation prevented the execution of this plan and stopped most work in the institutions. Other damage was slight.

All the botanical institutions connected with Harvard

were combined in 1935 and put under the directorship of Dr. E. D. Merrill as professor of botany, administrator of botanical collections, and director of Arnold arboretum. During the decade 1937-46 there was a great increase in the collection of living materials to a total of 6,500 species and varieties of woody plants. The taxonomic collections were broadened especially with materials from Asia, Malaysia and Papuasia. Resident botanists in this vast area, financed by the arboretum, collected much plant material especially in China, New Guinea, the Solomons, and regions of Africa and North and South America. Material additions were also made by the later extensive collections of the Richard Archbold expedition. Reference collections in the library increased, and important contributions were made to botanical bibliography: E. D. Merrill and E. H. Walker, Bibliography of Eastern Asiatic Botany (1938); Merrill, Botanical Bibliography of the Pacific Islands (in press, 1946); Alfred Rehder, Bibliography of Cultivated Trees and Shrubs (in press, 1946); and

Merrill, Index Rafinesquianus (in preparation in 1946). The staff rendered much assistance to the war effort in chemical warfare, made an Alaska military highway survey, assisted the Army Medical school and aided army officers on plant problems from New Caledonia to Upper Burma. "Plant Life of the Pacific World" was prepared especially for the war servicemen in this region.

As early as 1925 the Missouri Botanical garden had found that the smoke of St. Louis was interfering seriously with the growth of conifers and other plants in the 75acre city garden. At this time it purchased 1,600 acres of land at Gray Summit, 35 miles west of the city. During the decade 1937-46, looking forward to better varieties for the middle west, it gave much attention to developing on this land azalea gardens, many acres of naturalized daffodils of many varieties, a crabapple orchard of many new varieties and hybrids, and a boxwood garden (dedicated by the Federated Garden Clubs of Missouri, 1946) consisting of many varieties from the Balkans. The garden continued operating a stock and a general farm on this land, connecting the operations with its scientific work. It moved all the extensive investigations on orchids, including hybridization, water culture, and study of light relations, to the 12 large ranges of greenhouses at the arboretum. These studies proved of great value to amateur and professional orchid growers. At the city garden the culture of succulents and bromeliads was greatly increased through collections by Ladislaus Cutak from Florida, southwest U.S. and northern Mexico. The large palm house was modified to shelter this collection. The garden made studies on the genetics of yeast (Dr. Carl C. Lindegren) and held a conference of 50 specialists (1945) on "Gene Action in Microorganisms" and reported the conference in the garden Annals. It also made extensive studies of the origin of maize and the history of its cultivation (Dr. Edgar Anderson) and co-operated with a hybrid corn producer on corn breeding. It closed the Panama Canal Zone station in 1939 but renewed this connection in 1946 with Paul H. Allen as tropical collector. It published the first volume on the flora of Panama in 1943 and continued later publications on this subject.

During the decade, Brooklyn Botanic garden added two new "gardens within a garden": the herb garden (1938) containing examples of Elizabethan knot gardens and specimens of culinary, medicinal and poisonous herbs, and the Dean Clay Osborne Memorial, showing how to use ordinary material in making attractive ornamental gardens. In 1940 the garden reached the maximum in registration in garden courses, 1,359 against 973 in 1936. In 1945 it established a teaching fellowship in honour of Ellen Eddy Shaw, who retired as curator emeritus of elementary instruction. On Aug. 9, 1943, Dr. C. Stuart Gager died; he had been director for 33 years, since the inception of the garden. Dr. George M. Reed was acting director for nearly a year, after which Dr. George S. Avery, Jr., became director. In 1945 Garden Record was changed to Plants and Gardens, which published articles of outstanding horticultural interest or of especial value to laymen as well as news about the garden. The garden installed a new laboratory in plant physiology under the direction of Dr. Avery. Dr. Alfred Gundersen continued his work on classification of the dicotyledons; Dr. George M. Reed his work on disease-resistant cereals; Dr. H. K. Svenson his investigations on the flora of the Galapagos Islands as compared with that of the western coast of South America; Dr. Arthur H. Graves his breeding work on chestnuts, seeking disease-resistant hybrids; and Dr. Avery with assistants started work on plant hormones.

New York Botanical garden rebuilt its main conservatory during the decade at a cost of \$350,000 and rearranged the collection within it, improved facilities for propagating and growing plants, returned a considerable area to the city of New York for park purposes and fenced in the rest of the garden, developed a plan for increasing the physical facilities of the garden involving a total cost of about \$2,700,000 and developed new laboratories for plant physiology.

It continued the explorations of Dr. Bassett Maguire in British Guiana and Surinam, of E. J. Alexander in Mexico, Dr. W. H. Camp in Ecuador and Otto Degener in the Hawaiian and Fiji Islands, and explorations of other members of the staff in continental U.S. More than 352,000 specimens were added to the herbarium and 7,100 volumes to the library.

The Hemlock arboretum at "Far Country," Germantown, Philadelphia, Pa., increased its accession number to 211, representing in all 9 species of Tsuga and 40 variations of these species. There were at least 25 easily identifiable varieties of T. canadensis, 5 of T. caroliniana and 4 of T. Mertensiana. The Morton arboretum, Lisle, Ill., erected the Thornhill building which housed the library, lecture hall, class rooms and laboratories. Aside from developing the arboretum, great emphasis was put on an educational program for children and adults. On its 948acre tract, the University of Wisconsin Arboretum and Wildlife refuge added many thousands of trees to both the Tamarack and White Cedar associations, studied plant associations in upland and lowland prairies, initiated an extensive study of songbird nesting, established a wood duck colony, studied the effect of crowding of mixed fish populations in ponds, and increased the planting of wild flowers on the wild flower trail.

Projected Gardens.—Some new gardens and arboretums were projected for the postwar future. The Soviet Academy of Sciences planned a new botanical garden of 650 acres at Moscow with Nikolai Tsitsin, the originator of perennial wheat, as director. It was to consist of large conservatories, laboratories, halls and ornamental plantings. The John J. Tyler arboretum, Lima, Pa., was planned under the directorship of John C. Wister; and Houston, Texas, was considering the organization of an arboretum. Robert Allerton made a gift of "The Farms" (6,000 ac.), Monticello, Ill., to the University of Illinois. Robert Allerton Park and the residence with the valuable art collection would provide for a co-ordinated research program in forestry, entomology, zoology, biology, and in fine and applied arts blending architecture and landscape architecture.

One hundred acres were set aside for 4-H clubs and related educational programs. Much of the rich land was to be continued as grain and stock farms to support the educational and research programs. (See also BOTANY; HORTICULTURE.)

Botany

The period immediately preceding World War II was one of unprecedented progress in the utilization of plants for practical ends and for the solution of fundamental biological problems. Botanical activity was centred not only in English and German speaking countries, but also in many other parts of the world. The Scandinavian countries, and especially Sweden, constituted a very important centre. The U.S.S.R. and Japan were extremely active. Botanical research made rapid progress in India, China and Latin America. An extensive program of investigation was maintained in The Netherlands, and the Netherlands Indies. All parts of the world witnessed a significant expansion of botanical investigation.

In nature and scope, these activities covered a great variety of theoretical and applied fields, ranging from plant exploration and classification to fundamental researches on the nature of living matter. An interesting and important trend during 1937-46 was an increased emphasis upon the experimental as opposed to the purely descriptive approach in the older fields of botany, a tendency particularly noticeable in the hitherto primarily descriptive fields of taxonomy and morphology. Taxonomy rapidly shifted from the collection and cataloguing of plants to an attack upon the problems of evolutionary development and relationship, of the nature and origin of species, of the factors maintaining species or bringing about their modification. In order to study plant populations as dynamic developing assemblages, the taxonomist had to use the techniques of genetics, cytology, ecology and other fields of botany. One may cite for example, the extensive work of E. B. Babcock and G. Ledyard Stebbins, Ir., on the hawkweed, Crepis, in which analysis of alterations in chromosome number and structure provided an important clue to the evolutionary development of the genus, and to an understanding of the nature and relationship of its various species. Another approach was seen in the extensive transplantation studies begun by H. M. Hall and carried on by Jens Clausen, David D. Keck, and W. McK. Hiesey. By growing plants of the same genetic constitution under very diverse climatic and cultural conditions, they analyzed successfully the roles of heredity and environment in moulding the individual and in modifying the race. Other cases where the experimental approach proved effective included the work of Edgar Anderson on Iris and Tradescantia, of A. F. Blakeslee and colleagues on Datura, and many others.

In the field of morphology, experimental methods assumed increasing importance during the decade. For example, scholars had long argued over the constitution of the growing tips of roots and stems and the manner in which the various tissues of the mature plant are differentiated from these. New light was shed on these questions by the use of such diverse agents as colchicine and X-rays. Sophia Satina and Blakeslee, using colchicine, brought about doubling of the chromosome numbers in certain cells of the growing stem tip. Since it was possible to recognize cells having doubled chromosome numbers under the microscope, it was also possible to trace the cells which had descended from the originally altered cell and thus to determine the positions in the growing point of the cells from which the various regions of root or stem are derived. Robert T. Brumfield used X-rays to the same end, inducing alterations in chromosome structure in individual cells of the growing tip, and tracing the cells and tissues into which the altered chromosomes had been transmitted.

Rare plants, unknown to modern British botany, were discovered in the bomb craters and ruins of London after the peak of German air raids had passed. Here a botanist is examining a new flower which sprang up in a crater enriched with the nitrate of a bomb

Many other noteworthy discoveries and advances were made during the decade in the field of botany. It will be possible to mention only a few of them.

Reference has been made above to the use of colchicine in developmental studies. The possibility of the use of colchicine in plant studies was first suggested by O. J. Eigsti in 1937 and the first results of its use were announced the same year by A. F. Blakeslee and George S. Avery, Jr. Colchicine, a drug from the autumn crocus, destroys the mechanism by which chromosome halves are separated into the daughter cells in cell division, so that the products of chromosome splitting remain together. As a result, cells are produced with a doubled number of chromosomes. From these, plants with doubled chromosome numbers can be obtained. Such plants are often of enormous value in genetical and other theoretical studies. They are also of great practical value inasmuch as they often possess desirable new characteristics. The use of colchicine has become standard practice in certain types of plant breeding experiments, notably in the case of inconstant or sterile, but otherwise desirable hybrids, which become both constant and fertile when the chromosome number is doubled.

Noteworthy progress was made in the technique and utilization of tissue cultures in plants. The early work of G. Haberlandt, W. Kotte, William J. Robbins, Lewis Knudson and others led to the first successful prolonged cultivation of plant tissues by Philip R. White in 1937. Success was first achieved with root tips, but it was later found possible to grow stem tips indefinitely in artificial culture (Shih-Wei Loo, 1945). A later advance was made in the excision of young embryos from seeds and their cultivation in synthetic medium. I. Van Overbeek, H. B. Tukey, Hempstead Castle, L. F. Randolph, A. F. Blakeslee, and others succeeded in growing the excised embryos of a considerable variety of plants, bringing them through to successful maturity. The cultivation of plant tissues made possible the study of many aspects of plant nutrition which had hitherto been beyond the reach of the experimentalist. As a result, the decade witnessed unprecedented gains in botanists' understanding of the role of various chemical elements, of vitamins, etc., in the economy of the plant. Tissue cultures also made possible fundamental discoveries in the fields of respiration and of enzyme action in general. Embryo cultures increased understanding of the physiology of the early stages of development. They also made it possible to shorten the developmental period in many cases. Iris embryos, which ordinarily have a long dormant period, were made to develop immediately if excised from the seed before the period of dormancy commences (L. F. Randolph, 1945). Peach and apricot embryos were excised and the plants thus produced brought to flowering within two years, thus enormously shortening the time required for breeding work (Walter E. Lammerts, 1942). Embryo culture also made it possible to obtain hybrids which would not otherwise have been obtainable. Thus, in Datura and Oenothera, embryos derived from wide crosses frequently become arrested and fail to develop, but if they are excised before they become arrested, they can often be brought through to maturity. In this way, the range of genetical experimentation was greatly extended.

Another new and promising field of botany was the use of radioactive isotopes for the study of certain physiological problems. The course which these radio-active substances take through the plant was traced by the use of radiological equipment, and it became possible not only to study in detail the paths by which materials are transported, but also to follow the sequence of chemical transformation through which they pass and thus to trace the story of metabolism of the plant. To cite but one example, the chemical transformations involved in the process of photosynthesis were partially elucidated by these means (S. Ruben, W. Z. Hassid and M. D. Kamen, 1940). It was found that the initial step in the assimilation of CO₂ is a dark process independent of light. This is followed by the light reaction or photochemical step. Since photosynthesis is undoubtedly the most important chemical transformation occurring in nature so far as life is concerned, the analysis of this process became of fundamental importance. The use of both radioactive and stable isotopes as tools in the study of metabolic processes opened a new and exceedingly promising field.

One of the most striking developments of the decade was the widening utilization of the fungi for scientific and practical purposes. Various fungi were found to be well adapted to the study of many fundamental biological problems. Yeast, for instance, was used for fundamental studies on respiration and the action of enzyme systems,

on problems of inheritance, and on the relation of cytoplasmic to genic factors in the control of heredity. Neurospora yielded data of first importance in regard to the manner in which genes produce their effects (George W. Beadle and collaborators). Knowledge of the physiological basis of sexual union was greatly extended by discovery in Achlya of the hormones responsible for the production of reproductive organs and cells and the union of gametes (John R. Raper, 1939). The brilliant work of E. C. Stakeman, John W. Keitt and others on reproduction, inheritance and mutation in the smuts and rusts was of great theoretical as well as practical importance.

From the practical point of view, fungi took on increased importance as the chief source of certain vitamins such as riboflavin, of antibiotics such as penicillin and streptomycin, of chemical reagents such as acetone, butyl alcohol, ethyl alcohol; as material for the bio-assay of vitamins, hormones, etc. The growing importance of the lower organisms, including the bacteria and fungi, both for fundamental and applied purposes was attested by the growing use of the term "microbiology," which rapidly became a recognized and distinct field. The Botanical Society of America at its meeting in March 1946, organized a new Section of Microbiology to further work in this field.

Conversion for War Purposes.—With the onset of the war the accelerated research activity in botany was rapidly converted into practical contributions toward the war effort. Many botanists became involved in exploratory expeditions, searching for new sources of quinine and other medicinals, of insecticides, rubber plants, food products, oils, etc. The U.S.S.R. and the U.S. were particularly active in this regard. Extensive research projects were inaugurated for the improvement of rubber-producing plants, the most important of which proved to be the Russian dandelion (Taraxacum kok-saghyz), guayule (Parthenium argentatum) and Cryptostegia. The field of antibiotics became one of outstanding importance with the discovery of penicillin, produced by strains of the common blue mould, Penicillium. Intensive efforts to improve the original strain of Penicillium, to discover new and better strains, and to improve by cultural and manufacturing techniques the quantity and quality of the product occupied the attention of many botanists in various countries. The search for other antibiotics and for fungi or other micro-organisms which would yield increased amounts of important chemicals was carried on intensively and successfully. Extensive studies were made of the fungi causing deterioration of fabrics and other materials, and of fungi causing human disease. Increased attention was given to the control of diseases affecting plants of economic importance. The war years, therefore, witnessed the transferral of emphasis from basic and fundamental aspects of botany to practical attempts to place plants and plant products at the service of the war effort. Much of the work done during the war was confidential in character; consequently, the volume of published research in botany tended to dwindle during this period.

During the war the regular scientific meetings of the botanical societies were largely suspended. The Botanical Society of America held one meeting in Cleveland, Ohio, in Sept. 1944, but other wartime meetings were cancelled. The Seventh International Botanical Congress, which was to have been held in Sweden in 1940, was cancelled.

New Laboratories.—Several important new laboratories for the study of botanical problems were established

during the decade. In 1941 the new U.S. plant, soil and nutrition laboratory of the U.S. department of agriculture was established at Cornell university, Ithaca, N.Y., for the purpose of discovering ways of increasing the nutritional value of foodstuffs through studies of soil and crop management, soil types, and plant and animal nutrition. During 1940 and 1941 four huge new regional research laboratories of the U.S. department of agriculture were occupied. These laboratories, situated in Peoria, Ill., Philadelphia, Pa., New Orleans, La., and Albany, Calif., were designed to develop new uses and new outlets for farm commodities. They were important centres of research during the war period.

The story of botanical research during the decade was, in general, one of great expansion and notable discovery during the first portion, and of intense wartime activity during the war period. With the cessation of the war a period of renewed interest in fundamental problems began. (See also Biology; Botanical Gardens; Chemistry; Chemurgy; Genetics; Horticulture; Marine Biology.)

Bowles, Chester

Bowles (1901-), U.S. advertising executive and government official, was born April 5, 1901, in Springfield, Mass. He was graduated from Yale university in 1924. In 1929, with William Benton, he formed the advertising firm of Benton & Bowles, later one of the most successful companies in its field. In Dec. 1941, Bowles took a leave of absence to work on a dollar-a-year job with the Office of Price Administration, later becoming OPA administrator for Connecticut. In July 1943, Prentiss M. Brown, then OPA national director, named Bowles as general manager of his agency. Bowles succeeded Brown Oct. 25, 1943, and throughout 1944 and 1945 battled vigorously to maintain price controls. On Dec. 5, 1945, he denounced "the small minority of business pressure groups" which he said were trying to abolish price controls and predicted inflation "followed by a shattering smashup" if controls were not maintained and extended to 1947.

On Feb. 14, 1946, President Truman established the Office of Economic Stabilization and named Bowles as head of the new agency. During 1946 he fought some demands for price markups, agreed to others and presented a "blueprint" of President Truman's "bulge-in-the-line" wage-price policy which, according to Bowles' prediction,

would open the gates for "the greatest flood of goods this great nation has ever seen." Subsequently he attacked what he called "crippling" amendments to the price control structure, and appealed to congress for adequate funds to fight the black market. After the senate, on June 28, 1946, passed a bill extending the OPA but weakening its price controls, Bowles resigned as director of economic stabilization with the warning that price control under the measure would be "flatly impossible" and urged the president to veto it. Truman did veto the measure the following day; Bowles praised the president for his "courage" in taking action against the "monstrous" and impossible price control bill. Later Bowles unsuccessfully sought the Democratic nomination for governor of Connecticut.

Bowling

Of all popular U.S. sports, bowling probably had the greatest increase in participants and playing facilities from 1937 to 1946. While other sports generally lost ground during World War II, bowling increased in popularity. The adaptability of the game, played by young and old, men and women, led to a steady rise in participants, to an estimated 12,000,000 bowling more or less regularly at the end of the decade.

The American Bowling congress, legislative organization of the sport, was established in 1895 with 60 teams. In 1935, team membership in the A.B.C. reached 41,000; thereafter it grew steadily until the official count during 1946 was set at 183,000 teams. Entries of more than 2,000 bowlers were not uncommon in city and state tournaments, with Detroit, Mich., holding the record at 3,434 for its 1945 city championship.

Biggest bowling event each year continued to be the American Bowling congress championships, which attracted 25,567 bowlers to the 1946 tournament at Buffalo. The 1938 A.B.C. drew 17,441 entries. A record of \$254,704 was distributed as prize money in the 1942 tournament at Columbus, O., during 72 days of pin-smashing.

In the 43-year history of the A.B.C. tournament, a total of \$3,163,914 had been distributed in prize money. The 43 tournaments attracted 284,227 bowlers. Aside from the official championships, the A.B.C. continued to give gold awards for high scores rolled during the calendar year. It also presented gold, silver and bronze medals to those rolling 300, 299, and 298 games in sanctioned competition. As of Aug. 1, 1946, 3,219 gold medals had been awarded to those who bowled perfect 300's. Hank Marino of Milwaukee led the list with 10, followed by Walter Ward of Cleveland, 7; Sam Garofalo of St. Louis, June McMahon of Lodi, N.J., and Hal Schaeffer of St. Louis, six each.

Like many another sport, bowling took a three-year tournament recess during the war years. In lieu of the annual A.B.C. tournament, a series of match game championships unofficially settled the titles for the war years of 1943, 1944 and 1945.

The decade 1937-46 marked a tremendous development in bowling facilities. Twenty-four and 48 alleys, side by side, were not uncommon in the larger cities, and in 1945 experiments on automatic pin-setters were being made. Universal increases in wages forced proprietors to meet the high price of pin boys, and per-line costs to the bowlers were almost doubled over the ten-year period.

A.B.C. Results.—The American Bowling congress attracted 22,000 competitive bowlers to New York in 1937. Eugene Gagliardi of Mt. Vernon, N.Y. won the singles

title with 749, a mark which was unsurpassed in individual competition until 1942. The all-events crown went to Max Stein of Belleville, Ill., with 2,070. Virgil Gibbs and Nelson Burton, Dallas, Tex., won the doubles with 1,359, while Detroit's Krakow Furniture company took the five-man team championship with 3,118.

In 1938, the 38th annual A.B.C. attracted 24,785 entries to Chicago, with Knute Anderson of Moline, Ill., winning the individual crown with 746. The Chicago team of Birk Brothers Brewing company continued the switching of the five-man title from Detroit to Chicago and back with 3,234 points. Don Johnson and Fonnie Snyder of Indianapolis, Ind., captured the doubles with 1,337.

Twenty-three thousand bowlers took part in the 1939 A.B.C. at Cleveland, with Jim Danek of Forest Park, Ill., taking the single event with 730. The team title returned to Detroit on the 3,151 posted by the Fife Electric Supply company total, while Murray Fowler and Phil Icuss of Steubenville, O., won the doubles with 1,405.

The championship of 1940, which drew an entry of 30,000 bowlers from 731 cities to Detroit, marked the first time in A.B.C. history that two 300 games had been rolled. Two Ohioans, George Pallage of Akron and Angelo Domenico of Canton, rolled perfect games, although neither wound up as champion. The A.B.C. titlists were: Ray Brown of Terre Haute, Ind., singles, 742; Herbert Freitag and Joe Sinke of Chicago, doubles, 1,346, and Fred Fischer of Buffalo, N.Y., all-events, 2,001.

In 1941, the A.B.C. was noteworthy for its numerous fine performances, as well as a record attendance of 150,000 attracted to the St. Paul, Minn., scenes of the championship. William Haar of Chicago scored a perfect 300 in the doubles, and William Caskey of Canton, O., recorded a 299. Fred Ruff of Belleville, Ill., won the singles with 745, outscoring a field in which 25 entries rolled 700 or better. Ray Farness of Madison, Wis., recorded a 767, highest score of the 1941 tournament and fifth highest in the classic's history, to team with William Lee as doubles winners with 1,346. The Vogel Brothers team of Forest Park, Ill., won the five-man event, while Harry Kelly of South Bend, Ind., captured the all-events with 2,013.

John Stanley, rolling a near-record 756, won the A.B.C. singles crown at Columbus, O. in 1942. A total of 23,773 individuals bowled for the \$254,704 in prize money. An aggregate of 228,537 games were bowled through the 1942 tournament. In winning the singles crown, Stanley had games of 258, 252 and 245, and his total was second highest in the history of the tournament. Stanley Moskal of Saginaw, Mich., won the all-events with 1,973.

With the A.B.C. canceled in 1943, competitive bowling turned to the National Individual Match Game championship for its titlist. Ned Day of West Allis, Wis., after being voted "Bowler of the Year" by the Bowling Writers' association, won the match game singles title with a 64-game average of 208-plus. Others to finish were: Paul Krumske of Chicago, second; Rudy Pugel of Milwaukee, third; Herbert Bomar of Chicago, fourth, and John Crimmins of Detroit, fifth. Outstanding score among A.B.C. members in 1943 was the 824 rolled by Louis Foxie of Patterson, N.J.

Herbert "Buddy" Bomar of Chicago topped the individual accomplishments of 1944 bowling by winning the National Individual Match game title and teaming with William Flesch, also of Chicago, for the doubles crown. Bomar bested a field of 125 leading U.S. bowlers in a 64-game tournament at Chicago, averaging better than 205 pins. Pvt. Joe Wilman, from Fort Lewis, Wash., by way of Berwyn, Ill., was second, with Ned Day third. The Stroh Bohemians of Detroit retained their team match game championship with victories over challengers from Philadelphia and Detroit.

Pvt. Wilman moved from second to first among the National Individual Match Game bowlers in 1945, toppling 13,437 pins in 64 games for a 210 average. Next in line were: Pvt. Thurman Gibson of Detroit, second; Andy Varipapa of Hempstead, L.I., third; Walter Ward, Cleveland, O., fourth, and Ned Day, West Allis, Wis., fifth. William Kenet and Walter Reppenhagen of Detroit won the doubles title, while the E. and B. team of Detroit ended a four-year reign of Stroh Bohemians, also of Detroit, as team champion.

After a three-year recess because of the war, championship bowling returned to the annual A.B.C. during 1946. Leo Rollick of Santa Monica, Calif., and formerly of Chi-

Boxing

Two figures stood out in boxing during the ten-year span 1937–46. Their careers were intertwined. They were Joseph Louis Barrow, the Joe Louis who came off a share-cropper's land in Alabama to win the world heavyweight championship title, and Michael Strauss Jacobs, who progressed from the not unexciting estate of theatre-ticket speculator to the position of the world's leading boxing promoter.

Louis won the world heavyweight championship by knocking out James J. Braddock in eight rounds at Chicago, June 22, 1937. In ten years he defended the title more often than any other title-holder, irrespective of division, in modern or ancient ring history. He upset precedent upon winning the championship by agreeing to defend it immediately. This he did, within three months, in a 15-round bout against Tommy Farr, who, in 1937, was England's champion. Louis followed this precedent in the years that followed, up to and including the two title defenses he made in 1946, knocking out Billy Conn in eight rounds and Tami Mauriello in 2 min. 9 sec.

In respect to title defenses, Louis stood forth as the greatest heavyweight champion boxing had ever known. Whether he was the greatest from the standpoint of ability could not be measured by any yardstick. There were two schools of thought on the comparative appraisal of Louis and Jack Dempsey. The fact was undeniable, however, that Louis' championship reign already exceeded the Dempsey term from 1919 to 1926, that Louis, of his own volition, had made more title defenses, and that Louis had knocked out every man he faced for the title with the exception of Farr, his first challenger, and Arturo Godoy, Chile, ninth in line, over whom he won decisions.

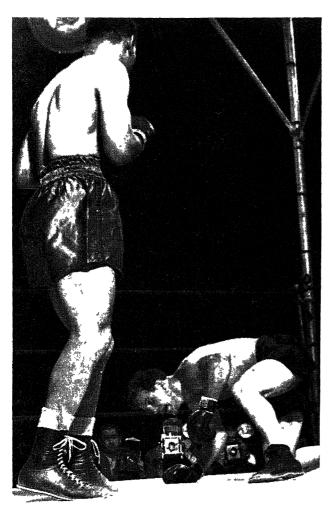

Jacobs' advance was in stride with Louis' activities and gradually underwent expansion until, as president and promoter of the Twentieth Century Sporting club, New York, he established himself as the leading boxing promoter of the world; beyond question the most successful promoter in all boxing history. It was recognized that he even surpassed the legendary George Lewis (Tex) Rickard, whose promotional daring Jacobs shared and to whose position in boxing he succeeded.

Jacobs broke the monopoly of Madison Square Garden, New York, on heavyweight title bouts, and Louis was the instrument of his success in this situation as well as in boxing generally. Braddock, under contract to Madison Square Garden after having succeeded Max Baer as champion in 1935, was scheduled to defend the title against Max Schmeling. of Germany, a former champion, in 1937, but withdrew from this bout and elected instead to defend against Louis. Jacobs had Louis under exclusive contract. When Louis knocked out Braddock, Jacobs gained exclusive rights to heavyweight title defenses and promoted championship matches in the various large boxing centres of the country, such as Chicago, Detroit, St. Louis, Boston, Los Angeles, Philadelphia and Washington.

In all, Louis made 23 defenses of the title during 1937–46, all of them under Jacobs' promotion by an arrangement mutually advantageous. Louis' ring earnings under Jacobs' aegis were conservatively estimated at more than \$3,000,000. No figures were available on Jacobs' earnings through Louis' championship bouts or the many others he conducted in the various divisions of boxing. It was of record Jacobs had never had a losing venture in boxing.

Louis stood out pre-eminently in a decade which saw four years of war cast its blight on boxing. The sport continued through the war, despite the absence of all eligible ring champions who entered service. The action on the home front was necessarily of a comparatively mediocre calibre, conducted with official sanction for purposes of morale. Boxing, too, was a conspicuous part of army and navy training programs, and its influence as a competitive outlet for emotions and as a spectator sport in home camps as well as behind the actual battle lines was recognized and lauded by officers in all branches of service.

Louis and Conn were among prominent boxers who entered service. More than 300 others were in the army, the navy, the marine corps, the coast guard or the merchant

Joe Louis waiting for Billy Conn to rise from the canvas during the fourth of an eight-round fight at Yankee stadium, N.Y., on June 19, 1946. Louis won by a knockout in his 22nd title defense bout

marine. Barney Ross, whose reign as world welterweight champion ended in 1938, emerged from the war with high military honours earned as a marine at Guadalcanal. He was but one of many boxers who distinguished themselves in actual combat.

Rivaling Louis in prominence within the 1937-46 period was Henry Armstrong, Los Angeles, Calif. He distinguished himself as the only boxer in all ring history to hold three championships at one time. He first won the featherweight title in 1937. The following year he won both the welterweight championship and lightweight championship titles, in that order. This created a situation unparalleled. The consequence was confusion almost beyond description. It being not only boxing tradition but established custom that a champion should risk his title whenever a challenger entered the ring at or below the prescribed weight for the class involved, the question developed over championship succession in the event Armstrong, risking his featherweight title, was beaten by a challenger. Obviously, with a challenger at the prescribed 126 pounds for the featherweight class, the division maximum, he would also be "at or under" the 135-lb. maximum for the lightweight division, as well as for the welterweight division (147 lb.). Logically, a successful challenger would have a valid claim on all three titles in the event of victory (see below).

To solve the problem, Armstrong resigned his featherweight title in 1938. He lost his lightweight title in 1939. He went into eclipse as a competitor after losing his welterweight title in 1940. Regulating bodies in boxing throughout the United States, to avoid duplication of such a confusing situation in the future, adopted restraining legislation, depriving a champion of the privilege of competing for a title in the next higher class or classes, without first relinquishing all claim to the other championship.

From time to time, however, confusion surrounded some of the other boxing championships. This grew out of rivalries among regulating bodies. Where a champion resigned his title or retired, one governing body would approve what it considered a satisfactory match among outstanding title contenders for the express purpose of establishing a class leader, only to have another administrative faction dissent. Such confusion, however, never attached to Louis' heavyweight championship.

Louis' Amazing Record.—Louis three times shared the distinction of defending his title before a \$1,000,000 crowd. He also fought before the crowd which paid the highest sum ever to see a ring title event, on boxoffice standards. More, he was a principal in the fight which drew the second largest gate receipts of ring history. This was the bout held June 19, 1946, when he fought Conn for the second time. Louis knocked out Conn in eight rounds of a struggle that was disappointing because Conn was tremendously over-matched. He had come back from war's, duties shorn of much of his ring ability, unlike Louis, who, for all practical purposes, was sharp, well-conditioned, punching as hard and as accurately as of yore. Following his knockout, Conn announced his retirement from boxing.

A crowd of 45,266 persons saw this battle, paying as high as \$100 a ticket for ringside and other desirable seats in Yankee stadium, New York city. The receipts amounted to \$1,925,564, a figure second only to the history-making 'gate" of \$2,658,660 at the second meeting between Jack Dempsey and Gene Tunney in Chicago in 1927. For knocking out Conn in eight rounds, Louis received in excess of \$600,000. Conn's purse exceeded \$300,000. In each instance it was the largest purse the boxer ever collected.

Louis had knocked out Conn in 13 rounds of a battle held at the Polo Grounds June 18, 1941, when 60,071 persons paid receipts of \$451,743 to see the spectacle before the two went off to war. In this bout Conn thrilled the crowd by staggering Louis with a right hand punch to the jaw late in the 12th round. This picture lived in the memories of onlookers and with those who read of or heard the bout broadcast. Their postwar meeting, therefore, was eagerly awaited. The consequence found promoter Jacobs swamped with applications for choice seats immediately after he announced the signing of the return match. In a few weeks Jacobs had applications from 38 states and others from foreign countries, enclosing signed checks with instructions for the promoter to fill in the amount for the tickets sought. At the time Jacobs had not adopted a price schedule. Newspapers speculated, however, on the \$100 charge and it was with this possibility in mind that the applications were forwarded. Jacobs, therefore, decided upon this price.

Louis' other \$1,000,000 gates came when he knocked out Max Baer in four rounds in 1935 and Max Schmeling in one round in 1938. The Baer bout attracted receipts of \$1,000,832 and the Schmeling match \$1,015,012.

Until the advent of Louis, it had been more or less the custom for a heavyweight champion to confine his activities to one bout a year, if he fought that often. Louis shattered this precedent, however, when, following his triumph over Braddock in 1937, he came back to the ring in September of that year to win a 15-round decision over Tommy Farr in New York. In 1938 he made three title defenses, knocking out, successively, Nathan Mann in three rounds in New York, Harry Thomas in five rounds in Chicago, and Schmeling, in the bout that drew a gate of \$1,015,012, in New York.

Through 1939, Louis defended his title four times. He knocked out John Henry Lewis in one round in New York, Jack Roper in one round in Los Angeles, Calif., Tony Galento in 4 rounds in New York and Bob Pastor in 11 rounds in Detroit. Four more title defenses came in 1940, starting with a 15-round decision Louis won over Arturo Godoy in New York. This was followed by a two-round knockout over Johnny Paycheck in New York, a knockout in eight rounds over Godoy in New York and a six-round knockout over Al McCoy in Boston.

Louis had his busiest year in 1941. He defended the heavyweight title seven times, knocking out as many rivals. He started the year with a five-round knockout over Clarence (Red) Burman, in New York, followed this with a two-round knockout over Gus Dorazio in Philadelphia and knocked out Abe Simon in 13 rounds in Detroit. A month later he knocked out Tony Musto in nine rounds in St. Louis, and followed this with a seven-round victory over Buddy Baer in Washington, D.C.; Baer was disqualified after being rendered helpless. This was followed by the 13-round knockout of Conn; in an exhibition bout a month later Louis knocked out Jim Robinson in Minneapolis. Lou Nova was Louis' seventh legitimate challenger, and Louis knocked him out in six rounds in New York.

On Jan. 9, 1942, Louis knocked out Buddy Baer in one round of a bout in Madison Square Garden, New York, donating his entire purse to the Naval Relief fund. On March 27, Louis knocked out Abe Simon in six rounds in Madison Square Garden, donating his entire purse to the Army Relief fund. That was his last fight before joining the army.

Titles in Dispute.—The light-heavyweight championship title was in dispute from 1935 until 1939 following the surrender of the title by John Henry Lewis to enter the heavyweight class. Billy Conn succeeded to the championship Sept. 25, 1939, when he won a 15-round decision over Melio Bettina in Madison Square Garden. Conn, however, resigned the title to enter the heavyweight class June 4, 1941, a procedure upon which the New York State Athletic commission insisted before agreeing to sanction a heavyweight title bout between Conn and Louis. Anton Christoforidis and Melio Bettina fought in Cleveland, O., June 12, 1941, and when Christoforidis received the decision after 15 rounds he was recognized by the National Boxing association as champion. However, universal recognition to a titleholder did not develop until later that year, when Gus Lesnevich won a 15-round decision over Christoforidis in Madison Square Garden.

Lesnevich defended the title against Tami Mauriello Aug. 26, 1941, and won a 15-round decision. Lesnevich shortly afterward entered the service. He did not again defend the title until May 14, 1946, when, following his discharge, he knocked out Freddie Mills, British champion, in ten rounds at London. A crowd of 12,000 saw this first postwar invasion of England by a U.S. fighter. The receipts amounted to \$176,000, creating a record for Great Britain.

The absence of a working agreement between the National Boxing association and the New York State Athletic commission resulted in confusion attending possession of the world middleweight title through most of the 1937–46 span. The situation was not clarified until Nov. 28, 1941,

when Tony Zale fought his way to universal recognition as title-holder, two months before he enlisted in the navy, where he served through the war. Confusion involving the title dated back to the retirement of Mickey Walker from the class in 1931. It developed into the most involved situation to affect any ring division. Fred Apostoli defeated Marcel Thil, French boxer who entered the picture with a title claim, on Sept. 23, 1937, in a ten-round bout in New York. However, because of an "agreement" effected prior to the bout, Apostoli made no claim for championship recognition. Apostoli, Babe Risko and Freddy Steele entered claims for the title and separately received recognition in different sections of the country. However, it was not until July 26, 1938, when Al Hostak knocked out Steele in one round of a bout in Seattle, Wash., that the way was paved for a solution to the problem. This victory brought Hostak the recognition of the National Boxing association, since Steele had entered the bout as the recognized N.B.A. champion. On Nov. 1, Solly Krieger won a 15-round decision over Hostak in Seattle, Wash., and on June 27, 1939, Hostak regained the N.B.A. title distinction when he knocked out Krieger in four rounds of a return bout at Seattle. On Jan. 29, 1940, Zale won a ten-round decision over Hostak in Chicago, to become the N.B.A. champion.

Meanwhile, the New York State Athletic commission held aloof from these "championship" matches. The regulating body based its indifference upon Steele's refusal to give Apostoli a chance at the title in 1938, following a knockout victory Apostoli scored in nine rounds over Steele on Jan. 7, 1938, in a bout held in New York in which the title was not involved because, by arrangement, Apostoli weighed in excess of the 160-pound class maximum. The New York commission granted Apostoli recognition as title-holder. Apostoli lost this recognition when he was knocked out in seven rounds of a bout in Madison Square Garden by Ceferino Garcia on Oct. 2, 1939. Ken Overlin defeated Garcia on decision in 15 rounds in New York city, May 24, 1940, succeeding to Garcia's distinction as the recognized champion of New York's State Athletic commission. On May 9, 1941, Billy Soose defeated Overlin on decision in 15 rounds in New York, but surrendered his New York title claim that year, because he could no longer fight at or under 160 pounds. A match then was arranged between Zale and Georgie Abrams, the winner to be recognized universally as champion; on Nov. 28, 1941, Zale won a 15-round decision over Abrams and thus became undisputed champion of the class. He enlisted in the navy without defending the title, although on Feb. 13, 1942, he lost a 15-round decision to Billy Conn in a match at catchweights.

Zale served with distinction through the four years of war and emerged equipped to resume his ring career. He engaged in half a dozen inconsequential matches to accustom himself again to boxing requirements, and on Sept. 27, 1946, knocked out Rocky Graziano in the sixth round of a scheduled 15-round bout in New York city, providing in his first defense of the 160-lb. championship one of the most spectacular and exciting championship matches in the history of the middleweight division.

Armstrong's Three Championships.—Singularly untouched by doubt, confusion or complications of any kind was the welterweight division. In the period of 1937–46, this class saw no less than four transfers of the championship title. Barney Ross was a hold-over title-holder from 1935 as the period began. He led the class until May 31, 1938, when Henry Armstrong defeated him on a deci-

sion in 15 rounds at Long Island City. This was the second championship Armstrong captured in his unprecedented distinction as the only boxer ever to hold three ring championships at one time. He had previously annexed the world featherweight title.

On Aug. 17, 1938, Armstrong won a 15-round decision over Lou Ambers to gain the world lightweight championship and become a triple crown bearer. He vacated his featherweight title that year and the following year lost his world lightweight title back to Ambers in a bout in New York in which it was expressly agreed that Armstrong's welterweight title would not be involved. The necessity of Armstrong's reducing to 135 pounds to make the lightweight class maximum led to this agreement.

Armstrong held the welterweight title for more than two years, through 18 defenses, 14 of which were knockout victories. He defended the title in New York city, Los Angeles, Havana, Cuba; St. Louis, London, Eng.; Des Moines, Minneapolis, Seattle, Denver, Cleveland, Boston, Washington, D.C., and Portland, Me., in the greatest illustration of welterweight championship activity the class had ever known. Not all of his opponents were dangerous challengers. Yet the fact remained that Armstrong placed his title in jeopardy every time he entered a ring with a foeman at 147 lb. or under.

Looking for more worlds to conquer after he had surrendered his world featherweight title in 1938 and following his loss of the world lightweight title in 1939 to Lou Ambers, from whom he had won the honour the previous year, Armstrong, as world welterweight title-holder, made a bid for the world middleweight championship at the time Ceferino Garcia was recognized as champion by the New York State Athletic commission. They fought ten rounds on March 1, 1940, in Los Angeles, and the decision was declared a draw, enabling Garcia to retain his championship rating unquestioned with the New York State Athletic commission.

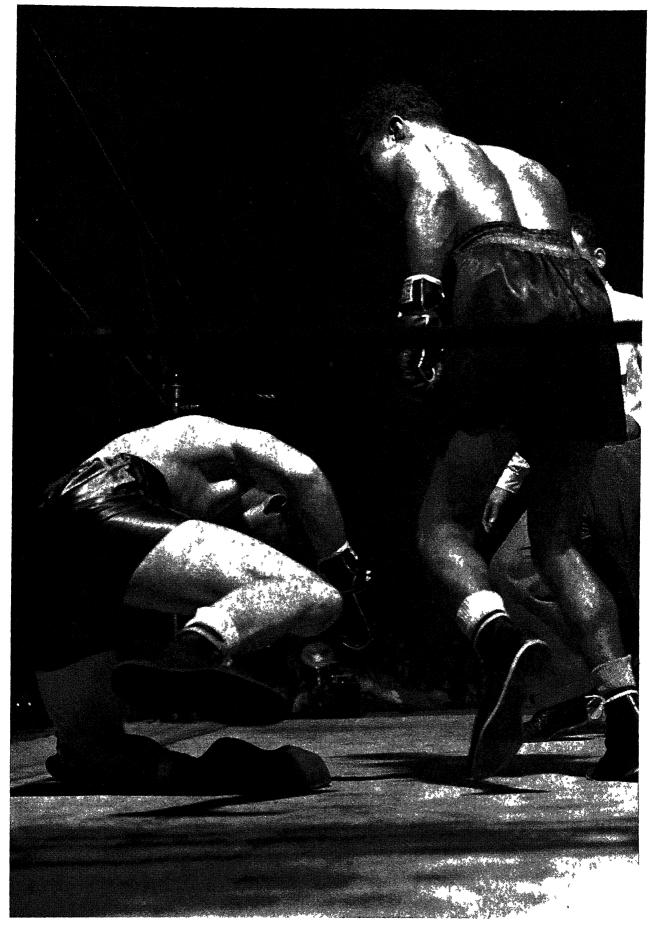

Armstrong had defeated Garcia Nov. 25, 1938, in New York city, in his first defense of the welterweight title after winning the honour from Ross. They fought 15 rounds, and Armstrong won the decision. Others against whom Armstrong defended his title were Baby Arizmendi, over whom Armstrong won a ten-round decision in Los Angeles, Calif., Jan. 10, 1939. This bout launched the most active year of Armstrong's amazing career. He followed the Garcia championship bout with no fewer than ten other bouts. Within the month of October alone he fought five times in as many different cities. Following the January bout, Armstrong knocked out Bobby Pacho in four rounds at Havana, Cuba, March 4; knocked out Lew Feldman in one round at St. Louis, March 16; knocked out Davey Day in 12 rounds at New York city, March 31; won a 15-round decision over Ernie Roderick, English champion, at London, Eng., May 25; knocked out Al Manfredo in four rounds at Des Moines, Ia., Oct. 9; knocked out Howard Scott in two rounds at Minneapolis, Oct. 13; knocked out Richie Fontaine in three rounds at Seattle, Oct. 20; won a ten-round decision over Jimmy Garrison at Los Angeles, Oct. 24; knocked out Bobby Pacho in four rounds at Denver, Oct. 30; and knocked out Jimmy Garrison in seven rounds at Cleveland, Dec. 11.

In 1940, Armstrong waded through six successive knockout victories before finally losing his title. On Jan. 4 at St. Louis, he knocked out Joe Ghnouly in five rounds; on Jan. 24 he knocked out Pedro Montanez in nine rounds at New York City; April 26 he knocked out Paul Junior in seven rounds at Boston; May 24, he knocked out Ralph Zanelli in five rounds at Boston; June 21, he knocked out Paul Junior again, this time at Portland, Me., the bout ending in the third round; Sept. 23, he knocked out Phil Furr in four rounds at Washington, D.C. It was on Oct. 4, 1940, that Armstrong relinquished the welterweight championship throne. He lost a 15-round decision to Fritzie Zivic in New York city. When Armstrong tried to regain the title on Jan. 17, 1941, Zivic knocked him out in 12 rounds at New York city. Despite the loss of his title, Armstrong fought on through 1942, 1943, 1944 and part of 1945. He engaged in 49 bouts as ex-champion, losing but seven of these, before retiring.

Zivic held the title only nine months. On July 29, 1941, Freddie (Red) Cochrane scored an upset victory, winning a decision over Zivic in 15 rounds at Ruppert stadium, Newark, N.J. Before he had a chance to make a title defense, Cochrane enlisted in the navy in 1942. He received his honourable discharge in 1944 and in 1945 engaged in nine non-championship bouts. Twice he was knocked out by the middleweight, Rocky Graziano. Each time the knockout came in the tenth round, at a time when Cochrane appeared on the road to a decision. In his first defense of the welterweight title, Cochrane was knocked out in four rounds by Marty Servo in New York city on Feb. 1, 1946. Servo, victim of a deviated septum, shortly afterward voluntarily surrendered the title when matched with Ray Robinson, undisputed challenger and regarded generally as the "uncrowned champion." This led to general approval of a bout between Robinson and Tommy Bell as a recognized welterweight title match, since the two stood out above other contenders. Robinson defeated Bell for the championship by outpointing Bell in a 15-round match at New York city on Dec. 20, 1946.

Other Disputed Classes.—The world lightweight championship became a disputed distinction in the 1937–46 period. Lou Ambers had become champion on Sept. 4, 1936, when he won a 15-round decision over Tony Canzoneri. On Aug. 17, 1938, Ambers lost the title to Armstrong, but in a return bout, Aug. 22, 1939, regained the title by winning a 15-round decision in New York city. Ambers held the title until May 10, 1940, when Lew Jenkins knocked him out in three rounds of a bout in New York city. In his first defense of the title, on Dec. 19, 1941, in New York city, Jenkins lost a 15-round decision which carried the championship to Sammy Angott. Then confusion developed.

Angott announced his retirement on Nov. 13, 1942, without making a defense. The announcement precipitated a mad scramble to establish a champion. The situation was complicated on Jan. 3, 1943, when Angott, reconsidering his retirement, announced his return to the ring. Automatically his retirement had vacated the title; when he returned and tried to claim championship rating, it was to find the New York State Athletic commission advanced on a tournament to determine a champion. Beau Jack was recognized as outstanding challenger for the title and a bout was arranged between Jack and Bob Montgomery with the commission's championship endorsement, May 21, 1943. Montgomery won this bout and the title on a 15round decision. Jack came back to win a decision over Montgomery in 15 rounds Nov. 19, 1943, and regain the title. On March 3, 1944, Montgomery won a 15-round decision over Jack, which carried the title with it, as far as

New York was concerned. Late in 1944 Montgomery went off to war as champion. He resumed ring operations early in 1945, however, but the title situation had not been cleared at the end of 1946.

Upon Angott's return to the ring, the National Boxing association recognized a bout between him and Juan Zurita as a title match. This was held March 8, 1944, in Hollywood, Calif., and Zurita won a decision in 15 rounds, and recognition by the N.B.A. as world champion. April 18, 1945, Ike Williams knocked out Zurita in two rounds of a bout in Mexico City, to become champion. Efforts were made during 1946 to arrange a bout between Montgomery and Williams which would produce an undisputed champion, but no immediate success attended the attempt.

Armstrong's retirement as world featherweight champion in 1938 threw the 126-lb. division into similar confusion. A succession of boxers, including Mike Belloise, Joey Archibald, Harry Jeffra, Chalky Wright, Petey Scalzo, Richie Lemos, Jackie Wilson, Jackie Callura, Phil Terranova, Willie Pep and Sal Bartolo, all vied for the title in a bewildering succession of matches which served no purpose other than to keep these boxers in semi-championship prominence. The situation was not remedied until June 7, 1946, when Pep, as the recognized champion of the New York State Athletic commission, and Bartolo, the National Boxing association's champion, engaged in a scheduled 15-round bout in New York city. Pep knocked out Bartolo in 12 rounds to become universal title-holder.

Similarly, the world bantamweight championship became shrouded in confusion. Harry Jeffra won the title Sept. 23, 1937, by outpointing Sixto Escobar at New York city in 15 rounds. On Feb. 20, 1938, Escobar won a 15round decision over Jeffra at Puerto Rico, to regain the title. Escobar defended the title in 15 rounds against Kayo Morgan at Puerto Rico, April 2, 1939, winning a decision. Late that year, however, Escobar surrendered the title when he outgrew the class. This left the 118-lb. class leaderless. Georgie Pace, Lou Salica and Tommy Forte were generally accepted as outstanding contenders for the title. Salica, as New York State's recognized champion, won a 15-round decision over Pace, the N.B.A. champion, in New York city, on Sept. 24, 1940. On Jan. 13, 1941, Salica won a 15-round decision over Forte in Philadelphia, to gain universal recognition. On Aug. 7, 1942, Manuel Ortiz won a 12-round decision over Salica in Hollywood, Calif., to become champion.

Ortiz, in 1943, defended the title seven times, defeating Kenny Lindsey at Portland, Ore., Jan. 1; Georgie Frietas, at Oakland, Calif., on Jan. 27; Salica, at Oakland, Calif., on March 10; Joe Robleto, at Long Beach, Calif., May 26; Robleto again, July 12, at Seattle, Wash.; Leonardo Lopez, at Hollywood, Calif., Oct. 1, and Benny Goldberg, at Los Angeles, Nov. 23. In 1944, Ortiz retained the title against Ernesto Aguilar, at Los Angeles, March 14; against Tony Olivera, at Los Angeles, April 4, and against Lou Castillo, at Los Angeles, Nov. 14. A dearth of worth-while competition, coupled with a short service in the army, kept Ortiz out of title combat in 1945. But in 1946 he retained the title in three bouts, knocking out Castillo in 13 rounds at San Francisco, Feb. 25; Lindsey in five rounds at Hollywood, May 25, and Jackie Jurich in 11 rounds at San Francisco, June 10.

The chaos attending the retirement in 1927 of Fidel LaBarba as world flyweight champion had its echo in the confusion which attached to this once popular class through the 1937-46 period. Great Britain cornered the market on 112-lb. boxers. American flyweights were almost nonexistent. Benny Lynch, an English boxer, gained recognition as world champion Jan. 9, 1937, when he won a 15-round decision over the Filipino, Small Montana, in London, Eng. But in the following year Lynch had outgrown the class, and a 15-round bout in Liverpool, Eng.,

Boxing Champions, 1937-1946

Light heavyweight

1935–39—John Henry Lewis* 1939 —Melio Bettina 1939-41-Billy Conn* 1941-46-Gus Lesnevich

*Abandoned title.

Welterweight

1935-38-Barney Ross 1938–40—Henry Armstrong 1940–41—Fritzie Zivic 1941–46—Freddie Cochrane 1946 —Marty Servo*, Ray Robinson *Retired.

Middleweight

1932-37-Marcel Thil* -Al Hostak and Solly Krieger (N.B.A.) 1938 -Solly Krieger, Al Hostak (N.B.A.); Ceferino Garcia 1939 (N.Y. comm.) -Tony Zale (N.B.A.); Ken Overlin (N.Y. comm.) 1940 1941 -Tony Zale (N.B.A.); Billy Soose (N.Y. comm.)+ 1941-46-Tony Zale

*Thil's international title disputed although his victory over Jones on a foul gave him clear claim. The N. Y. comm. and N.B.A. held elimination tourneys, Hostak emerging as N.B.A. champion and Garcia as N. Y. titleholder.

†Soose abandoned claim to title and Zale became undisputed ruler by defeating Georgie Abrams, who had beaten Soose three times.

Heavyweight

1937-1946-Joe Louis

Lightweight

1936-38-Lou Ambers 1938-39-Henry Armstrong 1939-40-Lou Ambers 1940-41-Lew Jenkins 1941-42-Sammy Angott*

-Beau Jack, Bob Montgomery (N. Y. comm.); Sammy Angott (N.B.A.).

-Beau Jack, Bob Montgomery (N.Y. comm.), Sammy 1944 Angott, Juan Zurita (N.B.A.).

-Bob Montgomery (N. Y. comm.), Juan Zurita, Ike Williams (N.B.A.). 1945

-Bob Montgomery (N. Y. comm.), Ike Williams

(N.B.A.).

*Angott announced his retirement on Nov. 13, 1942, leaving title vacant, but approximately two months later announced his comeback as challenger for the title.

Featherweight

1936-37—Petey Sarron 1937-38—Henry Armstrong* 1938–40—Joey Archibald 1940–41—Harry Jeffra, Joey Archibald 1941–42—Chalky Wright 1942-46-Willie Pep *Abandoned title.

Flyweight

1935–38—Benny Lynch* 1939 —Peter Kane† 1943-46-Jackie Paterson *Retired. †Abandoned title.

Bantamweight

1936–37—Sixto Escobar 1937–38—Harry Jeffra 1938–40—Sixto Escobar* 1940–42—Lou Salica 1942–46—Manuel Ortiz *Retired.

Sept. 22, 1938, between Peter Kane, English boxer, and Jackie Jurich, of the U.S., was recognized as a world championship, despite the fact Jurich's claim to U.S. supremacy was clouded. Kane won the bout and was recognized as champion. But Kane also outgrew the class and the title was generally regarded as vacant until June 19, 1942, when Kane returned to the ring, was knocked out in one round of a bout with J. Paterson at Glasgow, Scotland. Paterson, a native of Glasgow, Scotland, succeeded to a world title he held as 1946 drew to a close. He solidified his claim on July 10, 1946, by winning a 15-round decision over Joe Curran, English flyweight, at Glasgow.

The Sport in Europe.—Few important outstanding professional boxing contests took place during 1937–46, although boxing generally had become more popular with the public and the standard of boxing had improved in speed and action, if not in science.

In 1946 Great Britain had at long last found an outstanding heavyweight in Bruce Woodcock to match against Joe Louis, the U.S. world heavyweight champion. France had provided a good middleweight in Marcel Cerdan. Sweden had a good heavyweight in Olle Tandberg.

World War II had hindered the production of leading professional boxers and, through it, many outstanding young boxers had been lost.

In 1937, Great Britain was endeavouring to arrange working agreements with a continental body known as the International Boxing union; in addition, a great deal of work was carried out by lovers of the sport to bring about boxing unity within the British empire. Further, an attempt was made to secure a proper understanding between the boxing authorities of Europe and the boxing authorities of the U.S.A. In 1938, a meeting was held in Rome, Italy, at which every European country, including Great Britain, together with representatives from America, met for the purpose of formulating a world's boxing commission. It was decided to appoint officers for the new association, but after U.S. representatives had returned to their own country no further action was taken.

It therefore appeared prior to World War II that no uniform working and no international sports agreements were possible. This position, however, had been greatly improved by the fact that during the war many nations had been represented in Great Britain by their serving soldiers who in their spare time had continued to box. This applied to all Allied forces, with the exception that U.S.' professional boxers were debarred by their services from taking part in such contests. Wartime international boxing together with the intermixing of the many nationals went far to break down the barrier of misunderstanding, with the result that, after the end of the war, a new federation, the European Boxing association, was formed, in which Great Britain, France, Belgium, Switzerland, Italy, Holland, Greece, Austria, Luxembourg, Sweden, Spain, Portugal and Czechoslovakia became members.

The British dominions were already in conversation with the British Boxing Board of Control at the end of 1946, with a view to forming an empire association, and the United States had appointed a co-ordinator for Europe and was ready to discuss the formation of a world's championship committee. Bracken, John

Bracken (1883—), Canadian politician, was born June 22, 1883, at Ellisville, Ont. He was graduated from the Ontario Agricultural college and after completing his studies worked as a seed inspector for the Canadian government. In 1910, he joined the University of Saskatchewan in Saskatoon, Sask. as professor of field husbandry and later became president of the Agricultural College of Manitoba. In 1922 he accepted leadership of the newly formed Agrarian or Progressive party of Manitoba and that year was elected to the Manitoba legislature; he was re-elected in 1927, 1932, 1936 and 1940.

In 1932, Bracken headed a provincial government of Progressives and Liberals; and later the coalition was extended to include representatives of four other parties. Bracken emerged as a national figure in Dec. 1942, when he was chosen national leader of the Conservative party, whose name was later changed at his request to Progressive Conservatives. In Oct. 1944, he accepted nomination for the house of commons for Neepawa, Manitoba, in the general elections. He was returned in June 1945 and became the official leader for the opposition in the house of commons. During the draft riots in Quebec, Bracken demanded, March 2, 1945, creation of a royal commission to investigate the situation.

Braden, Spruille

Braden (1894-), U.S. diplomat, was born March 13, 1894, in Elkhorn, Mont. His father had founded the Braden Copper company which had interests in both North and South America. Braden graduated from the Sheffield Scientific school at Yale university with a degree in mining engineering in 1914. He later worked in executive positions in mining and related fields in South America. After World War I, he engaged in various financial and business enterprises, and also acted as adviser to Latin American governments on loan negotiations. In 1933, he entered the diplomatic service as delegate to the Inter-American Conference of American States in Montevideo. Later he became chairman of the U.S. delegation to the Chaco peace conference 1935-39. He was U.S. ambassador to Colombia, 1939-41. Shortly after Pearl Harbor, he was named U.S. ambassador to Cuba.

In April 1945, President Truman named Braden as ambassador to Argentina. In this post, Braden denounced fascism and actively campaigned for establishment of democracy in Argentina. This policy displeased Col. Juan Domingo Perón, then war minister, who countered with personal attacks on Braden and denunciations of "dollar diplomacy." On Aug. 25, 1945, President Truman announced Braden's appointment as assistant secretary of state in charge of South American republic affairs, succeeding Nelson A. Rockefeller. His appointment was delayed until Oct. 29, 1945, because of senatorial charges that he was "meddling" in Argentine affairs. On Oct. 31, 1946, however, the state department announced that Braden had the entire confidence of both President Truman and Secretary of State James Byrnes and that he would remain in his position.

397

398 Bradley, Omar Nelson

Bradley (1893-), U.S. army officer, was born Feb. 12, 1893, in Clark, Mo., and was graduated from the U.S. military academy at West Point (1915). During World War I, he was stationed on the Mexican border and at training camps in the western United States. After the war, he was graduated from the Infantry school, the Command and General Staff school and the Army War college. Between 1929 and 1941, he served as chief of the infantry's weapons section, commandant at West Point and secretary of the general staff in Washington. In Feb. 1943, he assumed command of the 2nd corps in the North African theatre.

Bradley's skillful campaign in North Africa enhanced his reputation as a strategist and in Jan. 1944 Eisenhower named him commanding general of U.S. ground forces for the invasion of western Europe. Bradley directed the U.S. 12th army group in the landings in Normandy, June 1944. The following August his forces were made independent of the 21st army group headed by Field Marshal Bernard Montgomery, and Bradley was given equal status with Montgomery. Although at the time it was emphasized that the equal status given Bradley implied no criticism of Montgomery, subsequent "post-mortem" reports declared that Eisenhower, pleased with the U.S. break-through at St. Lo, decided to give Bradley that recognition. Under Bradley's guidance, the U.S. forces staged sweeping drives across France and hammered their way into the Siegfried line by the winter of 1944. During the German breakthrough in the Ardennes forest, the 1st and 9th U.S. armies were temporarily shifted to Montgomery's command. Explaining the German counterattack, Bradley declared that the thinness of the U.S. line at the point of the foe's breakthrough resulted from a "calculated risk" in which surplus divisions were concentrated for attack in other sectors. Bradley was raised to the temporary rank of a full general on March 13, 1945. In June of that year, he was named by President Truman as administrator of veterans' affairs, and the following September Bradley announced plans to overhaul the veterans' service for more efficiency. In early 1946, he became involved in a dispute with John Stelle, national commander of the American Legion, who charged that there had been a "tragic breakdown" in the Veterans administration; Bradley brushed off this attack as a "personal" one. Subsequently, President Truman said (Feb. 2) that he backed Bradley "up to the hilt" in this dispute. In later statements, Bradley accused Stelle of obstructing the VA program and of "misrepresenting our objectives."

Brandeis, Louis Dembitz

Brandeis (1856–1941), U.S. jurist, was born Nov. 13, 1856, in Louisville, Ky. Educated in elementary schools in Germany and the United States, he was graduated from Harvard law school in 1877 and practised in Boston, Mass., from 1879 to 1916. Beginning as a corporation lawyer, he later swung toward economic liberalism and won a reputation between 1907 and 1916 as an active foe of monopoly in business. In Jan. 1916, President Woodrow Wilson appointed him associate justice of the supreme court—the first Jew to attain this position. Justice Brandeis established a record as a militant liberal in the high court, and he frequently joined Oliver Wendell Holmes in dissenting opinions. He upheld the minimum wage law for women and was the author of a frequently cited majority opinion in which he defended

labour's right to picket but not to intimidate.

Of 16 major New Deal laws brought before the supreme court, Justice Brandeis sided with the administration in 10 instances, but in 1935 he voted against the National Recovery act, which aroused his dislike for "bigness." He resigned from the court in Feb. 1939 because of age and failing health and resumed an active role in the Zionist movement. He died in Washington, D.C., Oct. 5, 1941.

Brauchitsch, Walter von

Brauchitsch (1881–), German army officer, was born Oct. 4, 1881, in Berlin. The son of a cavalry general, he was educated in a military academy and became a lieutenant in 1900. He served during World War I as an officer on the German general staff and in 1933, he succeeded Marshal Werner von Blomberg as commander of the East Prussian army district, which later was transformed into the 1st army corps. In Feb. 1938, following Hitler's "purge" of the army, Brauchitsch succeeded Gen. Werner von Fritsch as commander in chief of the German army. He personally directed the wehrmacht campaigns in Poland, the Low Countries and France, and Hitler raised him to the rank of a field marshal on July 19, 1940. The following year, Brauchitsch supervised German army operations in the Balkans, Crete and in the soviet union. Following the failure of the nazi armies to capture Moscow, Hitler announced Brauchitsch's removal on Dec. 21, 1941; answering an "inner call," Hitler himself assumed the post of commander in chief. London dispatches in Dec. 1942 said that Hitler had summoned Brauchitsch back to Berlin for consultations but did not reinstate him. After his ouster, Brauchitsch was not prominent in the news until Aug. 19, 1944, when he wrote an article in Volkischer Beobachter saying that he agreed "heart and soul" with Hitler's appointment of Heinrich Himmler as commander of the German home army.

Brazil

A republic in eastern and central South America, Brazil is the most populous Latin country in the world. Language: Portuguese; religion: predominantly Roman Catholic, with about 500,000 Protestants of various denominations. President: until Oct. 29, 1945, Getulio Vargas (from 1930); from then to Jan. 31, 1946, José Linhares, former chief justice; after that date, Gen. Eurico Gaspar Dutra (constitutional term to expire in 1952).

Brazil has an area of 3,286,140 sq.mi. (8,337,218 sq.km.), second only to Canada in size in the western hemisphere. It occupies nearly half the South American continent, extending approximately 2,600 mi. north and south, with a maximum width of nearly 2,700 mi. It has a coast line of more than 4,900 mi., and is bordered on the north by Venezuela and the Guianas, on the west by Colombia, Peru, Bolivia, Paraguay and Argentina, and on the south by Uruguay. Geographically the country may be divided into five regions: the lowlands, drained by the Amazon and its tributaries; the La Plata river basin; the Guiana highlands; the Brazilian highlands; and the coastal plain. The Amazon and La Plata basins together constitute about three-fifths of the total area. Politically the country is divided into 20 states, a federal district and 7 territories, including the island of Fernando de Noronha, 225 mi. off the coast.

The population (1940 census: 41,565,083) was estimated at 45,300,000 as of Jan. 1, 1945. The population was classi-

fied as 22% urban, 9% suburban and 69% rural. The capital, Rio de Janeiro (coterminous with the federal district), is the largest city in Brazil, the fifth in size in the western hemisphere and the third largest Latin city in the world. It had a population of 1,776,369 in 1940, and an estimated population of 1,941,700 in 1945.

The greatest density of population is to be found in the states of São Paulo (75.8 per sq.mi. in 1940), Sergipe (65.6), Santa Catarina (32.3) and Rio Grande do Sul (31.9). The least densely populated states are Amazonas, Goiaz and Mato Grosso, and the territory of Ponta Porã. The density of population for the whole country as of Sept. 1, 1940, was 12.6 per sq.mi. The largest states in terms of population are: São Paulo (7,239,711 inhabitants, 1940), Minas Gerais (6,798,647) and Bahia (3,938,909). Brazil's hypothetical centre of population falls in the east south central part of Minas Gerais, not far from Belo Horizonte. Other important cities, besides Rio de Janeiro: São Paulo (1,308,-925 in 1940), Recife (347,558), Salvador (290,937), Porto Alegre (274,935), Belo Horizonte (210,350), Belém (208,-937), Fortaleza (174,051), Niteroi (142,531), Curitiba (141, 658) and Manaus (107,191).

Official statistical data offered no basis for determining the relative proportions of Negroes, Indians, whites and their mixtures. The following is a rough estimate: whites, 46%; Negroes, 30%; Indians, 24%. The whites predominate in the states of Santa Catarina, Paraná, Rio Grande do Sul and São Paulo; the Indian elements are of greatest relative importance in the Amazon basin, including the states of Pará and Amazonas and the territory of Acre, northern Goiaz and western Maranhão. The Negroid type predominates in the states of Bahia, Rio de Janeiro and Minas Gerais.

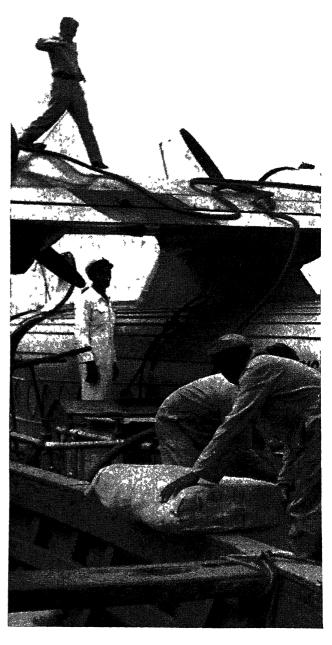

Immigration was controlled under provisions of the 1934 constitution, continued by the 1937 constitution. A presidential decree-law of Sept. 18, 1945, set up an immigration quota system on a yearly basis equal to 2% of the number of foreigners from each country who entered Brazil between Jan. 1, 1884, and Dec. 31, 1933. The constitution of 1946 set no limit on immigration. From Jan. 1, 1937, to Dec. 31, 1944, the following immigrants were admitted: 1937, 34,677; 1938, 19,388; 1939, 22,668; 1940, 18,449; 1941, 9,939; 1942, 2,627; 1943, 1,345; 1944, 1,612.

The Vargas Dictatorship.—The period from 1937-45 marked a new (and last) phase of the long dictatorship of Getulio Vargas which began in 1930. Prolonged clashes between leftist and rightist elements led to considerable unrest. The so-called "Communist Revolution" of Nov. 1935 had given Vargas the opportunity to order the arrest of many leftist leaders. A well-organized Fascist party, the Integralistas, led by Plínio Salgado, openly sought to gain control of the government; it was assisted, as later proved, by Italian and German agents. Vargas' constitutional term was to expire in 1938. In preparation for the presidential elections to be held the previous year, a coalition of antigovernment and non-Fascist elements was organized to back Dr. Armando de Salles Oliveira, former governor of the state of São Paulo. Vargas had declared several times that he would not seek re-election. On May 25, 1937, Dr. José Américo de Almeida was nominated as the government party candidate.

However, on Oct. 1, Vargas suddenly proclaimed a goday "state of siege" because of alleged threats of communism, and on Nov. 10, by decree, he dissolved both houses of congress, the state legislatures and all municipal councils. At the same time he promulgated a new constitution (prepared by his minister of justice, Francisco Campos), placing the entire control of the country in the hands of the president. All state and national courts were abolished, including the supreme court, which was replaced by a federal supreme tribunal. The presidential elections were postponed indefinitely. The presidential term was increased to six years, and Vargas was to continue in office until elections were held under the new constitution.

Furthermore Vargas, by decree of Dec. 2, 1937, abolished all political parties, prohibited the wearing of uniforms or other group insignia and denied to army and navy officers the right to join any political group. The *Integralistas*, claiming 1,000,000 members throughout Brazil, were especially affected by these regulations. On May 11, 1938, they staged a revolt in the capital, attacking the presidential palace. Repulsed by troops loyal to Vargas, the whole affair ended within a few hours. More than 1,000 persons

Cargo of Brazilian rubber being loaded into a Pan American clipper at Manaus, on the Amazon, for shipment to the United States during World War II

were arrested, but the Integralist leader was able to flee the country. After the Integralist revolt Vargas pursued with greater firmness his policy of nationalism and centralization.

Support for Allies.—At the outbreak of war in Europe in Sept. 1939 Brazil declared itself unequivocally on the side of the Allied cause, although officially proclaiming its neutrality (Sept. 6, 1939). Vargas' loyalty to the cause of Pan-Americanism was somewhat contradicted by his praise, in a public speech (June 11, 1940) of the axis powers and of totalitarianism. Despite this utterance, relations with the United States continued friendly.

Upon the entry of the United States into active war in Dec. 1941, the Brazilian government reiterated its support of continental solidarity and took measures to place German and Italian news agencies under special censorship and to freeze non-American bank deposits. At the Rio de Janeiro Conference of Foreign Ministers of the American Nations (Jan. 1942), Brazil stood as one of the most consistent supporters of continental solidarity, and severed relations with the axis powers. Special privileges were offered the United States for the establishment of air and naval bases along the Brazilian coast, particularly in the strategic northeastern bulge.

When several Brazilian ships were sunk by axis submarines, President Vargas promptly ordered the seizure of certain percentages of axis-owned assets as compensation. The Brazilian air force was ordered to patrol the coast and to attack any axis submarine encountered. In Aug. 1942 five Brazilian ships, including one loaded transport, were sunk by submarines off the Brazilian coast with heavy loss of life. Popular indignation resulted in a formal declaration of war against Germany and Italy (Aug. 22, 1942).

Brazil at War.—The most immediate military significance of Brazil's entry into the war as a member of the United Nations lay in its effect upon the submarine campaign and the active use of Brazilian bases by the armed forces of the United States and other Allied powers. The effect of Brazil's war declaration upon other nonbelligerent nations was also noteworthy.

Internally, the declaration of war was followed by extensive mobilization measures, including the control of stocks and prices of a number of commodities, rationing of foodstuffs and the combat against subversive activities of axis agents. In Dec. 1943 the Brazilian air force took over full responsibility for the aerial defense of the South Atlantic. Finally, an expeditionary force was sent to the European theatre, landing in Italy on July 16, 1944. The Brazilian unit, under the command of Gen. João Batista Mascarenhas de Morais, took over a section of the front as part of the army of Lt. Gen. Mark Clark and saw service in several engagements, acquitting itself creditably. Two more contingents were sent to Italy in the latter part of the year.

Politically, after a period of comparative calm during which the people put aside its grievances against the dictator, there appeared new signs of unrest. Taking cognizance of this state of affairs, Vargas promised that elections would take place after the war and that he would not seek re-election. On March 28, 1945, he issued a call for national elections to be held on Dec. 2, 1945. At last free from the restraints of censorship (abolished on Feb. 22, 1945) the press violently criticized the Vargas regime. In preparation for the elections, the democratic elements rallied around Air Brigadier Eduardo Gomes, a hero of the 1930 revolution. Vargas countered with two important measures: the announcement of the candidacy of Gen.

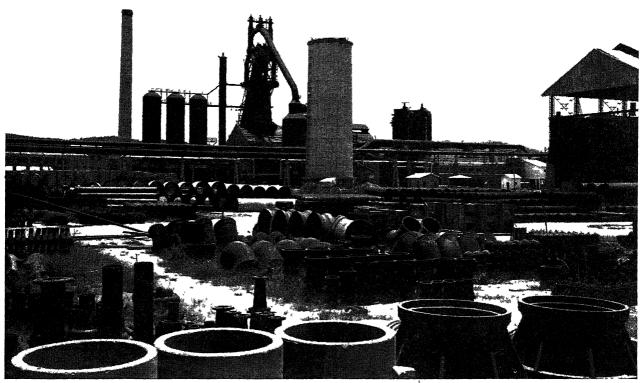

Eurico Gaspar Dutra, his minister of war, and his reconciliation with Communist leader Luis Carlos Prestes (in jail from 1936). This action was followed by the recognition of the soviet union on April 2.

Brazil's inflation during World War II was one of the worst in the western hemisphere. Prices climbed to three and four times prewar levels. The real estate and business boom was believed nearing an unhappy end by the middle of 1946. Many of the banks that had sprung up after 1940 were deeply involved in land speculation. At the end of 1944 the cost of living had risen to alarming heights; the percentage of increase was estimated officially at 250.78%. The blame was often placed on the Vargas regime, which had flooded the country with the equivalent of \$700,000,000 in paper money, or roughly 6 times the amount of money which was in circulation when it came to power in 1930.

External communications by air and by sea were considerably strained and at times even paralyzed by the war. Direct communications with continental Europe ceased in Dec. 1941 when the Italian "Latı" air service between Italy and Brazil (via Dakar) was discontinued as a result of the refusal of American oil companies to supply fuel. The Brazilian government granted permission to Panair do Brasil, a Pan American Airways subsidiary, to improve and construct landing fields in certain areas of Brazil in order to provide air transport north and south. The Panair service to Dakar, in Africa, offered a link with routes to Portugal and other European countries and also maintained a connection through Corumbá to the west coast of South America. The facilities of the former Condor (German) air line to the R10 de la Plata were reorganized at the end of 1942 under government supervision. Brazilian military planes maintained regular mail services over numerous unprofitable routes. Three important Brazilian air lines, the Navegação Aérea Brasileira, S.A. (established in 1941), Empresa de Transportes Aerovias Brasil, S.A. (1942) and Companhia Brasileira de Aviação, S.A. (1942), maintained air services among important cities within the country. On Sept. 10, 1946, an agreement was announced assuring the Pan American Airways the most important internal route in Brazil, from Barreiras to Rio de Janeiro and São Paulo. Two other shorter routes in central Brazil were guaranteed to U.S. aviation interests.

Under the stimulus of the war, the agriculture of Brazil rose to new heights. Besides coffee, cotton and cocoa, the principal export crops, other foodstuffs and raw materials became important during the period. Coffee declined in relative importance as war demands stimulated the production of other materials. Brazil continued, however, to be the world's greatest producer of coffee, accounting for more than half of the western hemisphere's total production. The production of cotton, cacao, sugar and rubber also soared.

Although industrial production continued to be primarily for domestic consumption, it grew sufficiently during the war period so that some manufactured products could be exported. In 1939 a "five-year plan" was adopted, calling for the outlay of some \$50,000,000 annually to develop the basic industries. Among the projects given immediate attention were the development of a Brazilian iron and steel industry. In 1940 an Import-Export bank loan of \$25,000,000 enabled the Brazilian government to put into effect the construction of the iron and steel mills of Volta Redonda. The first production of steel on a regular scale took place on June 23, 1946. The output of Volta Redonda at the end of 1946 was said to be 300,000 tons yearly. The coal utilized in Volta Redonda came

Blast furnace of the Brazilian Volta Redonda iron and steel mills, financed in equal parts by Brazilian capital and a \$25,000,000 loan by the U.S. Export-Import bank. Production began in June 1946 with an estimated annual output of 300,000 tons of steel

from the Santa Catarina state, where it had to be refined before shipment because of its high sulphur content.

From 1938-43 the industrial production of Brazil increased by 50%. In 1943 there were about 80,000 factories employing 1,500,000 persons as against 37,000 factories employing 1,000,000 persons in 1938. In the same period textile output rose 34%, accompanied by a sharp increase in textile exports. The leading industrial products were: foodstuffs, textiles, chemicals and pharmaceutical products, paper and rubber products, clothing, leather, glass and porcelain, metallurgical products. In the first 6 months of 1945 more than 253,000 automobile tires and more than 169,000 tubes were produced. The Firestone Tire company produced in 1946 its millionth tire in its Brazilian branch at Santo André, São Paulo. This plant had been in operation from June 1, 1940, supplying the bulk of Brazilian tires and some for export to other American countries. Geared to produce 104,000 tires a year, the plant could be extended to produce more than 228,000 a year with additional machinery. A goal of more than 2,000,000 tires for 1948 was announced. Plans adopted for further industrialization of the country during the 10year period 1945-55 represented an outlay of at least \$2,500,000,000 and possibly \$4,000,000,000, to be spent mostly in machinery and capital goods.

The first aviation motor entirely manufactured in Brazil was tried in flight on Aug. 20, 1946, near Rio de Janeiro. The plant, owned and operated by the government, initiated the manufacture of aeroplane engines in 1944 with materials received under lend-lease from the United States. A private concern announced plans to build automobiles, tractors, trucks and agricultural machinery in 1946. A large rayon factory, costing some \$18,000,000, was to be constructed in São Paulo state during the same year, backed

by Brazilian capital and operated by the Brazilian Nitro Chemical company.

To keep up with these developments, which placed Brazil at the head of all Latin-American nations so far as industrialization was concerned, the government adopted a vast plan for the development of hydroelectric power in 10 different areas, including the São Francisco valley, where a series of dams were to be constructed along the 1,800-mi. course of that river. In 1946 there were 1,597 electric companies in the country, controlling 1,808 power stations. The total potentiality of these plants was estimated at 1,230,865 kw.

Vargas Out; Dutra In.—Fearing that Vargas intended to perpetuate himself in power, the army occupied strategic points in the capital during the night of Oct. 29–30, 1945, and surrounded the presidential palace. A group of officers then visited Vargas and demanded his resignation. The president complied and transferred his powers to Chief Justice José Linhares in accordance with the 1937 constitution. Linhares pledged himself to hold elections both for president and members of the parliament on the announced date (Dec. 2, 1945) and to help to build up a democratic structure with the assistance of the armed forces.

During the pre-election campaign the following presidential candidates were presented: Yeddo Fiuza (former mayor of Petrópolis) for the Communist party; Gen. Eurico Gaspar Dutra for the Social Democratic party with the backing of sections of the Labour party under Vargas' leadership; Brigadier Eduardo Gomes for the National Democratic union; and Mario Rolim Teles for the National Agrarian party. The Integralist party supported Gen. Dutra's candidacy.

The people responded enthusiastically to the invitation to participate in the first free election in 15 years. More than 7,600,000 people registered. Despite the high hopes of the National Democrats, Gen. Dutra was elected by a

large majority, receiving 3,235,530 votes, as against 2,029,886 for Gomes, 586,523 for Fiuza and 9,991 for Teles. Dutra was declared elected on Jan. 28, 1946, and inaugurated on Jan. 31. Immediately after the inauguration, he announced the selection of his cabinet and other high positions in government. Only the former incumbents in the ministries of war, navy and air were retained.

The parliament met in the capital in early February with a total of 286 deputies and 57 senators. The government's party (Social Democrats) had 150 seats in the house and 26 in the senate. Other important parties represented were: the National Democratic union (84 and 13, respectively); the Brazilian Workers party (23 and 2); and the Brazilian Communist party (14 and 1). The Communist party representative in the senate was the party's leader, Luis Carlos Prestes. Former President Vargas was also elected to the senate as a representative for his native state of Rio Grande do Sul.

The parliament constituted itself as a constituent assembly and decided that the 1937 constitution would remain in effect until the promulgation of a new one. On June 1 the assembly approved the draft of a new constitution and limited the period for the presentation and discussion of amendments (about 5,000 considered) from June 5 to 24. On Sept. 18, 1946, the new constitution was promulgated.

The Constitution of 1946.—In general, the 1946 constitution was more liberal and democratic than the 1937 charter. It provided for a legislative power exercised by a national congress composed of two houses: a federal senate and a federal chamber of deputies. During the interval between legislative sessions a permanent commission was to exercise certain of the legislative powers. The members of the senate were to be elected for a nine-year period, and members of the chamber for a four-year period. Members of congress were to be elected by equal, direct, obligatory and secret suffrage under a system of proportional representation. The president and the vicepresident were to be elected simultaneously by a majority of votes, to hold office for six years. The president might not be re-elected within six years after the expiration of his term of office.

The judiciary was to be composed of a federal supreme court, federal courts of appeals, judges and federal military courts, judges and electoral courts, judges and labour courts and other judges and courts which might be created by law. Each state was to be governed under the constitution adopted by it, within the framework of the federal constitution. Municipalities were so organized as to assure their autonomy.

Section III of the new constitution, on social rights, empowered the federal government to create state-owned monopolies in the public interest. The government was authorized to suppress any organization, group, company or individual regardless of its nature, which endeavoured to dominate internal markets, eliminate competitors or exploit consumers through prices or any other form of oppression. The government was further empowered to proceed with the nationalization of banks, insurance, investment and similar enterprises, eventually forcing foreign companies operating in Brazil out of business, and precluding the entry into the country of new companies desiring to devote themselves to such activities. The nationalization of public utilities was to be regulated by special law. Mines and other subsoil wealth, as well as the waterfalls, were declared property distinct from the soil for the purpose of exploitation or industrial use. Their

exploitation was to be dependent on federal authorization or concession, such concession to be granted only to Brazilians or to firms organized in Brazil and thus assuring to the owner preference in the exploitation or in the participation of profits.

The section on immigration provided for the establishment of a special commission to select and handle all questions relating to the admission of foreigners, and fixed no limit on the number of immigrants that might be admitted in any given period.

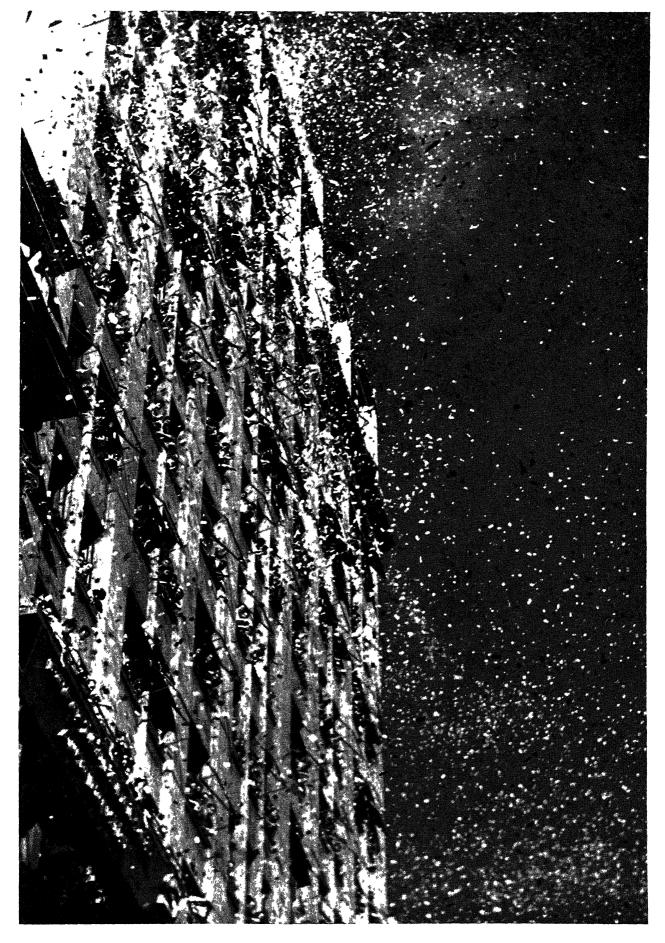

The new constitution also included some of the advanced social stipulations of the 1937 constitution, such as the 8-hour day of work, minimum age for employment (14 years), equal contributions from workers, employers and the government for social security funds, unemployment assistance, compulsory profit-sharing and the establishment of elementary instruction facilities by employers of 100 workers or more where public facilities for such instruction did not exist.

The government was authorized to intervene in labour disputes, but the principle of freedom of association and the right to strike were recognized, with certain limitations deemed necessary in the public interest. Labour courts were to be created for the solution of controversies between workers and employers. The ownership of journalistic enterprises and broadcasting stations was prohibited to corporations with shares represented by bearer certificates and to foreigners.

Both the federal and state governments were made responsible for public education. The constitution provided that a minimum of 10% of federal revenues should be devoted to educational purposes, and the states were required to devote at least 20% of their revenues to the same purpose. Academic freedom was assured, and although religious instruction was to be included in the curriculum of public schools, the students could indicate the sectarian tutoring preferred by them or their parents.

The Communists were the only party opposed to the adoption of the new constitution. Under the leadership of Luis Carlos Prestes, they became one of the most politically aggressive groups in Brazil. It was claimed that within a year the membership of the Communist party in Brazil had increased from 4,000 to 130,000. This growth alarmed some political leaders of other parties who had been endeavouring to form a coalition against the Communists. Anti-Communist sentiment grew throughout the country after their leader declared in an interview that in case of war against the U.S.S.R. he would form a resistance movement to prevent the entry of Brazil into such a war, which, in his opinion, could be nothing but imperialistic. As a consequence of this declaration, the constituent assembly considered proposals to declare the Communist party illegal on the grounds that its members swore allegiance to a foreign power. Steps were taken to oust all party members from positions of trust in the government. Food riots which occurred in Rio de Janeiro in early Sept. 1946 were attributed to the Communists.

International Stature.—Internationally, Brazil's prestige increased a great deal during the 1937–46 period. The nation took active part in the Eighth Pan-American Conference (Lima, Peru, 1938), the Conferences of Ministers of Foreign Affairs of the American Nations (Havana, Cuba, 1940, Rio de Janeiro, 1942 and Chapultepec, Mexico, 1945), and the United Nations conference of San Francisco, Calif. (1945). Brazil was the sixth country to ratify

the charter of the United Nations (Sept. 21, 1945) and was elected to fill one of the nonpermanent seats in the Security council. As one of the nations which signed the terms of surrender of the axis powers in Europe, Brazil participated in the Paris Peace conference of 1946.

Relations with the United States became increasingly more cordial because of Brazil's participation in the war effort, and because of U.S. sponsorship of certain Brazilian claims in the United Nations. A possible cause of friction between the two countries—the return of the air and naval bases constructed with the assistance of the United States along the Brazilian coast—was removed by the withdrawal of U.S. personnel as soon as circumstances and technical requirements permitted after the war.

There was considerable dissatisfaction in Brazil, however, over the ceiling prices imposed by the United States

9Combined total: 1,000 schools čEnrolment for all schools: 3,710,000 students. for coffee during the war period. An increase of three cents per pound on Nov. 17, 1945, did not prove satisfactory to the Brazilian producers, who claimed that wages and prices of materials had increased so as to wipe out their profits. In March 1946 the United States announced an extension of the subsidy to cover an additional 7,500,-000 bags through June 30, 1946. On May 7, 1946, a protocol for the extension of the Inter-American Coffee agreement was proclaimed by President Truman for one year (from Oct. 1, 1945). The protocol retained the framework of the Inter-American Coffee agreement but suspended the provisions relating to coffee quotas, with the exception that under emergency conditions, those provisions would again become effective upon a motion approved by at least 95% of the total vote of the Inter-American Coffee board. On Aug. 21, 1946, an agreement was signed between the United States and Brazil providing for the increase of the prices for green coffee (8.32 cents U.S. cur-

rency). This increase was in addition to the ceiling price established by the agreement of Dec. 27, 1941.

With reference to other American nations, Brazil maintained a friendly attitude. Brazil recognized Gen. Juan Perón's regime in Argentina, refusing to take any action against him which might be construed as antagonistic.

(R. p'E.)

The Brazilian Expeditionary Force.—In July 1944, the Brazilian Expeditionary force (F.E.B.) took up its position on the Italian battle front. It rapidly accustomed itself to the new and harsh topographic conditions and kept perfect discipline.

War Minister Dutra wished to verify at first hand the situation of his troops, and accordingly visited the front in October, passing through the lines and command posts. The British government invited Dutra to go to Great Britain and received him with special honours. Returning to Naples, he was "briefed" by Gen. Zenóbio da Costa on the situation of Brazilian troops; he then returned to Brazil.

In Nov. 1944 Brazilian troops were in the valley of Serecchio. Shortly thereafter, in nearly unbearable cold, they went into the Rhenish valley, in the heart of the Apennines, where they remained entrenched until Feb. 1945. Immediately afterward they fought at Cassino, and then performed the brilliant manoeuvre of Castelnuovo, applauded by Lt. Gen. Mark Clark, commander of the 5th army, and by Gen. Willis Crillemberger, commander of the 4th corps.

A series of clean-up operations followed in Monese, in the Panaro valley, in the region of Zecca and in the area of Vignola.

It was the task of the Brazilian army to prevent the junction of German troops fighting in the Apennines with those operating north of the Po. Brazilians encircled the 148th German infantry division, crossed the Po at Cremona and Placencia, and established a bridgehead to the west through Alexandria to Turin. The army operated, finally, at the foot of the Alps, and consummated its junction with French forces.

Bread and Bakery Products

The baking industry can be viewed as a food-processing industry in which it is the baker's function to utilize his special knowledge and skill to convert flour and other ingredients into appetizing, nutritious and economical baked foods. Because the principal ingredient of bakery products is flour, the baker fundamentally is a converter of wheat into human food. In all of its processed forms, of which bread is the most important item, wheat is a staple food in the diet of Europeans and people of European origin. Under ordinary conditions, breadstuffs supply from 25% to 40% of the total calories ingested by western peoples and one-third or more of the protein. Depending largely on the variety of wheat and the locality where it is grown, and even more on the degree of retention of its nutrients in processing, wheat contributes importantly to the dietary requirements for thiamin, niacin, phosphorus and iron, and furnishes a significant amount of riboflavin and other substances naturally found in wheat. In times of war or famine, bread is the most important single foodstuff, and efforts of governments are directed to the maximum production of wheat and to the greatest economy in its processing, distribution and utilization.

Technical Developments.—As in many other long established food industries, developments in the technology of baking during the decade 1937-46 were evolutionary in character. Methods earlier developed for measuring the physical characteristics of flour which are of importance in baking were extended so that it became possible to determine beforehand the proper amount of water to be added to flour in order to make a dough of suitable consistency for handling in large mechanically-equipped bakeries. The Brabender Farinograph came into more extensive use not only for this purpose but also for determining the proper length of time of mixing the constituents of a dough in order to obtain optimum development of the gluten. The amylograph, also devised by Brabender, became more extensively used in laboratories for characterizing cake flour. With the use of such instruments, as well as others, the baking industry was put on a more scientific basis; however, the art of baking still predominated over technology in the smaller handcraft shops.

Further studies were made of the enzymes of flour and their significance in baking; indeed, this field was the subject of a monograph published under the auspices of the American Society of Cereal Chemists. A monograph on the bromate effect was written in Danish and translated into English; with the recognition of the improvement in baking produced by minute traces of potassium bromate added to flour, it became possible to make use of many varieties of flour milled from European wheats which had inferior baking qualities and which tended previously to restrict their use primarily to the feeding of animals. A notable development in baking technology was refrigeration of dough at a temperature of about 35° F. and a relative humidity of 85%, under which conditions it can be kept for several days prior to use. As a result of the application of this process, much night work was eliminated and, because bread and rolls, etc., can be baked several times during the day in quantities to meet consumer demands, economies were effected and fresher products offered to consumers. The practices of slicing and wrapping bread became almost universal in the United States and to a limited extent were adopted in other countries. Waxed paper wrappers contributed to cleanliness, and their use improved the keeping quality of bread.

Statistics of the Industry.—In the United States, there had been for many years a transition from home baking to commercial baking, a trend which was accelerated during World War II. In 1938–39, the per capita consumption of flour was 154 lb., of which 74 lb. were processed by the baker and 69 lb. by home bakers; the remaining 11 lb. of flour were used for other foods. In the crop year 1943–44, the per capita consumption of flour had risen to 160 lb., of which 95 lb. were processed by the commercial baker and only 51 lb. by the home baker. In 1944–45, the per capital consumption was estimated at 161 lb., 97 lb. being processed by commercial bakers, 49 lb. by home bakers, and the remaining 15 lb. used for other foods.

Among the food industries of the United States, baking continued to hold first place in payroll size and number of employees and was second to the meat packing industry in the dollar value of its products. The value of bakery products in 1939, as estimated by a government census of manufacturers, showed a total production valued at about

\$1,200,000,000, but this estimate did not include the commercial production of biscuits, crackers and pretzels, which would bring the total value of the industry's production to about \$1,500,000,000. No census of manufacturers was taken during the war years, but estimates of sales volume indicated a tremendous increase. A writer for the American Baker in May 1945, estimated that in the calendar year 1944, the total value of bakery products was \$2,340,516,000. Of this total, \$1,349,563,000 represented the value of the production by large wholesale bakers, \$543,185,000 represented the estimated value of the products of small retail bakers, and \$447,768,000 represented the estimated value of the products of the biscuit and cracker bakers.

In Great Britain, there were nearly 27,000 bakeries in operation during the war years, as shown by reports of licences issued, a fact which emphasized that in Great Britain as in most other countries with the exception of the United States, commercial baking was conducted largely by small retail shops. However, the largest bakery in the world was reputed to be in London, and the second largest, in 1946, in Buenos Aires. According to figures of the Office of Price Administration, there were approximately 30,000 commercial baking establishments in the United States during the war years, but many of these were small shops, and it was estimated that 90% of the production was baked by less than 8,000 bakeries.

Wartime Regulations.—In every country, governments regulated the baking industry during World War II, with the aim of avoiding waste, effecting economies in the use of food, and increasing the nutritive quality of bread as a factor in maintaining the health of the people.

Great Britain.—In the United Kingdom, all bakeries were licensed during the war, and the products were subject to price control. Because of the shortage of fats and oils, no more than two pounds of fat was permitted to be used with each sack (280 lb.) of flour. Flour was required to be of longer extraction, and as a consequence white bread of a darker colour was produced. To some extent, a mixture of other grains was required, and at times the inclusion of potatoes in bakery products was made mandatory. The British baker developed considerable ingenuity in incorporating mashed boiled potatoes in bakery products, especially in cakes, but the preparation of the potatoes required much labour.

United States.-Regulations developed under the War Powers act required bakers to effect economies in production, such as the elimination of double wrappers, and the prohibition of the practice of taking back unsold bread from grocery stores. The amount of shortening and sugar used in bread production was restricted. Dried skim milk, which contributes importantly to the nutritive quality of bread and other bakery products, became scarce because of the use of this important food in relief feeding, and for use by the military forces. Not until the end of the war was it found necessary in the United States to conserve flour. During 1946, because of the demand for wheat in feeding people in other parts of the world, bakers were restricted in the use of flour, and the flour itself was required to be of longer extraction. Whereas, under ordinary conditions, flour represented about 72% of the weight of the grain from which it was milled (the remaining 28% being used for animal feeds and other products) a government order required the miller to supply flour of not less than 80% extraction. This order was rescinded in October 1946, as a result of the record-breaking wheat crop of 1946 and because experience showed clearly that the measure itself did not result in a great saving of wheat.

Germany.—A report of a British committee which visited Germany in 1946 dispelled the rumour that the Germans had incorporated sawdust in bread during the war. They found that sawdust had been used as a dusting flour in the production of rye bread; buckwheat bran was similarly used as a dusting flour in the production of white bread. Most of the bread in Germany was made from rye flour of high extraction, and it was customary to mix with it barley and potato flour. Consideration was given to vitamin fortification of the bread to improve its nutritive value, but apparently the idea was abandoned because of the lack of vitamin supplies.

Nutritional Improvement.—The most significant accomplishment of the baking industry during the decade doubtless was the bread enrichment program. This program was launched in 1940, when the need for better national nutrition was made evident by dietary surveys which showed that the U.S. prewar diet did not supply enough thiamin, riboflavin, niacin and iron. These nutrients are found in whole wheat bread, but consumer preference is for white bread, which is consumed daily in substantial quantities by all segments of the population. The addition to white flour and white bread of thiamin, riboflavin, niacin and iron in amounts related to the human needs for these nutrients improved the national dietary and accomplished this improvement at low cost and without changing food habits. The comparative composition of a pound of plain white bread, enriched bread and whole wheat bread was reported by the Bureau of Human Nutrition and Home Economics as follows:

								Plain mg./lb.	Enriched mg./lb.	Whole Wheat mg./lb.
B ₁								0.3	1.1-1.8	1.3
B ₂									0 <i>.7-</i> 1.6	0.7
Niacin								3	10-15	16
lron .									8-12 .5	11.8
Calcium									254	272
Protein		_			_			39 arams	39 arams	43 arams

Enrichment was widely adopted in Sweden, where it was estimated 85% of the flour was being enriched, and in Newfoundland, where all flour was required to be enriched. In most other countries, undermilled flour and darker breads were adopted as a wartime measure, resulting in improved nutritive values of the national dietary over what would have been obtained from bread made with white flour. The baking industry of the United States declared its intention to continue the enrichment of bread and rolls with the B-vitamins and iron as a permanent measure. By the end of 1946, there were 19 states which had enacted laws requiring the enrichment of all white bread and rolls. The territories of Hawaii and Puerto Rico had enacted similar legislation. (See also Flour.)

Breadner, Lloyd Samuel

Breadner (1894-), Canadian air force officer, was

born July 14, 1894, at Carlton Place, Ont. Educated at Ottawa, he served in the royal air service, first as a flight sub-lieutenant in the royal naval air service in 1915, later transferring to the royal air force. By Nov. 1918, he had attained the rank of major. He was associated with the royal Canadian air force as of 1920, becoming certificate examiner for the air board. Two years later, he became director of civilian aviation, but in 1928 returned to military aviation, serving as acting director of the R.C.A.F. (1928–32).

In 1940, following the outbreak of World War II, he was appointed air vice-marshal and chief of the air staff. Named air marshal in 1941, he was again promoted, Nov. 11, 1943, to the rank of air officer commanding the R.C.A.F. overseas. Air Marshal Breadner was created a companion of the Order of the Bath in the King's Honours List of 1943. On March 17, 1945, he retired and a few days later was given the rank of air chief marshal.

Brereton, Lewis Hyde

Brereton (1890—), U.S. army officer, was born June 21, 1890, in Pittsburgh, Pa. A graduate of the U.S. naval academy at Annapolis (1911), he was commissioned an ensign, but later resigned to become a lieutenant in the army's coast artillery corps. He took flight training in 1912 and commanded one of the first U.S. flying units on the western front during World War I. An early exponent of dive-bombing, Brereton was commander (1922) of the first aviation attack group in the army air corps. He held several important air commands in the years preceding World War II, and in Nov. 1941, he took command of the army air force in the Philippines.

After the loss of the Philippines, he was made chief of the U.S. air forces in India. Transferred to the middle east, in June 1942, as U.S. air commander, he became U.S. commander in chief of the U.S. army air forces in the middle east in Feb. 1943. On Aug. 10, 1944, the Allies revealed that a new airborne army had been established with Brereton as commander in chief. His force launched an air-borne invasion of the Netherlands, Sept. 17, 1944, in a daring but vain attempt to cross the Rhine river at Arnhem. On March 24, 1945, some three divisions of his 1st Allied airborne army landed behind German lines on the east bank of the Rhine. This operation, smoothly coordinated with other Allied crossings, was successful.

After the end of the war in Europe, Gen. Brereton was a member of Gen. Courtney Hodges' U.S. 1st army staff. In March 1946, Gen. Brereton was appointed to the Joint Chiefs of Staff Evaluation board that reported on the two atomic bomb tests at Bikini Island. Brereton's work, *The Brereton Diaries*, recounting the air war in the Pacific, middle east and Europe, was published in the fall of 1946.

Brett, George Howard

Brett (1886—), U.S. army officer, was born Feb. 7, 1886, in Cleveland, O. He was graduated from Virginia Military institute, 1909, and attained the rank of major during World War I. He retired from active service in 1920, but later returned to the army, specializing in military aviation and winning a rating as an army command pilot. In Oct. 1940 he was promoted to the rank of major general. Prior to the entry of the U.S. into World War II, Gen. Brett toured the middle east and Britain for the purpose of co-ordinating British and U.S. aircraft production. After the Pearl Harbor attack plunged the United States into the conflict, Gen. Brett, British Gen. Archibald Wavell and Generalissimo Chiang Kai-shek set up a military council in Chungking the purpose of which was joint and

common prosecution of the war against Japan. On Jan. 3, 1942, Gen. Brett was appointed deputy supreme commander to Gen. Wavell for the far east. On Jan. 10, 1942, he was promoted to the rank of lieutenant general. The following March he was appointed commander in chief of Allied air forces in the Southwest Pacific. On Nov. 4 (1942) Gen. Brett succeeded Gen. Frank M. Andrews serving as head of the Caribbean defense command until he retired from active duty in 1945.

Brewing and Beer

Prior to the prohibition act of Jan. 16, 1920, the brewing industry in the United States comprised 1,392 individual breweries with a total capitalization of \$792,-914,000. It employed directly 75,404 persons. After 13 years of prohibition, the production and sale of beer was relegalized by act of congress on April 7, 1933. By 1937 the industry had again become stabilized as an important economic factor, with annual sales reaching the 50,000,000 bbl. mark. The ten years following 1937, witnessed the inauguration and implementation of many new programs by the industry.

Self-Regulation.—On June 5, 1938, the brewing industry launched a program of self-regulation, using Nebraska as the testing ground. The industry set up a state organization directed by a nonindustry executive, to develop a program of co-operation with state and local enforcement authorities. Retail outlets within the state were checked by industry investigators and, if violations were found, proper warnings were served upon the proprietors. Failure to correct conditions complained of, within a reasonable time, resulted in submission of evidence to licensing authorities by industry representatives, usually leading to suspension or revocation of licences. The shutting off of beer was another punitive measure employed by the brewers' self-regulation committee against offending retailers who failed to heed warnings. The most progressive results, however, were obtained through educational efforts.

Following the success of the Nebraska experiment, the industry's self-regulation program was extended to other states until in 1946 there were 16 states operating under the program sponsored by the United States Brewers foundation. This program was unique as a practical demonstration of industry self-regulation, and was made the subject of many commendatory articles in national magazines and the press. It won the backing of the vast majority of retail beer dealers, who found the program was in their best interests. Proof of the efficacy of the program was the wide acknowledgment by public officials of its aid in enforcement of laws governing the sale of beer.

Army and Navy Co-operation.—Even before the U.S. Selective Service act was passed, the leaders of the industry realized that self-regulation might be complicated by the mushroom growth of many communities in the vicinity of army training camps. It seemed likely that enterprises set up to attract the service men would also include retail beer establishments. To ensure that retail beer establishments would measure up to high standards and provide wholesome environment for service men, a portion of the brewing industry comprising the United States Brewers

foundation organized its army and navy co-operation program. It was administered and staffed by men who acted in liaison with army and navy authorities to promote moderation and sobriety among the services, and to provide wholesome conditions in places where beer was sold at retail in areas near service posts.

The co-operative efforts of the brewers, aided by the retailers and wholesalers, won commendation of the war and navy departments. They officially directed commanding officers of posts and stations to make use of the foundation's assistance wherever conditions warranted.

In a letter to the foundation, written Dec. 14, 1945, Secretary of War Robert P. Patterson said: "It is gratifying to know that the relations between the staff of the Foundation's Army and Navy Co-operation Program and the various military and civil law enforcement authorities have been of such benefit to members of the armed forces through the maintenance of high standards among retail beer outlets." A similar commendation was received from the navy department, signed by Rear Adm. William M. Fechteler, assistant chief of naval personnel.

On Dec. 30, 1942, the Office of War Information issued a report on a coast-to-coast survey made by OWI of drinking conditions in and around army camps. The report said, "No American army in all history has been so orderly," and in several instances cited the benefits of the availability of beer in and near army camps.

Secretary of War Henry L. Stimson previously had stated the war department's attitude on the policy of making beer available on military reservations. In a letter to Senator Robert R. Reynolds, then acting chairman of the senate committee on military affairs, May 2, 1941, Secretary Stimson said: "This policy has caused a degree of temperance among army personnel which is not approachable in civil communities now, nor was as high a degree of temperance attained either in or out of the army during the days of national prohibition. Under this policy, military personnel are encouraged to remain on the reservation and enjoy refreshments under conditions conducive of temperance."

The War Years.-Wartime restrictions curbed the amount of barley malt the brewers were permitted to use. Beginning on March 1, 1943, brewers were limited to 93% of the quantity they used in the corresponding periods of the base year (March 1, 1942, to Feb. 28, 1943). Exemption, however, was made for brewers using 70,000 bu. or less annually. Beginning March 1, 1945, brewers using over 70,000 bu. were cut to 81.8% of the amount of malt they used in each quarter of the 1942 base year. After Dec. 1, 1945, brewers were permitted to use 20% more malt than they had used during the previous quota periods. This order remained in effect until the more drastic order, limiting brewers to 70% of their 1945 usage of grain, was ordered by the president, effective March 1, 1946. On Sept. 1, 1946, the latter restriction was modified, permitting brewers to use 85% of the quantity of grains used in the corresponding quarter of 1945. On Oct. 21, 1946, the order was further modified to 90%, retroactive to Sept.

Because of favourable conditions in the grain supply situation, the government made a further liberalization of restrictions on brewers' use of grains on Dec. 1, 1946. The amended order authorized brewers to use, in the three-month quota period beginning on that date, an amount of grain equal to 100% of their use in the corresponding quota period of the previous year. Wheat and

table rice remained prohibited.

As a result of the reductions in ingredients, the brewing industry was unable to produce enough beer to meet demand during much of the war and early postwar period. The amount available for civilians was further reduced by government orders setting aside specific percentages of malt for beer production for the armed forces. Military authorities had recognized the morale value of beer, and in order to guarantee an adequate supply of the beverage for the armed forces, the government directed brewers to set aside 15% of their use of malt for the brewing of 3.2% beer for military personnel. This setaside order was reduced to 5% on Dec. 1, 1945, to 4% on June 13, 1946 and 3% on Sept. 1, 1946, in line with the return of a large number of the military to civilian life and correspondingly reduced requirements for the armed forces. Most of the beer exported to the armed forces was contained in one-trip bottles and cans, which were available only for the armed forces. Cans and one-trip bottles for beer had become civilian casualties early in the war.

Throughout the war, equitable distribution of beer on the home front became a problem. Many brewers established a quota system, based on dealers' sales of the previous year, consideration being given to areas with a concentration of war workers. This could not solve the shortage, but it did ensure distribution of beer on an equitable basis

In common with other industries, the brewers laboured under shortages and other wartime curbs. Manufacturers of brewing equipment had converted to war production, obliging the brewers to get along without replacements. Construction work had to be postponed "for the duration" and until materials became available again. Clydesdales and percherons, once a common sight before motorized delivery, emerged from retirement to help relieve local transportation problems. Many brewers voluntarily reduced their shipping radius* to co-operate with the Office of Defense Transportation and to help relieve freight congestion.

Brewing and the Grain Supply.—The year 1946 opened with bright prospects for the brewing industry, with the lifting of many restrictions, including the curb on the use of malt. On March 1, 1946, however, the government directive referred to above cut use of malt and other grains by 30% of the amount used by brewers in 1945. The order further prohibited altogether the use of wheat in the production of malt beverages. A very small amount of wheat—less than .0008 of the U.S. 1945 crop—had been used by the brewers in 1945 to offset, in part, the reduction in their allotment of malt, but wheat had rarely been used as a brewing ingredient under normal conditions.

Immediately following receipt of the presidential order, directors of the U.S. Brewers foundation adopted a resolution urging all brewers of the nation to cut production of beer and ale in proportion to the reduction in their grain supply so that quality would be maintained.

Some economists pointed out that while the intent of the conservation order was laudable and would enable more grain to be sent to needy populations abroad, the economic loss to the nation was considerable. This included the loss of federal taxes (\$8 per barrel), state taxes, in brewery wages, loss to allied industries and cost of the grain to the government.

Unlike other food industries which draw upon the farms for their source of ingredients, the brewing industry extracts only a portion of the total nutrients contained in the raw materials. It returns the remaining con-

stituents—estimated at 35% of the original total—to the farmer in the form of feedstuffs containing most of the proteins in the original grain. In addition, it supplies the farmer with by-products of measurable value.

In the first category are residual grains, which consist of wet and dried brewers' grains recovered from the brewing process. These are of high value both for livestock and poultry feeding. They are considered an excellent protein supplement for dairy cattle when used as part of the ration.

Brewers' yeast, a by-product of the brewing process, was supplied in increasing quantity in the latter half of the decade 1937–46, both as a human nutrient supplement and as a protein and vitamin supplementary feed for livestock and poultry to provide a balanced ration. It is the richest known natural source of vitamins of the B complex and contains between 40% and 50% of high-grade protein. Its nutritional value in enriching the diet of the men in the armed forces and in civilian war production was recognized, and the American brewing industry, at the request of the U.S. War Food administration, organized its facilities to increase the production of yeast. Production was increased to approximately 25,000,000 lb. annually.

Technical Developments.—Chief among the technical and technological developments during the decade were the following: introduction of a new type of lauter tub to permit faster lautering (draining off) of the wort; increased efficiency in bottling operations through new high-speed bottle fillers and spray type of pasteurizers; introduction of such materials as sorghum grains and other supplementary adjuncts in brewing to offset the shortage in corn and rice; more extensive use of glass-enameled, stainless steel and aluminum tanks in cellar operations; introduction of ultraviolet radiation in brewery cellars and cooler rooms as an aid to air purification; increasing practice of wort and beer filtration through diatomaceous earth.

Sales Records.—The year 1937 marked the first time since the relegalization of beer that sales topped 50,000,000 barrels. The demand continued to increase until in 1945, sales topped 80,000,000 barrels, breaking all previous records. During this period the number of breweries decreased from 750 in 1935 to 463 in 1945.

The decline in the number of breweries was explained in various ways. Relegalization of beer, in 1933, had attracted to a highly specialized industry many inexperienced men who saw an opportunity for quick profits on their investments or promotions. Under-financing and inefficiency proved fatal to a number of enterprises. Real stabilization in the industry was not reached until the number of plants fell below 500.

Some of the reasons for the high sales were the record national income, increase in population, heavy pay rolls and the large number employed in war production and heavy industry, and the increased acceptance of beer as a beverage of moderation. Studies revealed that persons engaged in work requiring physical energy consumed more beer than the average, because of their need for relaxation, refreshment and restoration after a hard day's work.

The industry's sales statistics were based on U.S. internal revenue reports of taxpaid withdrawals for the fiscal years ending June 30. As cited here, the reports cover the tenyear period for the fiscal years 1937 to 1946. Following are the sales in U.S. barrels (31 gal.) for those years: 1937, 55,391,960; 1938, 53,926,018; 1939, 51,816,874; 1940, 53,014-230; 1941, 52,799,181; 1942, 60,856,219; 1943, 68,636,434; 1944, 76,969,764; 1945, 79,590,598; 1946 (official but not audited), 80,735,720.

Package sales, considered significant of the extent of the

home use of beer, maintained progressive gains throughout the ten years, reaching a new high in the calendar year 1945 when 64.4% of all taxpaid withdrawals represented sales in bottles. They did not include sales in cans and one-trip bottles to the armed forces overseas. These, being exported exclusively for the armed forces, were not federally taxed. In 1934, 75% of the brewing industry's output was sold in barrels. Government reports made no breakdown of beer sales in the years prior to prohibition, but draught (keg) beer was dominant then.

Numerous factors probably were responsible for the trend toward package beer, and it would be impossible to determine the relative importance of each. It is likely that the following were most important:

- 1. Increased consumption of beer in the home. Consumer surveys showed that approximately half of the families in urban communities bought beer for home consumption. Most of these purchases were made in grocery stores;
- 2. More convenient and attractive packaging. After 1935 a wider choice of containers, including new styles of cans and bottles, was made available to the public. These containers were backed by the competitive advertising efforts of the glass bottle and can makers, and the brewers themselves advertised package beer extensively;
- 3. Advent of mechanical refrigeration in the home; this made it possible for housewives to store package beer as a home staple. Roomier space for provisions than was possible in the old-fashioned icebox, and constant cooling temperature, also helped;
- 4. Limitation of off-premise sales to package beer in some areas;
- 5. Lower licence fees for off-premise sales, attracting many grocers to the field of beer retailers.

Taxes.—All beer, before packaging for sale, is run through meters, at the brewery, which give the government an absolute check on the amount of federal taxes due. Both the beer in the bottling house and in the draught department is thus metered which enables government authorities to get an accurate breakdown on the amount of package and keg sales. These meters were not in use in the preprohibition years, which probably accounts for the absence of statistics on draught and package production for that period.

The federal excise tax on beer and ale was \$5 per barrel until June 30, 1940. Then it was raised to \$6 per barrel, which was the rate until Nov. 1, 1942, when it was increased to \$7 per barrel. On April 1, 1944, another dollar was added to the tax rate as a wartime emergency measure. This made the tax rate \$8 per barrel, as contrasted with the rate of \$1 per barrel from 1902 to 1914. In addition, there were state taxes, varying in different states, and in some areas local taxes. There were no state taxes in the pre-prohibition years.

Taxes collected from beer by the United States government from April 7, 1933, to June 30, 1946, totalled \$4,773,609,186. State and local taxes for the same period totalled about \$1,675,000,000, making the combined revenue approximately \$6,448,609,186 since relegalization.

Taxes collected by the federal government continued to go into the general fund of the U.S. treasury. Beer taxes collected by the states were earmarked for specific purposes in some instances. In Georgia, for example, the \$3,343,445 collected in state beer excise taxes and licence fees for 1945 was used for the purchase of free textbooks in the public schools of the state, for the payment of teachers' salaries and for other school purposes. Many other states

also allocated a high percentage of revenue received from beer for educational, public welfare or public improvement purposes. (C. D. Ws.)

Great Britain and Europe.—Sharp breaks with established brewing practice might well have upset the traditional character of beer, but continued progress caused a gradual evolution in operational details, almost imperceptible in individual stages, but significant when viewed against a wider background. Plant developments, aimed at enhancing cleanliness and economy of working, included the increasing use of glass-lined tanks for beer storage and the investigation of a variety of alloys and plastic linings for fermenting vessels and other containers. Steam heating for hop boiling, as opposed to traditional fire heating, was still a matter for controversy, at least in top-fermentation breweries.

The full significance of brewing researches could be appreciated only in relation to studies in other fields, such as those on starch structure, the characters of the starch-splitting enzymes, the intricate biochemical changes in fermentation and the role of certain vitamins therein. Apart from studies on the behaviour of hop resins in the brewing process, hop investigations were mainly devoted to studying new varieties-with some success in Britain-and to controlling virus and fungus hop diseases. Renewed interest in barley followed the increasing use of the combine harvester, which necessitated wide departure from conventional treatments subsequent to cutting, with possibly a consequent deterioration of the malting quality of the grain; the dangers were well recognized, and plans for satisfactory solution were studied. Very striking was the study made in the Carlsberg laboratories of yeast reproduction, showing that spore formation is necessarily preceded by a sexual fusion, the later separation of individual spores involving a reduction division similar to that which precedes the formation of pollen grains in higher plants. Hybridization of yeasts was then possible. The concept of pure culture yeast thus demanded new definition, and the work gave promise of significance in those breweries where pure culture working was the rule. Work on the nitrogenous nutrition of yeast was of more general interest; a complete solution of this problem would permit more rigid control of yeast behaviour in brewery fermentations.

Biological stability of beer received much attention in Britain, while nonbiological stability was principally investigated by continental workers. The significant role of oxidative changes in many classes of beer deterioration was established, and the direct influence thereon of physicochemical properties of proteins again illustrated the value of initially academic researches in aiding the solution of practical problems. The immediately appealing properties of foaminess and flavour were not overlooked, and several workers developed interesting methods for at least assessing these characters in beers.

War conditions limited, and in some cases profoundly modified, the types and proportions of raw materials available, with further difficulties from limited manpower and distributional facilities and from increased taxation. Results in some countries were the reduction or even complete cessation of production, and in others a production maintained with difficulty of beers of reduced gravity, using, for example, unfamiliar blends of malt and reduced supplies of sugar. The influence of war conditions would pass with time, but events of 1939–46 appeared to emphasize the impossibility of having too great a knowledge of raw material properties and of the biochemistry of their

Bricker, John William

Bricker (1893—), U.S. politician, was born Sept. 6, 1893, in Pleasant township, Madison county, Ohio. He was graduated from Ohio State university in 1916, and received his law degree from that institution in 1920. During World War I, he served as a first lieutenant in the army. After the war, he entered public service as solicitor for Grandview Heights, O., 1920–28, and was assistant attorney general of Ohio, 1923–27. He was a member of the public utilities commission, 1929–32 and served as attorney general for Ohio, 1933–37. Elected governor of Ohio on the Republican ticket for the 1939–41 term, he was twice re-elected to that office.

An outspoken foe of the New Deal, Bricker was selected as candidate for vice-president by the Republican national convention in 1944. He went down to defeat with his running mate, Gov. Thomas Dewey of New York, in the 1944 elections. Two years later, Bricker ran for senator of Ohio, scoring an impressive victory in the elections of Nov. 5, 1946. His name was mentioned prominently as presidential timber for 1948, and many Republican officials favoured Bricker over Dewey because of the former's greater acceptability to midwest Republicans. In domestic politics, Bricker described himself in his 1946 election campaigning as a "middle-of-the-roader." He said that he favoured minimum wage legislation, a permanent Fair Employment Practices commission and a federal anti-poll tax law. He opposed the Wagner-Taft-Ellender housing bill and urged elimination of all wartime controls, as well as the reduction of 1,000,000 employees from the federal pay roll. On foreign policy, he was of the opinion that the United States should neither divulge its atomic bomb "secrets" nor "appease" the "dictator powers."

Bridge, Contract

See CONTRACT BRIDGE.

Bridges, Harry

Bridges (1900—), U.S. labour leader, was born July 28, 1900, in Melbourne, Australia. The son of a prosperous real estate dealer, he left school and shipped to sea in 1920. After voyaging about the world as a merchant seaman, he settled in San Francisco in 1924 as a long-shoreman. An ardent trade unionist, he organized the majority of the city's longshoremen into a union by 1933. He led the successful docker's strike of 1934 and the following year formed the Maritime Federation of the Pacific, an association of several marine and waterfront unions. In June 1938, the longshoremen and affiliated unions joined the C.I.O., and Bridges was made regional director of the C.I.O. on the west coast.

His tremendous influence on the west coast aroused the antagonism of business groups, who launched a campaign (that soon became nationwide) denouncing the Australian-born labour leader as a communist and demanding his deportation. Bridges asked the department of justice for a ruling as to his status in Feb. 1938. Frances Perkins, then

secretary of labour, issued a warrant for his deportation on grounds that he was a communist, but in Jan. 1940, James M. Landis, special examiner in the case, ruled that while Bridges' aims were "energetically radical" there was no evidence that he sought to realize those aims by unconstitutional or undemocratic methods. A bill was then introduced in the house of representatives designed to deport Bridges to Australia, but the senate immigration committee blocked the measure in Aug. 1940.

Subsequently, a new examiner, Judge Charles Sears of New York, recommended Bridges' deportation. He was overruled by the board of immigration appeals, but in 1942, the board in turn was overruled by Attorney General Biddle. On June 18, 1945, the supreme court revoked the order. On Aug. 8, 1945, Bridges passed a preliminary U.S. citizenship test and on Sept. 17, 1945, became a U.S. citizen.

Bridges

Completion of the world's longest span, the Golden Gate bridge, in 1937 marked the first year of an eventful decade in the history of bridge engineering. In the period 1937 to 1946, new and unprecedented records of span length were established in five bridge types: suspension, continuous truss, continuous girder, reinforced concrete arch and reinforced concrete girder. A new bridge type, the Wichert truss, was introduced and developed. Notable spans of other types were built, including cantilever, steel arch, vertical lift, bascule and timber spans. (For other bridge types, including simple trusses, swing spans, masonry arches and plain concrete arches, no notable new spans were recorded, indicating that these bridge types had become largely outstripped or superseded.) Large pontoon bridges, both of concrete and of steel, involving novel design features, were built in several different parts of the world. All this record of new achievement was recorded despite the interruption of construction during World War II. As a matter of fact, the war stimulated the development of new and effective types of military bridges and established new records for speed in military bridge construction.

Perhaps the most eventful features in the bridge history of the decade were the spectacular failures of two notable bridges, the Tacoma Narrows bridge in 1940 and the Chester bridge (over the Mississippi river) in 1944, the one dramatically awakening the profession to the aerodynamic effect of wind and the other illustrating the aerostatic effect of the wind. Intensive research, both experimental and analytical, was initiated by these bridge catastrophes. Far greater destruction was caused during the decade by the military operations of World War II; thousands of bridges in Europe and Asia, including many historic and world-famous spans, were damaged or demolished.

Suspension Bridges.—In 1937 a new record for the world's longest span of any type was achieved with the completion of the Golden Gate bridge at San Francisco—a suspension bridge of 4,200 ft. span, with towers 746 ft. high and with two parallel wire cables 36½ in. in diameter. It was the final achievement of a lifelong ambition of Joseph B. Strauss, chief engineer of the project, who died 11 months later. The prior record was held by the George Washington bridge over the Hudson at New York city, completed in 1931, with a span of 3,500 ft. and with four cables 36 in. in diameter.

On July 1, 1940, the Tacoma Narrows bridge at Puget sound was completed and opened to traffic. Built at a cost of \$6,400,000, with a main span of 2,800 ft., it was the

third longest span in the world. Four months later, on Nov. 7, 1940, the undulations of the bridge in a 42-mi. gale changed to twisting oscillations and increased to destructive amplitude (a double amplitude of 28 ft.) until the main span broke up, ripping loose from the cables and crashing into the waters of Puget sound. At first the failure was erroneously attributed to the narrow width of the bridge, only 1/75 of the span, and this popular fallacy persisted despite its scientific disproof. The true cause of the catastrophe was the extreme vertical and torsional flexibility of the span, yielding energy absorption entirely inadequate to counteract the inherent aerodynamic instability of the cross section. With the stiffening girders only 8 ft. deep, or only 1/350 of the span, the Tacoma bridge was by far the most flexible of all modern suspension bridges. The span was safely designed for all of the specified loads and forces, including the static effect of a wind pressure of 50 lb. per sq.ft. But it was destroyed by the dynamic effect of a wind pressure of only 5 lb. per sq.ft. The phenomenon is one of self-excited amplification of oscillations, drawing energy from a steady wind, until the oscillations (vertical or torsional) reach limiting or destructive amplitudes. Intensive investigations, including both mathematical analysis and model tests, were initiated by the Tacoma disaster, to guarantee the aerodynamic stability of future bridges.

In 1944 a number of vertical vibration recorders were installed on the Golden Gate bridge to measure and study the amplitudes and modes of the aerodynamic oscillations of the 4,200-ft. span. Vertical oscillations with amplitudes of more than five feet were measured on the 3,500-ft. span of the George Washington bridge.

The Bronx-Whitestone bridge spanning Long Island sound and connecting the boroughs of Bronx and Queens in New York city, with a main span of 2,300-ft.—fifth longest on record—was opened in May 1939. It was built in 23 months (the cables being constructed in the record time of two months), in time for the opening of the New York world's fair. Initial installations of centre stays, diagonal stays and friction brakes proved inadequate to eliminate disturbing aerodynamic oscillations. Additional stiffening was authorized in 1942, but wartime priorities caused postponement of this work. In 1945 a contract of more than \$1,300,000 was let for strengthening the bridge by adding stiffening trusses 14 ft. deep on top of the 11-ft. stiffening girders, together with other measures for curbing the aerodynamic oscillations.

The largest suspension bridge in the British empire, the Lions Gate bridge over the first Narrows of the harbour at Vancouver, B.C., with a main span of 1,550 ft., was completed in 1938. The postwar plans of British engineers, announced in 1945, included two new long

span suspension bridges, one over the Severn and one over the Firth of Forth, the former to have a main span of 3,200 ft., with towers 500 ft. high, representing an entry into a new order of span magnitude for British bridge building.

Despite the war, or as a military necessity, a new highway suspension bridge over the Rhine, the Cologne-Rodenkirchen bridge, was completed in 1941. Its main span of 1,246 ft. was the longest on the European continent and the longest self-anchored suspension span in the world, until the bridge was demolished by the Germans in 1945. The two companion suspension bridges over the Rhine (Cologne-Deutz, 1915, 605 ft.; Cologne-Muhlheim, 1929, 1,033 ft.) were respectively the second and fourth longest self-anchored suspension spans in the world.

The Deer Isle bridge on the coast of Maine, completed in 1939, is a suspension bridge of 1,080 ft. span, using prestressed rope-strand cables. Centre stays and diagonal stays were included to stiffen the span against aerodynamic effects. The bridge had to be built with limited funds. A difficult deepwater problem was solved by lowering completely assembled sheet-pile cofferdams prefabricated to fit the rock contours.

The Beit bridge over the Zambezi river at Churundu, Southern Rhodesia, a suspension bridge of 1,050 ft. span—longest span bridge in Africa—was also completed in 1939.

The Peace river bridge on the new Alaska highway, built in 1943 by the U.S. bureau of public roads, is a suspension bridge of 930 ft. main span. The concreting for the main piers had to be executed at temperatures 40° below zero. For the military emergency, the structure

Destruction of the Tacoma Narrows bridge, third longest single suspension bridge in the world, was caused by a windstorm Nov. 7, 1940, four months after the bridge was completed. There was no loss of life

was completed in a total construction time of eight months, amid ice and snow, wind and floods.

The Puente Cuscatlan over the Lempa river in El Salvador, completed in 1942 with a main span of 820 ft., became the longest suspension span in Central America and a vital link in the Pan-American highway. Each cable was made of 16 galvanized bridge strands of 1-15/16 in. diameter.

An important international crossing is the Thousand Islands bridge, joining the United States and Canada across the St. Lawrence river. This crossing, $8\frac{1}{2}$ mi. long, utilizes the islands as steppingstones to reduce the span lengths required, so that the total cost was only \$2,800,000. The U.S. crossing consists of a suspension bridge of 800-ft. main span. The Canadian crossing includes a 750-ft. suspension span, a continuous truss of two 300-ft. spans and a steel arch of 348-ft. span. The dedication of the bridge in 1938 by President Roosevelt and Prime Minister Mackenzie King featured the celebration of 100 years of peace and good will between the two nations.

In Vienna, the Reichsbruecke, an eyebar chain bridge of 792 ft. span over the Danube, was completed in 1937, but was destroyed during the war.

The suspension type became widely adopted for low-cost highway bridges in Norway. The largest of these, the Hardanger bridge with a main span of 755 ft., was completed in 1938.

The Sullivan-Hutsonville bridge over the Wabash river, between Indiana and Illinois, built in 1939, brought the number of self-anchored suspension bridges in the United

States to five. The main span is 350 ft., and each cable consists of nine 1½-in. galvanized rope-strands in open formation.

An aerial transporter bridge of suspension type, with a span of 885 ft., was constructed in 1944 over the Espiritu Santo river (one of the tributaries of the upper Amazon) in Bolivia. The wartime need for natural rubber made this crossing vital. The suspended transporter car carries a six-ton truck across the span in 1½ min., yet requires only a 20-h.p. motor. The complete bridge was fabricated in the United States and carried by mule and canoe far into the Bolivian jungle, where it was erected in eight weeks by unskilled native labour under the direction of U.S. engineers.

The construction of the Tor der Welt over the Elbe at Hamburg, an ambitious bridge project involving 500,000 tons of steel and including a 2,296-ft. suspension span and an 854-ft. plate girder span, was suspended at the outbreak of the war in 1939.

The historic Menai suspension bridge in Wales, 580 ft. span, built by Telford in 1826, was reconstructed in 1939 at a cost of £200,000. A wider roadway for modern traffic was provided with the replacement of the four old wrought-iron chains by two chains of high-tensile steel eyebars.

Cantilever Bridges.—The Howrah bridge spanning the Hooghly river at Calcutta, begun in 1938 and opened to traffic in 1943, has a 1,500-ft. main span. It thus became the third longest span cantilever bridge in the world (exceeded only by the 1,800-ft. Quebec span and the two 1,700-ft. spans of the Forth bridge). The bridge carries a 71-ft. roadway and two 15-ft. sidewalks. The river span was erected without falsework, using two travelling cranes moving on the upper chords and building out the struc-

U.S. army's Bailey bridge under construction over the Volturno river in Italy in 1944. The bridge, made of portable, prefabricated parts, was assembled on one shore and pushed across to the other. A sturdy bridge with two tiers of girders could be assembled in 24

ture before them to junction at midspan.

Table II - Notable Cantilever Bridges Completed during 1937-46

The Story bridge at Kangaroo point over the Brisbane river, Queensland, built 1935-40, with a cantilever span of 924 ft., is a government-owned toll bridge and the second longest span in Australia (exceeded only by the Sydney harbour bridge, a 1,650-ft. arch).

Three new cantilever bridges over the Mississippi river were completed in 1940: at Natchez, Miss., a highway bridge with two 875-ft. spans; at Baton Rouge, La., a railroad and highway bridge with two 848-ft. spans; and at Greenville, Miss., a highway bridge with 840-ft. main span. Other cantilever toll bridges completed in 1940 included one over the Ohio river at Owensboro, Ky., with a main span of 750 ft., and one at Jamestown, R.I., with a 640-ft. span.

The Bluewater bridge, an international highway bridge connecting Port Huron, Mich., and Sarnia, Ont, across the St. Clair river, is an arched cantilever of 871 ft. span, completed in 1938. Other highway cantilever bridges completed in 1938 included the Cairo (Ill.) bridge over the Ohio river, a multiple cantilever with 800-ft. principal

Peace river bridge on the Alaska highway in British Columbia, completed in 1943

span, and the Port Arthur-Orange bridge over the Neches river, Tex., with 680-ft. span.

A new interstate highway crossing over the Potomac river at Ludlow Ferry, Md., two miles long and including an 800-ft. cantilever span and 22 approach spans (trusses and girders) of the Wichert type, was completed in 1940. An unusual cantilever bridge was completed in 1941 to carry the Great Northern railway across the Columbia river at Kettle Falls, Wash. The relocation of the railroad crossing was made necessary by the construction of the Grand Coulee dam. The 608-ft. centre span was made the anchor, with each end span consisting of a cantilever arm and a suspended span.

The Pit river bridge in California, with a cantilever span of 630 ft. and the world's highest bridge piersconcrete piers up to 360 ft. tall-was completed in 1941. Carrying a railroad on the lower deck and a highway on the upper deck, the bridge was made necessary by the construction of the Shasta dam, located eight miles downstream on the Sacramento river and backing up water to a height of 400 ft.

The new high-level toll bridge (replacing a swing span) over the Thames river, connecting New London with Groton, Conn., a structure 5,926 ft. long with a central cantilever span of 540 ft., was opened to traffic in 1943. Balanced erection over the main piers was used, so as to require a minimum of falsework. It was built at a cost of \$6,000,000 to carry an express highway over the deep tidal estuary of the Thames river.

The largest bridge under construction in the United States in 1946 was the Memphis bridge over the Mississippi, a highway cantilever structure costing \$10,500,000 and having a channel span of 790 ft. For constructing the deep piers, the caissons were sunk by open dredging but were convertible to pneumatic working chambers if required. The caissons were floated out to the site and then sunk through willow mats previously placed to receive them.

The Cooper river bridge at Charleston, S.C., with cantilever spans of 1,050 and 640 ft., built in 1929, had a section of its approach spans wrecked by a ship collision in 1946. For the emergency temporary repairs, resourceful use was made of the Bailey trusses developed and applied in World War II for military bridging.

Steel Arch Bridges.-The Rainbow bridge at Niagara falls, a publicly owned toll bridge replacing the old privately owned arch bridge (the "Honeymoon bridge") wrecked by an ice jam in 1938, was completed in 1941,

with a 950-ft. steel arch span. The new arch was erected with the aid of a cable tieback system, employing the wire rope strands originally used as the temporary footbridge ropes for the Golden Gate bridge. The Rainbow bridge established a new record as the longest arch span with fixed ends; the prior record for hingeless steel arches

Tied arch.

and for arches of the plate girder type was held by the Henry Hudson bridge over the Harlem river, New York .city, with 800-ft. span. One month after the Henry Hudson bridge was opened (Dec. 1936), the addition of an upper deck was authorized to double the traffic capacity, as anticipated by the engineers, and this work was completed early in 1938.

The bridge at Nijmegen (Netherlands) over the Waal river, a two-hinged steel arch of 790-ft. span (longest span steel arch in Europe), was completed during 1946. An ingenious erection method was used for raising the segments of the arch truss, utilizing for temporary support the trusses fabricated for another bridge.

The Middletown bridge over the Connecticut river, consisting of two tied arches of 600 ft. span, was completed in 1938. The foundations for this bridge were sunk by the use of rotating caissons in the form of steel cylinders with toothed cutting edge to penetrate the underlying material, including boulders. A major work completed in 1937 was the Storstrom bridge, built for the Danish state railways, with two-hinged through arches of steel of 460-590-460 ft. in the three central spans. The bridge, two miles in total length, has highway and railway side by side on its deck.

A highway bridge over the Chesapeake and Delaware canal at St. Georges, Del., a steel tied arch of 540-ft. span, for which the tie also acts as a stiffening girder, was built in 1940-41. It replaced a vertical lift bridge wrecked by a ship collision in 1939.

Other steel arch bridges completed during the decade included the following: bridge over the Mississippi river at Rock Island, Ill., five tied-arch steel spans, two at 539 ft. (1940); two bridges of similar design and the same span length of 425 ft. at Orford and Brattleboro, both spanning the Connecticut river between New Hampshire and Vermont (1937); bridge over the Seine at Neuilly, France, steel arch span of 269 ft., longest welded-arch span in the world (1945). The latter structure replaced Jean R. Perronet's famous bridge of stone arches built in 1768-80.

Reinforced Concrete Arch Bridges.-In 1943, all prior records for reinforced concrete spans were eclipsed with the completion of the world's greatest concrete arch, the Sando bridge over the Angerman river in Sweden, with a record-breaking span length of 866 ft. During erection, in 1939, the falsework centring collapsed, with a loss of 18 lives, in the initial stage of the pouring of the concrete. With a new design of centring to assure stability, following scientific studies and tests, the bold span was successfully accomplished.

The world's second longest span of reinforced concrete, the arch at Esla, Spain, with a span of 645 ft., was completed in 1940. The construction was in an advanced stage, scheduled to be completed in 1935, when the Spanish Civil War interrupted the work for five years. The prior record for concrete arches had been held for 11 years by the Plougastel bridge over the Elorn river at Brest, France, with three spans of 612 ft., built in 1929 as a combination railway and highway bridge. One span of this notable structure was destroyed by the Germans in 1944.

The fourth, fifth and sixth longest spans of reinforced concrete arches on record in 1946 were the Traneberg bridge in Sweden with a span of 593 ft., built in 1935; the La Roche-Guyon bridge in France with a span of 528 ft., built in 1937; and the Idefjorden bridge at Svinesund, Sweden, with a span of 509 ft., built in 1942. The seventh in rank of span length was the Lorraine bridge at Berne, Switzerland, a reinforced concrete arch span of 492 ft., completed in 1940. The structure, one mile long, was built by the Swiss federal railways at a cost of 14,000,000 Swiss francs, to provide a four track railroad crossing over the Aare river.

The reinforced concrete arch of 398-ft. span over the Angerman river at Ed, Sweden, built in 1939, typified a new type of arch construction, introduced by O. F. Nielsen, using inclined tension rods for suspending the roadway, the same tension rods serving to brace the arch rib so as to permit more slender construction. This economical type of reinforced concrete arch was used in 1933 for the Castelmoron bridge in France with a span of 470 ft. Similar reinforced concrete arches with suspended roadway were built in Sweden at Tarendo and at Lappeasuando, both over the Kalyx river (394-ft. span), at Hamptjarnskammen over the Ume river (348-ft. span) and at Bergsviken over the Pite river (249-ft. span).

In 1943 the city of Los Angeles completed a \$5,000,000 viaduct project, crossing the Los Angeles river at Aliso street. The channel span is a 222-ft. reinforced concrete arch with six ribs.

Continuous Truss Bridges.—The Sciotoville bridge over the Ohio River, a two-track railroad structure with two spans of 775 ft., completed in 1917, established the continuous truss type in modern bridge practice and held the record as the world's longest span of this type for 18 years until a new record was established by a highway bridge over the Rhine at Duisburg, with a main span of 839 ft., built in 1935 and blown up by the Germans in

In 1942 a new record was again set by the interstate highway bridge across the Mississippi river at Dubuque, Ia.—a continuous through truss of novel design, with 845-ft. central span in the form of a tied arch, and 347-ft. side spans.

The world's third longest span of the continuous truss type in 1946 was another Mississippi river crossing, the St. Louis county bridge, below St. Louis, completed in 1944, with a centre span of 804 ft., flanked by 670-ft. side spans. In 1942 another continuous truss highway bridge was completed over the Mississippi river at Chester, Ill., with two spans of 670 ft. Two years later this bridge was blown off its piers and fell into the river during a violent windstorm. The trusses, 1,340 ft. long and 100 ft. deep over the piers, were spaced only 28½ ft. centre to centre. This bridge failure, like that of the Tay bridge in 1879, was an example of aerostatic instability. It directed the attention of bridge designers once more to the possibility of wind uplift, added to direct horizontal pressure, as well as to the necessity for providing adequate anchoring of bridge spans to piers to prevent sliding, uplift and overturning.

Table V.—Notable Continuous Truss Bridges Completed during 1937-46

A new form of continuous bridge developed and introduced in 1937-41, was the Wichert continuous type, distinguished by the use of linked members forming open quadrilaterals over the intermediate piers. This construction makes the structure statically determinate, so as to be independent of the possible settlement of the supports on yielding foundations. At the same time the economic advantages of the rigid continuous type are retained.

The first bridge of the Wichert continuous type, the Pittsburgh-Homestead bridge over the Monongahela river, was completed in 1937. The 3,100-ft. crossing was constructed of ten semicontinuous arched trusses, including two spans of 533½ ft. Other Wichert-type bridges built later included one over the Susquehanna river at Havre de Grace, Md. (1940), 7,618 ft. long, with 36 Wichert truss and girder spans (longest truss span 456 ft.); one over the Potomac river at Ludlow Ferry, Md. (1941), two miles long, including an 800-ft. cantilever span and 22 Wichert approach spans (longest truss span 350 ft., longest girder span 162 ft.); one over the Potomac river at Hancock, Md. (1939), with 20 Wichert truss and girder spans; and the Wilmot street bridge at Pittsburgh (1940) with three Wichert truss spans (longest 360 ft.).

The Wichert-type bridge built in 1940 over the Susquehanna river at Havre de Grace supplanted the old iron truss bridge near by. This historic structure, after outliving its usefulness as a railroad bridge, was sold in 1910 for \$1, was converted into a highway toll bridge, earned millions of dollars in tolls, was double-decked in 1927, was made toll-free in 1928, and in 1942 was taken down to yield 3,495 tons of scrap metal for the U.S.'s war drive.

Continuous Plate Girder Bridges.—In the United States three successive records for span-length of continuous plate girder bridges were established in a brief period: The Thomas A. Edison bridge over the Raritan river at Perth Amboy, N.J., completed in 1940, with a main span of 250 ft.; the Lakefront bridge at Cleveland, completed the same year, with a main span of 271 ft.; and the Charter Oak bridge over the Connecticut river at Hartford, completed in 1942, with a central span of 300 ft.,

the longest continuous girder span in the U.S.

Still bolder span lengths of continuous plate girder bridges were attained during the same period in Germany. A bridge at Mangfall (1935) had a plate girder span of 354 ft.; a bridge crossing the Elbe (1938) on the Berlin-Halle express highway had a plate girder span of 383 ft.; and a bridge over the Rhine at Frankenthal (under construction in 1939) had a plate girder span of 591 ft. Another bridge (unidentified) was reported to have a girder span of 623 ft., which would make it the longest plate girder span in the world. And the ambitious bridge project at Hamburg, commenced in 1938 and interrupted by the war in 1939, included a proposed continuous plate girder span of 854 ft.

Vertical Lift Bridges.—Completed in 1937, with a span of 540 ft., the Marine parkway bridge between Brooklyn and Rockaway was still, in 1946, the second-longest lift span, exceeded in span length by only four feet in the world's longest lift span, the 544-ft. span of the railroad bridge over Cape Cod canal, completed in 1935. The roadway of the Marine parkway bridge's lift span was made of open grid construction, to reduce weight. Continuous truss approach spans of tapering depth were added for artistic composition.

The President Harry S. Truman bridge, carrying a single-track railroad over the Missouri river near Kansas City, and including a 420-ft. vertical lift span, was completed in 1945.

Bascule Spans.—The world's longest double-leaf bascule span, 336 ft., in the Canadian Pacific railroad bridge over the ship canal at Sault Ste. Marie, built in 1914, collapsed in 1941 under the weight of a passing locomotive. A failure of the interlocking signal system was responsible. In the wartime emergency the span was promptly repaired and reopened to railroad traffic in 1942.

The Erie avenue bridge over the Black river at Lorain, O., completed in 1940, with a double-leaf bascule span of

333 ft., became the second longest in the world. In Chicago, the north State street double-leaf trunnion bascule bridge over the Chicago river (construction, interrupted by the war, was resumed in 1946) was planned for a 245-ft. span, 108 ft. wide, each leaf weighing 4,200 tons. Two other double-leaf bascule bridges on the Lake Shore drive, Chicago, were completed in 1937 with spans of 264 ft. and 220 ft., respectively. The Neches river bridge at Beaumont, Tex., completed in 1941, with a span of 230 ft., became the third longest single-leaf bascule in the world (exceeded by the south Chicago bridge (1913), 235 ft., and the Sixteenth street bridge Chicago (1919), 260 ft.

Concrete Girder Bridges.—A record-breaking concrete girder span of 256 ft. was built in 1938 over the Seine at Villeneuve, near Paris. The Seine crossing at Bry-sur-Marne, a concrete cantilever of 186-ft. span, also completed in 1938, was blown up by French army engineers in 1940. In 1941 it was replaced by a temporary suspension bridge, and rebuilding of the original bridge was begun in 1945, involving the raising of the suspended section of the main span from the bottom of the river.

Construction of the new Waterloo bridge over the Thames in London, England, commenced in 1937 and continued despite the war, was completed in 1942. It consists of five spans of 238 ft., of cellular construction, with piers and spans of reinforced concrete faced with granite and Portland stone. The bridge deck, providing six lanes of traffic, is 80 ft. wide. It replaced the old Waterloo bridge, a famous structure of masonry arches built by John Rennie in 1811–17, which had a roadway width of only 27½ ft.

European engineers recorded outstanding pioneer work in the development of prestressed concrete. To replace bridges destroyed in France during the war, E. Freyssinet built a number of prestressed concrete beam spans of more than 160 ft., with girders only 61/2 ft. deep. The prestressing principle was also used in a highway bridge built at Aue, Germany, in 1936, using a concrete cantilever girder 392 ft. long, with a centre span of 226 ft. A novel feature in this structure was that the adjustable steel tension chord, used to prestress the girders, was not embedded in the concrete.

A bridge at Santa Paula, Calif., a cellular girder of reinforced concrete, with a clear span of 120 ft., was completed in 1940. Its depth of 2 ft. 9 in. at mid-span was a new record for slenderness of such spans.

Timber Bridges.—In 1941 a timber bridge was built at Kiskatinaw, Alaska, with a span of 195 ft., believed to be the second-longest timber span standing. (A 380-ft. timber span was built at Coburg, Ore., in 1926.)

During World War II, emphasis was placed on timber construction, because of the shortage of steel caused by war requirements. A number of timber bridges were built by state highway departments. In 1943 a highway bridge with six 129-ft. truss spans of timber with steel gusset plates was constructed over a channel of the Ohio river near Pittsburgh. This bridge illustrated the use of timber with a small amount of steel to produce a semi-permanent structure.

Pontoon Bridges.—A concrete pontoon bridge across Lake Washington in Seattle, built 1938–40 by the State of Washington Toll Bridge authority at a cost of \$8,850,000, had the floating portion 6,560 ft. long made up of 24 precast cellular reinforced concrete pontoons, 117 to 378 ft. long, 59 ft. wide and 14½ ft. deep, floating 7 ft. out of water, with a central 202-ft. opening for ships provided by a sliding, indrawn floating span.

Another concrete pontoon bridge, completed in 1939 across the Derwent river at Hobart, Tasmania, was novel in design, forming a three-hinged horizontal arch, with the crown of the arch upstream. The arching in plan dispensed with cable anchorages. The entire 3,165-ft. length of the floating arch was designed to move freely up and down with the 8-ft. tides. Each of the two arch segments was made up of 12 cellular pontoons, each 132 ft. long, rigidly united by welding the projecting reinforcement and then concreting. A 30-ft. roadway, a sidewalk and space for a water main were provided on the 40-ft. width. A vertical lift span in the approach was included to provide a clear channel 180 ft. wide and 150 ft. high for navigation.

At Istanbul, Turkey, a steel pontoon bridge 1,500 ft. long, spanning the Golden Horn, was completed in 1939. The 24 pontoons, of steel box construction, 82 ft. wide, 30 ft. long and 12 ft. deep, were spaced 30 ft. apart, supporting a rigid-frame steel superstructure carrying the concrete deck, 52 ft. wide. Passage of vessels was provided for by construction of a centre section of four pontoons moved by tugs and swinging open like a gate.

Military Bridges.—Probably the outstanding contribution of World War II in the development of military bridges was the Bailey bridge, invented by D. C. Bailey of the British ministry of supplies. This remarkably efficient military bridge was designed for assembly from standard units. The basic unit during the war was a 10ft.-long section including trusses, floor beams, stringers and fittings. The capacity of the bridge was increased by adding truss units, both inside and on top of the original trusses, to a maximum of three high, three wide. All connections were bolted, permitting noiseless assembly and erection under cover of darkness. The span was assembled on land and then pushed forward on rollers. A 100-ft. span strong enough to carry 30-ton tanks could be erected in three hours. The Bailey assemblies were used for spans exceeding 240 ft. without a central support.

A spectacular Bailey bridge was built by a U.S. combat battalion in Dec. 1944 to span a deep cut over the Albert canal in Belgium. Bailey truss panels were used to form the 52-ft.-high piers as well as the superstructure with span lengths of 151-152-121-ft. The Unit Construction Railway Truss, developed by the British early in the war, was a precision-built Pratt-type truss that could be quickly erected as a through or deck bridge in span lengths up to 85 ft.

The U.S. army developed the Portable Scissors bridge as a mobile self-launching bridge of 80-ft. span for vehicles and tanks weighing up to 35 tons. The bridge was a 13-ton aluminum girder assembly, hinged at the centre. It was carried in folded horizontal position on a trailer, from which it was mechanically launched by first maising the assembly to a vertical position and then spreading the scissors until the far end rested on the opposite shore. The 80-ft. span could be installed in 15 to 30 min. by six men.

Under security censorship during the war, U.S. engineers developed the Demountable V-type bridge for the speedy replacement of demolished railroad bridges at the

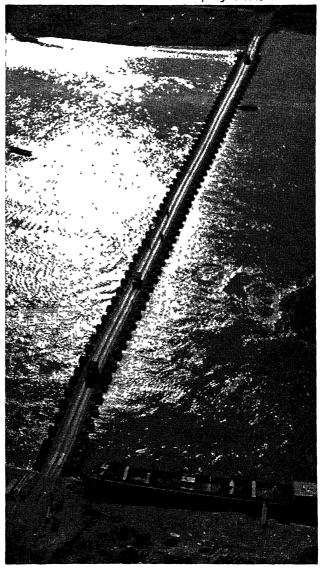

battlefront. Made in standard 10-ft. panel lengths, it could be quickly erected either as a deck or through structure, either square-ended or skewed, of 40-ft. to 90-ft. span for railroad equipment and up to 240-ft. span for highway use.

A development in floating bridges by U.S. army engineers during the war was the M-4 or Division army bridge, made of structural aluminum and designed for vehicle loads up to 50 tons, a greater load capacity than in any previous floating bridge.

For pneumatic pontoons, the M-2 treadway bridge was the heaviest designed during the war and was good for vehicle loads up to 45 tons. The light open-grid treadways, $45\frac{1}{2}$ in. wide, were supported on steel saddles on pneumatic pontoons of rubberized canvas spaced 12 ft. on centres.

For the invasion of Germany in 1945, U.S. army engineers built 14 fixed bridges across the Rhine (5 railroad and 9 highway crossings) and more than 40 floating bridges spanning the river. The railroad bridge over the Rhine at Mainz, dedicated (1945) as the Franklin D.

Bridging the Rhine at Linz, Germany, this road built of pontoon rafts bore a steady roll of trucks and supplies to U.S. 1st army forces east of the river in the spring of 1945

Roosevelt Memorial bridge, 2,200 ft. long, was built in 9 days and 22 hr., breaking Julius Caesar's record of bridging the river in ten days some 2,000 years ago. The record was again broken when another regiment of U.S. engineers built a 2,800-ft. railroad crossing over the Rhine at Duisburg in 6 days and 15 hr. (April 1945).

The longest-span military bridge on record—a suspension bridge of 420-ft. span and 40-ton capacity—was built in 1945 by U.S. army engineers across the Shweli river on the Stilwell (Ledo) highway near the China-Burma border. This type of military suspension bridge was standardized. From the standard equipment, an engineer company could quickly build bridges of any span from 220 ft. to 420 ft., in 20-ft. increments.

Bridge Destruction During World War II.—All of the German bridges over the Rhine, including many world-famous spans, were blown up by the Germans to retard the Allied invasion in 1945. A bridge that made military history, speeding the end of World War II, was the Ludendorff bridge over the Rhine at Remagen, a railroad bridge of 512-ft. main span in the form of a tied arch continuous with 277-ft. side spans. Its quick capture by advance patrols of the U.S. army on March 7, 1945, only ten minutes before the time set for its planned demolition by the Germans, enabled armoured troops and supplies to be poured across the Rhine in a steady stream for ten days before the weakened bridge collapsed. This unexpected crossing of the Rhine shattered the morale of the Germans and accelerated their early surrender.

All of the bridges over the Albert canal in Belgium, including the world's outstanding aggregation of Vierendeel (rigid-joint) truss bridges, were destroyed, mostly by the Belgians themselves, during the German invasion in 1940. One of the bridges, at Hasselt, was wrecked and rebuilt 14 times in the changing fortunes of war. About 5,000 bridges in France were wrecked during

Ludendorff bridge at Remagen after its capture on March 7, 1945, showing U.S. Ist army troops crossing the Rhine into Germany. Failure of the Germans to destroy the bridge gave U.S. forces their first foothold east of the Rhine

the war, many of them a second time after reconstruction in 1943. Fortunately the two dozen beautiful and historic bridges crossing the Seine within the city of Paris were spared from any war damage, but bombs and demolition took their toll of nearly all the bridges outside of Paris. The beautiful and famous bridges over the Danube at Budapest were also destroyed.

Damage to bridges by attack from the air was comparatively small. The Germans dropped more than 1,600 bombs from planes over the world-famous Forth bridge in Scotland without scoring a single hit. Despite the many thousands of bombs dropped by the Germans in the air raids over London, not a single bridge over the Thames was seriously damaged, whereas one of the vehicular tunnels under the Thames was wrecked by an aerial bomb. (See also Roads and Highways.)

British Columbia

British Columbia is the third largest and most westerly of the nine provinces comprising the dominion of Canada. The crown colonies of Vancouver island (1849) and of British Columbia (1858), after uniting in 1866, became the sixth province to enter the Canadian confederation on July 20, 1871. Occupying an area of 366,255 sq.mi., of which 6,976 sq.mi. are water, and lying for the most part between the 49th and 60th parallels of north latitude, the province is bounded on the west by the Pacific ocean, on the south by the states of Washington and Montana, on the east by the province of Alberta, and on the north by Alaska, the Yukon and the Northwest Territories.

The population at the census of 1941 numbered 817,861 persons; approximately 70% (599,783) of whom were residents of the southwestern corner of the province—the lower Fraser valley and Vancouver island regions. The principal ports of Greater Vancouver (1941, 351,491), Greater Victoria (75,218)—the capital, and New Westminster (21,967) are located in the southwest corner. English was the mother tongue for the majority (641,419), but Japanese (21,602), Chinese (18,386), German (15,903), Russian (12,548), Swedish (11,375), French (11,058), Norwegian (10,242) and Italian (9,204) were among the other languages spoken.

Over the decade 1937–46, according to official intercensal estimates, the population steadily increased: 1937, 759,000; 1938, 775,000; 1939, 792,000; 1940, 805,000; 1941 census, 817,861; 1942, 870,000; 1943, 900,000; 1944, 932,000; 1945, 949,000; 1946, 960,000 (estimated).

During the decade 1937-46, the lieutenant governors of British Columbia were as follows:

Eric Werge Hamber (April 29, 1936–Aug. 29, 1941); Lieutenant Colonel William Culham Woodward (after Aug. 29, 1941).

Elections and Ministries.—Three general elections were held during the decade—in 1937, 1941 and 1945. In the election of June 1, 1937, the Liberal government of T. D. Pattullo was returned to power; standing of the various parties in the 19th legislative assembly was: Liberal, 31; Conservative, 8; Co-operative Commonwealth Federation, 7; Independent, 1; Labour 1. Members of the 22nd Ministry (1933–41) and their portfolios were: T. D. Pattullo, premier and president of the executive council (Nov. 15, 1933–Dec. 9, 1941), attorney-general (April 5, 1937–July 5, 1937; Nov. 24, 1941–Dec. 9, 1941), railways (Nov. 15, 1933–Dec. 23, 1937), public works (Sept. 27, 1939–Dec. 5, 1939), finance and education (Nov. 18, 1941–Dec. 9, 1941); John Hart, finance (Nov. 15, 1933–Nov. 17, 1941), indus-

tries (Nov. 15, 1933-Dec. 23, 1937); G. M. Weir, provincial secretary and education (Nov. 15, 1933-Nov. 17, 1941); G. McG. Sloan, attorney-general (Nov. 15, 1933-April 5, 1937); G. S. Wismer, attorney-general (July 5, 1937-Nov. 14, 1941); A. W. Gray, lands and municipalities (Nov. 15, 1933-Dec. 9, 1941); K. C. MacDonald, agriculture (Nov. 15, 1933-Nov. 25, 1941); G. S. Pearson, labour and fisheries (Nov. 15, 1933-Nov. 14, 1941), mines (Nov. 15, 1933-Dec. 23, 1937), railways (Dec. 23, 1937-Dec. 5, 1939); F. M. MacPherson, public works (Nov. 15, 1933-Sept. 27, 1939); C. S. Leary, public works and railways (Dec. 5, 1939–Nov. 14, 1941), trade and industry and mines (Nov. 14, 1941-Dec. 9, 1941); W. J. Asselstine, trade and industry and mines (Dec. 23, 1937-Nov. 14, 1941), labour and fisheries (Nov. 14, 1941-Dec. 9, 1941); N. W. Whittaker, attorneygeneral (Nov. 14, 1941-Nov. 19, 1941); T. King, public works and railways (Nov. 15, 1941-Dec. 9, 1941); F. Putman, agriculture (Nov. 26, 1941-Dec. 9, 1941).

In the election of Oct. 21, 1941, the Liberal administration failed to obtain a majority in the 20th legislative assembly; there were 21 Liberals elected, 14 Co-operative Commonwealth Federationists, 12 Conservatives, and 1 Independent Labourite. Favouring a coalition government and dissatisfied with Premier Pattullo's decision to form a new minority Liberal government, four members of the cabinet resigned. Unable to secure support for his policies, Pattullo resigned as leader of the Liberal party Dec. 2, 1941, and when the legislative assembly convened Dec. 4, he announced the resignation of his cabinet. No legislation was introduced during the single day session of the assembly, which was adjourned until Jan. 8, 1942. Called by Lieutenant Governor W. C. Woodward to form a government, the new provincial Liberal leader, John Hart, announced the formation of a Liberal and Conservative coalition government Dec. 10, indicating that the C.C.F. members had declined an invitation to join in the formation of a union government. The new ministry, the 23rd, comprising eight ministers, included R. L. Maitland, leader of the provincial Conservative party, and two other Conservatives-R. W. Bruhn and H. Anscomb; the remaining five portfolios were held by Liberals. The C.C.F. members of the legislative assembly, under the leadership of Harold E. Winch, constituted the official opposition.

In the election of Oct. 29, 1945, the Coalition government, headed by Premier John Hart (Liberal) and Attorney-General R. L. Maitland (Conservative) was returned to office. Standing of the various parties in the 21st legislative assembly was: Coalition members 37; C.C.F., 10; and Labour, 1. The Co-operative Commonwealth Federation, headed by Harold E. Winch, again became the official opposition. Members of the 23rd ministry (formed 1941) and their portfolios were: John Hart, premier and president of the executive council (after Dec. 9, 1941), finance (Dec. 9, 1941-April 12, 1946), lands (May 11, 1944-Nov. 8, 1944); R. L. Maitland, attorney-general (Dec. 10, 1941-April 4, 1946); G. S. Pearson, provincial secretary, labour and fisheries (after Dec. 10, 1941); K. C. Mac-Donald, agriculture (Dec. 10, 1941-Nov. 19, 1945); A. W. Gray, lands and municipal affairs (Dec. 10, 1941-May 7, 1944); H. Anscomb, mines, trade and industry (Dec. 10, 1941-Oct. 28, 1942), public works and railways (Sept. 15, 1942-April 12, 1946), municipal affairs (May 11, 1944-April 12, 1946), finance (after April 12, 1946); R. W. Bruhn, public works, and railways (Dec. 10, 1941-Aug. 30, 1942); H. G. T. Perry, education (Dec. 10, 1941-Nov.

19, 1945); E. C. Carson, mines, trade and industry (Oct. 28, 1942–April 12, 1946), public works (after April 12, 1946); E. T. Kenney, lands and forests (after Nov. 8, 1944); G. M. Weir, education (after Nov. 19, 1945); F. Putman, agriculture (after Nov. 21, 1945); G. S. Wismer, attorney-general (after April 4, 1946); R. C. MacDonald, mines and municipal affairs (after April 12, 1946); and L. H. Eyres, railways, trade and industry (after April 12, 1946).

Legislation.-During Pattullo's premiership, the 19th legislative assembly held five sessions. Legislation enacted during the first session (Oct. 26, 1937-Dec. 10, 1937) included the following: the Coal and Petroleum Products Control Board act empowered a three-man board to license persons entering the coal or petroleum industry and to fix wholesale and retail prices for their products; the Industrial Conciliation and Arbitration act established formal procedure for the appointment of a conciliation commissioner and, if conciliation failed, subsequently for a three-man board of arbitration in the event of an industrial dispute. Other statutes empowered the minister of agriculture to establish grades for beef carcasses as well as for fruit, vegetables or honey. The Department of Trade and Industry act established a new department comprised of the bureau of economics and statistics, the bureau of trade extension, and the bureau of industrial and tourist development. The Commodities Retail Sales act was passed to prevent commodities from being sold at a price less than the laid-down cost to the retailer, while the Food Products Minimum Loss act prohibited a retailer from selling food products (excluding fresh fruit and vegetables or highly perishable goods) at a price less than 5% above the laid-down retail cost. Other legislation widened the coverage of the mothers' allowances, authorized the Provincial government to establish infirmaries for persons needing institutional care, and covered the administration of the industrial schools for girls and for boys.

Statutes passed during the second session of the 19th parliament (Oct. 25, 1938–Dec. 9, 1938) included the Credit Unions act, which provided for the incorporation and regulation of credit unions; a series of revisions consolidating changes in the mineral laws of the province; the Municipal Improvements Assistance Enabling act, which authorized municipalities to borrow from the dominion government; extensive amendments to the provincial laws affecting municipalities; the Municipal Superannuation act, which was designed to restore the municipal superannuation fund to a solvent basis; the Public Utilities act, which empowered a public utilities commission of three members—subject to the lieutenant governor in council to fix rates, approve the issue of securities, and supervise utility operations.

In the third session of the 19th parliament (Oct. 31, 1939–Nov. 30, 1939) legislation was enacted to exempt members of the Allied forces from certain provisions of the provincial mining laws; the Provincial Elections act thoroughly revised the election procedure; the Public Utilities commission was authorized to grant licences to motor carriers and to prescribe their rates; the Preemptors Free Grants act provided for the issuance of a free grant of land held under pre-emption by persons who subsequently became members of the armed services; and industrial undertakings were required to provide for the semimonthly payment of wages.

A special session of the legislative assembly met May 8-10, 1940; to consider legislation arising from a controversy

between the government and the petroleum industry. The Coal and Petroleum Control board, under the chairmanship of Dr. W. A. Carrothers, issued an order fixing the prices for gasoline effective Oct. 26, 1938; on Oct. 24 certain oil companies commenced an action in the supreme court of British Columbia claiming that the Coal and Petroleum Control Board act was ultra vires. After the court of appeal for province declared the act intra vires; the board, by Regulation No. 10, again fixed prices effective Aug. 7, 1939. On Aug. 5, 1939, the chief justice of British Columbia restrained the board from fixing prices until an appeal could be decided by the supreme court of Canada. On April 23, 1940, the Canadian supreme court declared the statute intra vires, and Regulation No. 10 became effective. On April 26, all oil companies in the province suspended the delivery of gasoline to dealers; after a week of this gasoline strike a compromise settlement was effected establishing the wholesale price of gasoline one cent above the price set in the disputed regulation. Subsequently, in the fourth and special session, the legislative assembly passed the Petroleum Sales act which empowered the government to engage in the petroleum industry or to incorporate companies for that purpose if it should be deemed in the public interest.

Among the enactments of the 19th parliament in its fifth session (Oct. 29, 1940–Dec. 6, 1940) were the following: the Special Assistance in the Cost of Education act provided \$250,000 for distribution in 1941–42 and \$450,000 thereafter, to relieve pressure of the property tax on land for educational purposes; the department of agriculture was empowered to inspect and grade hog carcasses, poultry products and wool; and legislation designed to stabilize the teachers' pension fund.

During the ministry of John Hart's coalition government, the 20th legislative assembly held four sessions and the 21st assembly held its first session. Legislation enacted in the first session of the 20th parliament (Dec. 4, 1941-Feb. 12, 1942) included the Dominion-Provincial Agreement act, a wartime arrangement under which the province temporarily withdrew from the income and corporation tax fields in return for an annual payment of \$12,048,367.51 from the dominion government; the Post-War Rehabilitation act, which provided for the establishment of a council-up to 12 members-which was charged with the task of planning rehabilitation measures; the Coal and Petroleum Act Amendment act (no. 2), which empowered the minister of lands to lease oil-bearing lands to private enterprise and to determine the royalty; and legislation to increase the period from five to ten years. under which a firm might receive an offered provincial bounty on pig iron and steel shapes.

Among the statutes passed by the second session of the 20th parliament (Feb. 2, 1943-March 18, 1943) were the following: the Fraser Valley Fibre Flax Loan act provided an interest-free government loan of \$85,000 to assist farmers to erect a scutching mill-the loan to be repaid in ten years; the Purchasing Commission act established a purchasing commission responsible solely to the legislative assembly in place of the former purchasing agent who had been responsible to the minister of finance; the Workmen's Compensation Act Amendment act increased the benefits available to injured workmen and their dependents; under the Indian Reserves Mineral Resources act, the province settled a long-standing controversy with the dominion over mineral rights by agreeing to share equally the revenue collected from mineral exploitation on Indian reserves; the Free Miners' Exemption act released miners and mining companies, because of war conditions, from

performing assessment work on a limited number of their mineral claims; administration of the old age pension was transferred from the Workmen's Compensation board to a newly-created Old Age Pension board in the department of the provincial secretary.

Some of the measures passed during the third session of the 20th parliament (Feb. 1, 1944-March 15, 1944) were the Liquor Revenue Agreement act, which empowered the government to enter into an agreement with the dominion under which the province was guaranteed a revenue of \$6,368,236.86—equal to the revenue from liquor sales in the year ended June 30, 1942; the Wartime Labour Relations Regulations act, which brought all industrial disputes in the province under the federal wartime conciliation regulations and suspended, in effect, the provincial conciliation measures; the Petroleum and Natural Gas act, which defined the terms under which geological and geophysical surveys could be conducted, drilling performed, and a lease secured upon the discovery of petroleum or gas; legislation authorizing the government to enter into agreements with the dominion for the purpose (1) of carrying out a program of national physical fitness, and (2) of carrying out vocational training; legislation exempting from succession duty the portion going to close kinsfolk of the estate of a deceased serviceman; the Veterans' Land Settlement act, which authorized the reservation of 1,000,000 acres for settlement by veterans under the Dominion Veterans' Land act, 1942; legislation ratifying an agreement with the dominion under which the province undertook to bear 25% of a \$5 increase in the monthly old age pension.

Legislation enacted in the fourth and last session of the 20th parliament (Feb. 6, 1945-March 28, 1945) included the following measures: The Electric Power act, which provided for the establishment of the British Columbia Power commission and authorized the commission to engage in the generation and distribution of electricity throughout the province within the limits of an initial \$10,000,000 expenditure; the Social Assistance act, which defined the responsibility, authority, and the methods for dispensing general assistance or relief through provincial or provincial-municipal channels; the Civil Service act, 1945, which provided for the competitive appointment, classification and promotion by merit, of civil servants; legislation permitting the government to spend not more than \$500,000 for the purpose of acquiring land-clearing machinery for rental to farmers; provision for a \$5,000,000 building program at the University of British Columbia, Vancouver; legislation establishing the forestry branch of the lands department as a separate department.

Among the measures enacted in the first session of the 21st parliament (Feb. 21, 1946-April 11, 1946) were the Public Utilities Act Amendment act, which created a milk board, consisting of one member, with jurisdiction over the marketing of milk; the Consumer Credit act, which authorized the government to introduce regulations covering consumer credit and instalment buying if and when federal wartime regulations were withdrawn; the Public Schools Act Amendment act, which, following the recommendations of the Maxwell Cameron report, provided for the consolidation of school districts into 74 large administrative areas, the levy of a uniform tax of five mills on real estate, and provincial grants-in-aid; legislation permitting the government to increase its advance to the British Columbia power commission from \$10,000,000 to \$20,000,000; the Slum Clearance act, which authorized the government to borrow \$500,000 for the purpose of making grants to those municipalities which, under the

National Housing act, arranged to acquire lands suitable for low-cost rental housing projects; the Coloured Gasoline Tax act, which authorized the use of purple gasoline in certain industrial, farm and fishing equipment; the Gasoline Tax Act Amendment act, which empowered the government to replace the seven cent tax on gasoline used by private vehicles with a ten cent tax-this statute anticipated a three cent reduction in the federal wartime gasoline tax; the Hours of Work Act Amendment act, which established the maximum number of working hours a week at 44 in place of the former 48-hour maximum; the Annual Holidays act, which required every employer—with some exceptions—to provide each employee with at least one week's holiday with pay per year (280 working days); other legislation created a new department of the health and the welfare branches of the department of the provincial secretary. The Constitution Act Amendment act increased the sessional allowance payable to each member of the legislative assembly from \$2,000 to \$3,000.

Dominion-Provincial-Municipal Relations.—These relationships were the subject of frequent intergovernmental discussions during the decade. Conflicting opinions were expressed before the Royal Commission on Dominion-Provincial Relations (the Rowell-Sirois commission), which held hearings in Victoria early in 1938. A brief submitted by associated boards of trade recommended the abolition of provincial governments and legislatures. Tracing the fiscal difficulties of the province partly to the unwelcome necessity of sharing the income tax field with the dominion, Premier Pattullo contended in part that provincial governments should have legal access to indirect taxation and an appropriate share of direct taxation; that some functions such as old age pensions, unemployment relief, and mothers' allowances should be transferred wholly to the dominion; and that the provincial debts should be re-

In Jan. 1941, delegates of the provincial government attended a Dominion-Provincial conference in Ottawa, called to consider the adoption of "plan one," as submitted by the Rowell-Sirois commission. At the conference, Premier Pattullo declined to accept the Sirois plan as the sole basis for discussion on the ground that the plan would, if implemented, place the province permanently in an adverse financial position. The premier, who had been consistently opposed to the suggestion that the provinces should withdraw from the income and inheritance taxation fields in favour of the dominion, also contended that centralization of economic control in the dominion government would be unduly increased under the Sirois plan. Returning to Victoria after Prime Minister King had closed the two-day conference in the face of active opposition from three provincial governments, Premier Pattullo and his Liberal government encountered severe press criticism.

In June 1941, J. L. Ilsley, dominion minister of finance, submitted a compromise wartime plan to all provincial governments. Offering compensation, Ilsley asked the provinces to withdraw from the income, corporation and inheritance (later deleted) tax fields. Subsequently the coalition government of Premier Hart signed a wartime tax agreement in Feb. 1942, under which the province, in return for an annual dominion payment of \$12,048,367.51, temporarily withdrew from the income and corporation tax fields; this agreement was to expire on March 31, 1947.

At the Dominion-Provincial Conference on Reconstruction in Ottawa, Aug. 1945, the dominion government pro-

posed that, at the termination of the wartime tax arrangement, the provinces should remain out of the income and corporation tax fields and vacate the inheritance tax field also for a further period of three years. As compensation to the provinces, the dominion offered to pay a per capita subsidy of not less than \$12 per capita—varying with population and gross national production per capita; to assume the full cost of the existing old age pensions and offer to assist through conditional grants-in-aid a wide social security program; and to co-ordinate dominion, provincial and municipal public investments through a system of planning and timing grants-in-aid. At the Nov. 1945 meeting of the Co-ordinating committee, comprised of federal ministers and provincial premiers, Premier Hart indicated that the provincial government endorsed the full employment and social security objectives advanced by the dominion at the Dominion-Provincial conference in August; that the province would consent to dominion administration of the income and inheritance tax fields if satisfactory financial arrangements could be devised; but that the dominion's financial proposals, as presented in August, were not adequate. As a criterion of adequacy, Premier Hart indicated that the annual compensation should equal the revenue that the province would otherwise collect, at prewar rates, from the relinquished tax fields.

Early in 1946, the dominion government revised the financial proposals originally submitted to the provinces in Aug. 1945. Most interesting to the British Columbia government was the new alternative plan under which the dominion offered to pay, as a minimum, either (1) a variable subsidy of not less that \$15 per capita, or (2) a total sum not less than 150% of the wartime tax payment; the second alternative meant an annual minimum subsidy of \$18,000,000 to British Columbia, as compared with \$9,000,000 originally offered by the dominion in Aug. 1945. At the Dominion-Provincial conference in May, 1946, the position of Hart's government was not announced before the intergovernmental discussions collapsed. Subsequently, in his budget speech of June 27, 1946, J. L. Ilsley indicated that the dominion government was ready to sign individual financial agreements with any or all provinces ready to accept the annual subsidy in one of its alternate forms (minimum \$15 per capita, or 150% of wartime tax payment).

The uncertain outcome of the dominion-provincial financial negotiations had an unsettling effect on provincial-municipal relations during the decade 1937-46. During the depression of the early '30s, the province had reduced grants-in-aid to municipalities and increased their portion of social welfare costs; in addition, the municipalities had been required to pay part of the cost of unemployment relief. Frequent representations were made by the municipalities to the province during the decade for a financial readjustment, and it was contended before the Royal Commission on Dominion-Provincial relations in 1938 that the cost of municipal functions was increasing faster than the revenue from the tax on real property, and that the real property tax represented the only important sources of municipal income and the levies were already excessive. Finance Minister John Hart, in his budget speech of Nov. 10, 1939, stated that the provincial government had restored significantly the grants-in-aid to municipalities; and by assuming the full cost or major portion of certain social services, by granting larger sums for the support of education, he contended that important financial readjustments had been made and further adjustments would be conditioned by the settlement of dominion-provincial financial arrangements. Additional provincial grants-in-aid for education were made in 1941–45.

On Nov. 27, 1944, Dr. Maxwell A. Cameron, professor of education at the University of British Columbia, was appointed sole member of a royal commission to enquire into the incidence of the cost of education. In his report, Dr. Cameron recommended that the system of local school boards be retained and the existing school districts be reformed into larger administrative areas. He also advocated equalized assessments with a basic provincial program, to be financed in part by increased provincial grantsin-aid and a uniform tax of five mills upon real property. A substantial part of the Cameron report was implemented by the Government in the Public Schools Act Amendment act, 1946. Provincial-municipal relations again became the subject of enquiry when on Feb. 16, 1946, H. Carl Goldenberg was appointed sole commissioner to investigate the performance of municipal functions within the province and the fiscal relations between municipalities and the

Commissions of Enquiry.-In addition to the Cameron and Goldenberg commissions previously mentioned, other royal commissions conducted investigations during the decade. Marketing methods of certain fruit agencies, charged with malpractices by Okanagan fruit growers, were investigated by the dominion combines commissioner, F. A. McGregor, during the summer of 1939. In July 1941, G. McG. Sloan, later justice of the court of appeal, was appointed commissioner to enquire into the administrative policy of the Workmen's Compensation board; in his report of Sept. 1942, Justice Sloan reported that the Workmen's Compensation act had been efficiently administered and suggested a moderate expansion of its coverage as well as upward adjustments in the scale of compensation. On Sept. 30, 1941, Judge A. M. Harper was appointed sole member of a royal commission to enquire into the administration of the marketing boards constituted under the National Products Marketing (British Columbia) act. On Dec. 31, 1943, Justice Sloan was again appointed a commissioner to investigate the utilization and conservation of the forest resources; the major change to established policy contained in his report—released in Feb. 1946—was a recommendation that the forest service should be transferred from the department of lands to the jurisdiction of an independent forest commission, which would be responsible for forest planning and administration, and would disburse forest revenues without direct reference to the government or the legislative assembly. In Nov. 1944, in addition to the Cameron commission, two other enquiries were authorized; J. A. Grimmett was appointed a commissioner to investigate the operation of societies offering accident or sickness benefits; A. J. Cowan was empowered to investigate the operation of life insurance clubs. On May 11, 1946, E. T. Kenney, minister of lands and forests, announced that Dean Frederick M. Clement, head of the department of agriculture, University of British Columbia, had been appointed a commissioner to enquire into the ability of the irrigation, drainage and dyking districts of the province to repay their indebtedness to the provincial government.

Other Events.—The depression had not lifted completely at the beginning of the decade, and gave place to a war-induced prosperity at the close. There were some weeks of disturbances in June and July 1938, when a body of unemployed occupied buildings in Vancouver and Victoria. Campbell river, on Vancouver island, was the scene

of a disastrous 75,000-acre forest fire in July 1938. The spring of 1939 saw the opening of a provincial exhibit at the Golden Gate International exposition in San Francisco, Calif., and the appointment of two provincial representatives on the Canadian section of the International commission studying the proposed British Columbia-Alaska highway; in May, the new Vancouver hotel in Vancouver opened under the joint management of the Canadian National and Canadian Pacific railways. The most colourful event of 1939 came in June, when King George VI and Queen Elizabeth visited the province in the course of a nation-wide tour. Favourable geological reports from the Peace river area prompted the provincial government-after the outbreak of World War II in Sept. 1939—to embark on unsuccessful oil drilling operations, which were carried out during 1940-42. Also in 1941 the Duke of Kent visited the province,

and the coastal cities experienced their first "blackout" (Dec. 8). Early in 1942, the dominion government expelled all Japanese fishermen from that industry and gradually removed members of this racial group from strategic coastal areas. On Oct. 21, 1942, the new Royal Canadian Naval college at Royal Roads, Esquimaltnear Victoria-was commissioned. Completion of the U.S.-Canada military highway through northern British Columbia to Alaska was announced in November. In 1943, the Public Utilities commission required the British Columbia Electric Railway Company, Limited, to supply free electric service for one month in Vancouver and lower mainland areas, and two months in other parts of the province served by the company; this regulatory device was repeated in 1944. The future of the provincially-owned Pacific Great Eastern railway in the development of northern areas was referred, in 1945, by Premier Hart to a joint committee comprised of dominion, British Columbia, Alberta, Canadian Pacific and Canadian National railways representatives. Also relevant to northern development was the award of contracts in July 1945, calling for the completion of a 251-mi. road between Dawson creek on the Alaska highway and Prince George: construction pro-

British East Africa

Under this heading are grouped British possessions on the east coast of Africa, namely: one colony (Kenya), one mandated territory (Tanganyika), and four protectorates (Uganda, Nyasaland, Zanzibar and British Somaliland). For reasons of geographical logic the island colonies of Mauritius and Seychelles are also described here.

Kenya.—Area 224,960 sq.mi.; pop. (est. 1944) 3,940,000 of whom 32,000 were Europeans, 61,000 Asiatics and 19,000 Arabs (1940 census, 3,534,862). Chief towns: Nairobi (cap.; pop. est. 1939, 65,000), Mombasa (57,300). Languages: English, Swahili, Bantu and Nilotic dialects.

Governors: Air Chief Marshal Sir Robert M. Brooke-Popham (Nov. 1936–Oct. 1939); Sir Henry Monck-Mason Moore (Oct. 26, 1939–Sept. 1944); Major-General Sir Philip Mitchell (after Sept. 19, 1944).

Tanganyika.—Area (not including water area) c. 342,700 sq.mi.; pop. (est. 1944) 5,498,600 of whom 16,100 were Europeans and 46,500 Asiatics. Chief towns: Dar es Salaam (cap., pop. 33,500), Tabora (25,000). Languages: English, Swahili, Bantu and Bushman dialects. Religions: Christian, pagan.

Governors: Sir Harold MacMichael (Jan. 25, 1934-37); Sir Mark A. Young (March 4, 1937-41); Sir Wilfrid E. F. Jackson (June 19, 1941-45); Sir William D. Battershill (after April 28, 1945).

Uganda.—Area (including the kingdom of Buganda but excluding the water area) c. 80,300 sq.mi.; pop. (est. 1944) 3.956,654 of whom 2,553 were Europeans and 27,573 Asiatics; among the Africans c. 910,000 were Boganda. Chief town: Entebbe (cap., pop. c. 7,300). Languages: English, Swahili, and mainly Bantu dialects. Religions: Christian and pagan.

Governors: Sir Philip E. Mitchell (Oct. 1935–40); Sir Charles Dundas (July 8, 1940–44); Sir John Hathorn Hall (after Sept. 19, 1944).

Nyasaland.—Area (land only) 36,829 sq.mi.; pop. (est. 1944) 2,188,000 of whom 1,812 were Europeans and 2,200 Asiatics (1940 census, 1,686,045). Chief towns: Zomba (cap., 3,000), Blantyre (6,000). Languages: Chinyanja, English and native dialects. Religions: Christian and pagan.

Governors: Sir H. B. Kittermaster (1934-39); Sir Henry C. D. C. Mackenzie-Kennedy (Feb. 24, 1939-42); Sir Edmund Richards (after June 5, 1942).

Zanzibar.—Area: Zanzibar island 640 sq.mi., Pemba island 380 sq.mi.; pop. (est. 1944) 250,000 (1941 census, 243,-296). Chief town: Zanzibar (cap., 50,000). Languages: Arabic, Swahili and English. Religions: Mohammedan and Christian.

Residents: Sir R. S. D. Rankine (Dec. 1929–37); Sir John Hathorn Hall (Sept. 1937–40); Sir Henry Guy Pilling (Dec. 23, 1940–45); Sir Vincent G. Glenday (after March 3, 1945).

British Somaliland.—Area: 67,936 sq.mi.; pop. (est. 1944) 700,000. Chief towns: Hargeisa (cap., 20,000), Berbera (20,000). Languages: Somali and Arabic. Religion: Mohammedan.

Governors: Sir Arthur Lawrence (June 18, 1932–39); Sir Vincent G. Glenday (March 2, 1939–41); (military administration) Brigadier A. R. Chater (March 1941–43); Brigadier G. T. Fisher (after Feb. 1943).

Mauritius.—Area: 720 sq.mi.; pop. (census 1944) 419,185 in Mauritius proper and 13,463 in the dependencies. Chief towns: Port Louis (cap., 66,469). Languages: French and English. Religions: Roman Catholic 141,941; Protestant 4,165; the rest Hindu or pagan.

Governors: Sir Wilfrid E. F. Jackson (March 7, 1930-37); Sir Bede E. H. Clifford (May 21, 1937-42); Sir Henry C. D. C. Mackenzie-Kennedy (after July 5, 1942).

Seychelles.—Area: 156 sq.mi.; pop. (est. 1943) 33,600. Chief town: Victoria (cap., 5,500). Languages: French and English. Religion: Christian.

Governors: Sir Arthur F. Grimble (1936–42); Sir William M. Logan (after Jan. 5, 1942).

* * *

By 1937, Italy had occupied Ethiopia. One-third of the European population of Tanganyika was German, and there was a body of opinion in Britain which favoured the return of Tanganyika to Germany. East Africa therefore was war-conscious. At the outbreak of World War II, all German nationals were interned, rather surprisingly without incident. The East Africa force was formed in Nairobi under the command of Major-General D. P. Dickinson, whose foresight was responsible for the creation of a highly mobile force admirably suited for the campaign against the Italians which was successfully carried out in 1941 by General Sir Alan Cunningham. The prewar strength of the East African military forces was under 1,500, with a spe-

cial reserve and a reserve of officers. In Kenya, there had been conscription for Europeans for some years; there were also volunteer units of the army and navy as well as a volunteer women's auxiliary unit. Out of Kenya's prewar European population of under 20,000, more than 3,500 men served with the forces, and 57% of the women were engaged in full-time employment.

Voluntary recruiting of Africans met with immediate and wholehearted response in all the territories. In the war years, Kenya supplied 100,000 men; Tanganyika 90,000; Uganda 70,000; and Nyasaland 30,000. They were rapidly trained for all branches of the land forces, and the training of African artisans at one time reached an output of 1,000 a month. Two divisions were in the field by the end of 1940. East African troops under British officers served with distinction in the campaigns in Ethiopia, the middle east, Madagascar, and Burma, where 50,000 took part in operations against the Japanese. Mauritius and Seychelles also contributed engineers and artisans to the British forces. Casualties in the East African forces in killed and died of wounds were: African 1,516, Europeans 81.

From Dec. 1942 to Oct. 1943, the eastern fleet had its base in Mombasa. East African command, formed in 1941, at one time covered 2,000,000 sq.mi. and maintained 22,000 mi. of communications. Subsequent general officers commanding in chief, East Africa, were: General Sir William Platt, 1941–44; Lieut.-General Sir Kenneth A. N. Anderson, 1945; and Major-General William A. Dimoline, 1946.

Meanwhile, in the years 1939–44, there had been a drive to increase production of all commodities needed for war, in which both European and African farmers played their part. Despite the absence of men in service, the acreage of flax was increased fivefold; of wheat threefold; of barley twofold. Production of timber was raised to four times its normal output; bacon was trebled; and butter doubled. Pyrethrum, an insecticide, became Kenya's most valuable export, while in Tanganyika nearly 5,000 ac. were planted during the war. Increases in sisal and many other commodities were also recorded. In the Kikuyu native reserve in Kenya, two dehydration factories had a capacity of 80 tons of fresh vegetables per day.

An enormous strain was placed upon the railways in Kenya and Tanganyika, coupled with great difficulties in maintenance. During World War II traffic increased in some cases to 350% of normal, while the port at Mombasa was called upon to deal with 40% above the prewar tonnage. Two new deep-water berths which took two years to build were completed in 1944. The railway and harbour workshops took on the manufacture of armoured cars, land mines and trench mortars.

An East African industrial council with a research committee was formed to foster the manufacture of articles and materials which could not be imported, such as pottery, building materials, fuel oil from cotton seed, soap and edible oil. Though they served a most useful purpose in wartime, it was doubtful if they would prove economic on a large scale in normal times.

The civil governments took over responsibility for all demobilized men, and schemes for rehabilitation, resettlement and training were prepared. Agricultural and technical training was provided for Africans on a large scale. Settlement committees for both Europeans and Indians were formed. An agricultural school for Europeans existed before World War II at Njoro in Kenya, and one for Asiatics was being built in Tanganyika. To finance 500 new settlers in Kenya, a sum of £1,600,000 was made available.

As a result of World War II the outlook of the African

British East African pioneers practising grenade throwing as part of their training. Pioneers contributed valuable services during the North African campaigns of World War II

soldier changed considerably. He saw other lands and was trained to do highly-skilled work. An education corps was very active in all units; Africans attended lectures, listened to vernacular broadcasts, and saw propaganda and entertainment films. Free postage for all in the service encouraged literacy. Army rates of pay were from three to ten times as high as those paid for casual labour in peacetime, apart from all the extras in food, clothes and other facilities. It was natural, therefore, that the African soldier should not want to return to peasant farming. The greatest number wished to become traders; others wanted to be artisans or clerks. In all these occupations Africans found themselves at a disadvantage in competition with the established Indians. It had been realized for several years that increased Indian immigration obstructed the progress of the Africans, but until all immigration was controlled during the war no restrictions had been imposed. In 1946, a measure was proposed by the British government by which capital requirements of non-native intending immigrants was fixed at £800 for farmers, £1,000 for miners, £2,500 for traders, and up to $f_{10,000}$ for industrialists.

With the increase in education, the African developed a political consciousness. An African study union was formed where debates on matters of topical interest were held. African newspapers also increased. In Kenya there were eight in 1946 where there was only one in 1939, and the combined circulations amounted to 85,000.

The first African to sit in an East African legislature was appointed in Kenya in 1944. Up to 1946, two had been nominated in Tanganyika and three in Uganda.

Education of African children was provided by government schools and schools of Christian missions, in many cases aided by the government. In spite of the difficulties of wartime, the scope of these institutions increased. Postwar schemes in all the territories included generous provisions for improvement of educational services. The college for higher education of Africans at Makerere in Uganda, which accepted students from all territories, was raised to the status of a university college as a result of the visit of a commission on higher education which visited Uganda in 1937. Arrangements were being made for its expansion

to full university status. In 1946 it accommodated 161 students, of whom 73 were from Uganda, 37 from Kenya, 34 from Tanganyika, 13 from Zanzibar and 3 from Nyasaland.

Large schemes for development and reconstruction were under consideration in all the East African territories, and ten-year plans were formulated. The Colonial Development and Welfare act of 1945 made large sums of money available for these purposes from the British government, which were augmented by the financial resources of the territories. The government grants, apart from research, were: Tanganyika £5,250,000; Kenya £3,500,000; Uganda £2,500,000; Nyasaland £2,000,000; British Somaliland £750,000; Zanzibar £750,000; and Seychelles £250,000. The money was to be spent on such services as education, medical services, agricultural and fishery development, water supplies, African housing and communications.

Conscription of African labour, introduced as a war measure, was permitted only for essential services and essential war production. In Tanganyika, 80,000 men were so conscribed and in Kenya 60,000. The period of service ranged from two months to one year. In Sept. 1946, conscription ceased.

The catastrophic loss of soil fertility in almost all native areas, resulting from wrong methods of cultivation and overstocking, was a matter of grave concern during the years 1939–46. A campaign started in 1931 received insufficient financial support from governments and little cooperation from the natives. The situation became rapidly worse, and large areas of land were thought to be beyond reclamation. Millions of pounds would need to be spent on soil conservation after 1946.

The spread of tsetse fly, particularly in Tanganyika and Uganda, also caused alarm. In the former territory two-thirds of the country was affected, and though in the years 1937–46 some 1,150 sq.mi. were cleared other areas became infested. New methods of dealing with the problem were being tested.

In all territories expenditure and revenue increased. These figures and those of exports and imports are shown in the accompanying table:

	Year	Revenue £	Expenditure £	Imports £	Exports £
Kenya	1937	3,668,000	3,566,000	5,181,000	3,954,000
	1944	7,734,000	7,629,000	8,610,000	5,793,000
Tanganyika	193 7	2,345,000	2,174,000	3,783,000	5,311,000
- ,	1944	4,207,000	4,193,000	5.829.000	7,430,000
Uganda	1937	1,960,000	1,754,000	3,556,000	5,703,000
	1944	2,658,000	2,598,000	2,813,000	7,531,000
	1945	· <u></u>	_	3,281,000	9,939,000
Nyasaland	1937	545.000	692,000	863,000	887,000
.,	1944	1,029,000	1,038,000	1,713,800	1,502,000
	1945		-	1,580,000	1,876,000
Zanzibar	1937	495,000	486,500	1.229.000	663,300
	1944	639,000	565,000	1,249,000	1,174,000
British Somaliland	1937	258,000	213,000	288.000	276,000
	1942	216.000	189,000		
Mauritius	1937	1.194.000	1,162,850	2,567,025	2,706,075
	1944	2.603.475	2,386,800	4,927,950	3,471,975
Seychelles	1937	94.725	112,725	94,725	112,650
,	1945	94,800	86,700		

The war department spent vast sums in the territories during 1939–45, £120,000,000 in Kenya alone. Over £10,500,000 was subscribed to East African war bonds up to the end of 1945. The formation of East African airways to operate trunk and local services in association with British Overseas Airways Corporation was agreed upon in 1945. This necessitated a new airport in Nairobi at a cost of £1,000,000. Another airport was to be built in Livingstone, Nyasaland, at a cost of £250,000.

The need for co-ordination in the territories was more apparent during the war than before. The weaknesses of the conference of East African governors, the existing co-ordinating body, led the British government to issue a

White Paper in 1945, outlining a proposal which was issued for discussion, by which a high commission, a central legislature, and an executive organization supported by advisory boards would administer the services common to Kenya, Tanganyika and Uganda. Much controversy was caused by the proposal of racial equality as between Africans, Europeans and Indians in territorial representation.

The undersecretary of state for the colonies, A. Creech Jones, visited the East African territories in July 1945.

Kenya.-In 1937, income tax was introduced into Kenya and in the first year produced £100,000 in revenue against an estimate of £43,000. In the following year the Native Lands Trust bill was passed. This defined native areas in accordance with the recommendations of the Carter commission. Progress in African education continued in spite of the war. Between 1937 and 1945, the number of African children attending school rose from 100,872 to 124,185. Local native councils assumed responsibility for day schools in the reserves in 1943. To restrict speculation in land, the land control board was appointed in 1944. It had substantial nonofficial representation and wide powers. Changes were made in the administration by regrouping departments and by the appointment of a deputy chief secretary, in order that the chief secretary might devote himself to reconstruction. The close association of nonofficials with government on the numerous boards and committees that were formed in connection with the organization of supplies, price control, food rationing, etc., resulted in the appointment of a nonofficial to the post of secretary for agriculture, animal husbandry and natural resources.

Kenya's reconstruction program of 1946 included the following expenditure: agricultural development £1,500,000; reconditioning African lands £3,000,000; European settlement £1,600,000; education £2,344,000; roads £1,250,000 and buildings £1,500,000.

Tanganyika.—In 1939, income tax for non-natives was introduced as a wartime measure, but later was adopted as a permanency. An economic control board was set up in 1942 to co-ordinate production and supplies. After the fall of Singapore, experts in rubber production were sent to bring the old rubber plantations, planted by the Germans, into production and to explore the possibilities of wild rubber vines. A research laboratory was set up in Amani. In 1946, Tanganyika came under United Nations trusteeship, and some disappointment was expressed locally that it had not been made a colony. It was also decided that former axis properties should be taken over against reparations and allocated for native and non-native settlement. A commission visited the territory in the same year to make proposals for a scheme for the production of groundnuts on a large scale, involving 700,000 ac.

The Aga Khan was weighed in diamonds in Dar es Salaam to celebrate his diamond jubilee in Aug. 1946.

Uganda.—In 1939, the kabaka (king) of Buganda died and was succeeded by a lad, Mutesa II. During his minority a regency of three prominent Baganda was set up. In 1942, the queen mother married a commoner, causing much controversy as a result of which a minister, Nsibirwa by name, was forced to resign. There were serious disturbances in the protectorate, chiefly in Kampala, early in 1945, with some loss of life and damage to property. They took the form of a strike, but subsequent inquiry by the chief justice attributed them to political intrigue, suspected of being from the same source as that which caused the resignation of Nsibirwa. The rioting took the government entirely by surprise, and most of the senior officers were away at

Royal African troops on the border of Kenya and Italian Somaliland in 1941. They are shown moving back part of the stone boundary erected by the Italians to mark their briefly held colonial frontiers in East Africa

the time. A detachment of the king's African rifles restored order. As a result of the affair, another minister who had previously been a regent resigned, and Nsibirwa was recalled to the post of prime minister. Later in the year he was assassinated by an African. In 1946, the young kabaka was a student at Magdalene college, Cambridge, England. Uganda's main product, cotton, accounted for 71% of total exports in 1945. Production declined during the years of World War II. Arrangements were made for the establishment of a central cotton research station by the Empire Cotton Growing corporation with a financial contribution from the colonial office. The protectorate in 1946 had 2,500,000 head of cattle and 3,250,000 sheep and goats.

Nyasaland.—In 1937, a commission of inquiry into the possibilities of closer association between Nyasaland and the Rhodesias visited the protectorate. Afterwards proposals for the amalgamation of the territories were made, but up to the closing months of 1946 had not been accepted. A very large number of natives were leaving their country for work in the mines in Rhodesia and South Africa. Anxiety was felt that too few able-bodied men were left in their villages for the healthy development of the country.

Recruiting for the mines in South Africa was restricted during the war.

Representatives of Nyasaland took part in the Central African council, an advisory body set up in 1944. African provincial councils were formed in 1944 with such success that an African protectorate council was established. The first woman member of the legislative council was appointed in 1946.

Development schemes for the years 1946-56 included allocations as follows: education £1,869,376; health £1,814,304; agriculture £1,254,192; roads £1,075,000; air transport £309,790; and posts and telegraphs £220,968. The building of a technical school was also proposed at a cost of £250,000.

Zanzibar.—In 1938, the government decided to spend £200,000 to relieve debt in the colony. At the outbreak of war, the sultan placed his resources at the disposal of the British, and broadcast in support of the Allied cause. Extensive planting of food crops was carried out to meet war needs, but in spite of this the crop of cloves, Zanzibar's chief export, was a record. Students in social welfare were sent to the London school of economics for training in 1943.

The bi-centenary of the Al Busaid dynasty was celebrated in 1944.

British Somaliland.—In 1939, a severe drought necessitated the issue of famine relief. At the outbreak of World War II, the Somaliland camel corps was not under command of East Africa force, but under the French general in Jibuti. After the fall of France, the protectorate was reinforced by two battalions of East African troops, one British regiment and some Indian troops. Against vastly superior Italian forces they held out for six days until orders to evacuate were received. This was accomplished without interference. The protectorate was reoccupied in March 1941, and Berbera became the main supply port for the attack on Addis Ababa and the occupation of southern Ethiopia.

Much progress was made in education and medical services, including clinics, by the military government which was administrating the country after the reoccupation. An experiment in date planting was made.

Mauritius.—In 1938, a dockers' strike caused some disturbance as a result of which the ringleaders were deported to Roderigues island. In the following year the local Labour party was suppressed. The colony experienced a severe drought in 1939 which caused losses of £750,000. A department of education was created in 1941, and students in social welfare were sent to the London school of economics for training two years later. A good yeast factory was established in the colony in 1944.

British Guiana

A British crown colony in northeastern South America, British Guiana is bounded on the north by the Atlantic ocean, on the east by Dutch Guiana (Surinam), on the south by Brazil, and on the west by Brazil and Venezuela; it is located between 1° and 8° north lat. and 57° and 61° west long. Area, 89,480 sq.mi.; pop. (1931 census), 310,933. Later official estimates of population were as follows: (1938) 337,521; (1939) 341,237; (1940) 346,982; (1942) 361,754; (1943) 364,694. Racial groups in the population include 159,249 East Indians, 135,364 Negroes, 9,419 aborigines, 8,361 Portuguese and 3,557 Chinese (1943 ests.). The East Indian fraction is numerically greater than in any other American area except Trinidad and proportionately more than in any except Dutch Guiana. Despite the relatively slow growth of the population, the British Guiana Refugee commission reported that the colony could support "at least a million additional population." The capital and principal city is Georgetown (1943 pop. est., 73,171, of whom only about 1,400 were white). The settled area is largely along the Atlantic coast and the banks of the Essequibo and Demerara rivers and it has been estimated that as much as 64,000 sq.mi. of the whole area of the colony is almost entirely unexplored. Executive power is vested in a governor, assisted by an executive council and a legislative council, the latter body including 24 members, 3 of them officials and 21 nonofficials, 7 nominated and 14 elected. The colony is for some purposes regarded as part of the British West Indies and the tendency continued during the decade to move toward a closer administrative amalgamation of it with other British colonies in the Caribbean area. Governors during the decade 1937-46: Sir Wilfred F. Jackson, until July 4, 1941; Sir Gordon James Lethem, after that date.

British Guiana and its possibilities for development had been virtually ignored by the imperial government until events in 1937 compelled a closer attention on the part of the mother country. Serious labour disorders in that year in British Guiana, Trinidad, Jamaica, and elsewhere in the British West Indies brought about the appointment

in 1938 of a West Indies royal commission, under the chairmanship of Lord Moyne, to study social and economic conditions in the British colonies in tropical America. The commission made an exhaustive study, publishing its report in part in Feb. 1940. The commission's recommendations dealt mainly with the area as a whole. Despite wartime conditions, some of the proposals were embodied in the Colonial Development and Welfare act passed by the British parliament in July 1940. Under authority of this act, previous imperial loans totalling £190,149 made to the colonial treasury were written off, and an immediate grant of £52,000 for drainage and other developmental projects was made.

In the meantime, in the latter part of 1938, the British government had made a tentative offer of lands in the interior of British Guiana as a possible site for settlement of involuntary refugees from Europe, and in Feb. 1939 the British Guiana Refugee commission, which included experts on colonization, tropical diseases and sanitation, highway engineering, agronomy, soil ecology, and other aspects of tropical agriculture, made aerial and land surveys of three sections of the colony totalling more than 40,000 sq.mi. in extent. The region involved principally that south of lat. 5° and west of the Essequibo river, the corresponding areas east of that river and the northwest district. On the basis of this and other previous studies, the commission submitted a report which, in summary, declared that while not "ideal" for middle Europeans and not suitable for "immediate large-scale settlement," there were soils suitable for permanent agricultural exploitation and that natural resources made possible a correlated industrial development. The commission recommended immediate trial settlements of 3,000 to 5,000 young colonists, aided by skilled technicians. The cost of settlements of 5,000, including transportation to British Guiana, was roughly calculated at \$3,000,000 for two years. The Kanuku mountain district in the south was regarded as the bestsuited area of all those studied. Recommendations for an industrial centre in the vicinity of Bartica and for development of transportation routes into the interior were also made. The additional 1,000,000 people which the commission estimated the colony could support was arrived at on the basis of conservative estimates of 5 ac. of productive land per person (twice the usually accepted

standard), plus adequate financing and proper technical direction and supervision. These conclusions presumed a balanced and roughly self-sufficient economy carried on entirely by whites. Preparations for the proposed trial settlements were begun, but the outbreak of World War II in Europe in Sept. 1939 forced an indefinite postponement of the plans. Large-scale development proved impossible thereafter under wartime conditions.

The agreement between President Roosevelt and Prime Minister Winston Churchill in the summer of 1940, formalized by an exchange of notes dated Sept. 2, 1940, to exchange 50 U.S. over-age destroyers for 99-year leases on eight general sites in British Atlantic possessions, to be used by the U.S. as naval and air bases, involved British Guiana as the southernmost of those sites. Late in 1940, U.S. naval experts visited British Guiana to select a specific site for such developments in that colony. It was ultimately decided to establish a seaplane base near Suddie at the mouth of the Essequibo river and a patrol plane and squadron base (subsequently named Atkinson field) on the Demerara river, 25 mi. from its mouth; the latter had an aerodrome of 4,708 ac. The U.S. undertook active construction work in 1941 and formally took over the bases in July of that year. Base installations in British Guiana were not as strategically important as those in Trinidad, but they served to complete the southern extension of the arc arranged for Panama canal defense.

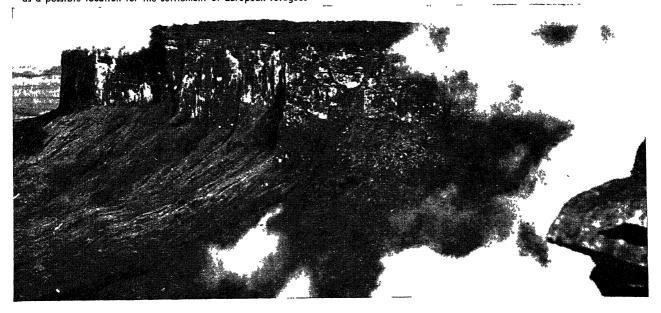

British Guiana felt relatively little political repercussion from the advent of the war in Europe, but economic consequences were considerable and serious. The chief early effects were the reduced exports of diamonds and certain other products; on the other hand, bauxite and sugar production and exports were considerably stimulated. Heavy wartime demands for aluminum made the extensive bauxite deposits of British Guiana among the most important strategic resources in the hemisphere. The violent fluctuations in British Guiana economy brought about by the war resulted in the extension of additional financial aid from the British treasury at various times. The colony, on its part, was responsible for increasingly large-scale contributions and loans in support of the im-

Terrain in the Mt. Roraima region of British Guiana inhabited by a "lost tribe" which was discovered by U.S. zoologists conducting an expedition there in 1939. The uncultivated area was suggested as a possible location for the settlement of European refugees

perial war effort. The imperial treasury in 1942 allotted a grant of \$400,000 for drainage and irrigation works to extend rice production. This meant that British Guiana, already the chief rice-producing area of South America and with 72,000 of its estimated 155,000 ac. of cultivated land devoted to that crop, might become an even more important factor in hemispheric rice production. U.S. need for rubber after 1941 resulted in the resumption of rubber production in British Guiana the following year, after an 11-year lapse. Technical assistance was provided by the U.S., who guaranteed purchase of all production through 1946 and offered a production bonus. The colonial government in 1945 aide \bar{d} in the establishment of a new industry, that of the manufacture of food yeast and animal yeast, undertaken on an experimental basis at Plantation Leonora. Consideration was also given to the establishment of a glass-manufacturing industry.

The chief obstacle to both agricultural and industrial development throughout the colony continued to be lack of transportation, both by railway and highway. No external land communications were available, although the visit to British Guiana in April 1942 by the governor of the Brazilian state of Amazonas served to focus attention again on the long-discussed proposals for a railway from the colony's border to Bôa Vista in Brazil. Attention was given the following year to the possible construction of a highway link connecting the colony with Brazil. Nothing tangible developed from either proposal during the decade. The government in 1945 was planning an extensive road-building program for the interior of the colony.

British Guiana was increasingly feeling the strain of war disruptions of trade and shipping by 1942, but was able to withstand the ill effects better than were her sister colonies in the West Indies. This was largely the result of the self-sufficiency program begun early in World War II. Government control of gasoline and power alcohol, subsidies for production of certain staple foods, and stringent restriction of nonessential imports were effected, however. The economic situation was aggravated in 1943 by prolonged rains and floods, the January-March rainfall being the heaviest recorded after 1880. Offsetting this

was the increasing attention being paid by that time to long-term and postwar development. Thus, imperial loans and grants were made in 1943 for drainage and irrigation projects aggregating £118,584, and for extension of the cattle industry, an airport at Georgetown, land settlement and other purposes. Moreover, the colonial office in London indicated that a "considerable number of largescale proposals" for British Guiana development were under discussion. The pace of long-range development planning under imperial colonial development grants was stepped up in 1944. These grants included a 20-year irrigation and drainage program involving 500,000 ac. and costing \$12,000,000, a \$3,000,000 wasteland development project along the Courantyne river and similar smaller projects, further government aid for the mechanization of rice cultivation and a \$200,000 airfield at Mackenzie. The government further stimulated air services in 1944 with the granting of subsidies for the inauguration of air services biweekly to the Mazaruni region and monthly to the Rupununi. A colonial-accumulated treasury balance of \$5,760,000 at the beginning of 1944 was held in reserve, earmarked against postwar adjustment difficulties. Government subsidies proposed for 1945, partially as a wartime measure for controlling living costs, amounted to \$1,931,925; the legislative council in 1945 appropriated \$996,240 for improvement of the rice industry. The government in 1945 gave much encouragement to farmers in

the selection of better seed, as well as in planting irrigation and drainage, in the hope that increased crop yields might soon make the colony almost self-sufficient in food.

Considerable political discussion occurred toward the close of the war period over the possibility of closer administrative and political union with near-by British colonies. British Guiana, after 1940, shared with the insular Caribbean colonies and British Honduras a common comptroller for development and welfare, along with advisers in special fields. British Guiana also fell within the jurisdiction of the Anglo-American Caribbean commission, created on March 9, 1942, to deal especially with "matters pertaining to labour, agriculture, housing, health, education, social welfare, finance and related subjects in territories under British and United States flags." Modification of the commission's organization and activities in 1945 to include participation by French and Dutch governmental representatives brought British Guiana into closer potential contact with Dutch Guiana and French Guiana. British Guiana sent representatives to the important West Indian conference held at Bridgetown, Barbados, from March 21 to March 30, 1944. The conference discussed projects for fisheries development (a matter which the British Guiana government in 1945 specifically sought to encourage), longterm public works construction by means of regional planning boards and an international planning commission as a subsidiary of the Caribbean commission, the betterment of standards of living and the increase of local food production, postwar industrial development, and

other problems. The conference proposed the development of secondary industries where practicable and suggested economic surveys and development of resources and transportation in British Guiana as well as else-

where. Oliver Stanley, minister for the colonies, addressed a proposal to the governor of British Guiana, along with those of other British Atlantic colonies, in March 1945, for consideration of the advantages of political federation. A federation of the sort he proposed might ultimately attain a status of self-government comparable with that of a dominion and, in the meantime. it would probably result in an increase of efficiency and economic stability and in lessened administrative costs. The adoption of a new parliamentary Colonial Development and Welfare act, which took effect April 25, 1945, resulted in increasing the sums available from the imperial treasury for grants and loans in the Caribbean area by more than 100%. A further evidence of at-

British Guiana: Statistical Data

tention from the mother country and of a trend toward unification was seen in the creation in 1945 of a department of civil aviation to serve all British West Indian colonies.

Representatives from British Guiana participated in a conference which met in the U.S. Virgin Islands, beginning Feb. 21, 1946, and included representatives of the various British, U.S., Dutch and French colonies and possessions in tropical America.

A disastrous fire on Feb. 23, 1945, in the business section of Georgetown resulted in damage estimated at \$10,000,000 and destroyed many of the important industrial properties as well as the well-known museum of the Royal Agricultural and Commercial society, containing rare specimens of wildlife.

British Honduras

British crown colony on the Caribbean side of Central America, British Honduras is bounded on the north by Yucatan (Mexico), on the west by Guatemala, and on the east and south by the Caribbean sea. The colony was formerly known as Belize (or Balize) and is called Belice by the Spanish-speaking neighbour states in Central America. Area (including about 212 sq.mi. of cays), 8,598 sq.mi.; the area in 1946 was still technically in doubt because of the existence of a claim by Guatemala to a large fraction of southern British Honduras. Pop. (1931 census), 51,347; later pop. estimates were as follows: (1938) 57,767; (1939) 58,759; (1940) 57,061; (1941) 61,068; (1942) 61,723; (1943) 62,512; (1944) 63,390. The capital and principal port is Belize (or Belice); its population by the 1931 census was 16,687; (1941) 17,289 and by a 1945 est., 18,188. Other towns include Stann Creek (2,844); Corozal (2,197); El Cayo (1,260); Benque Viejo (1,500). The population was estimated by one source to be increasing at the rate of about 800 a year. The annual birth and death rates in 1944 were 32.6 and 18.2, respectively, per 1,000. Purebred white inhabitants numbered less than 4%; the remainder were of mixed descent, and the large majority hybrids of Negro slaves, native Indians and white settlers.

The principal races of British Honduras,-in their order of predominance, are the Negro, Maya-Indian, Spanish-American, Carib-Indian, Scotch and English. English is the commercial and official language for the whole colony but Spanish is generally understood and is often spoken in the north and west.

Executive power was vested in a royally appointed governor, assisted by an executive council of seven members (including three officials and four nominated nonofficials), and a legislative council with a membership of 14 (six officials and eight nonofficials, six of the latter being elective). Governors: Sir Alan C. Maxwell Burns (1937–41); Sir John Adams Hunter (1942–46).

The frontier between British Honduras and Guatemala had long been regarded as definitively settled under a treaty made between the latter country and Great Britain in 1859, but in 1939 Guatemala reopened the entire question on the ground that Britain's noncompliance with the provision that it construct a means of transportation through British Honduras to the Guatemalan capital had invalidated the entire treaty. As defined in 1859, the boundary followed the Sarstoon (Sarstun) river from the Bay of Honduras to Gracias à Dios falls, ran northward in a straight line to Garbutt's falls on the Belize river, and from there due north to the Mexican frontier, which followed Blue creek and the Río Hondo to its mouth in Chetumal bay. The Guatemalan claim involved approximately two-fifths of British Honduran territory. In the second foreign ministers' conference, at Havana, Cuba, in July 1940, where the principal question for discussion was that of the attitude of the republics of the hemisphere toward the European colonies in the new world in the event that an attempted change of sovereignty and control over them should be made (by nazi Germany), Guatemala made a reservation with regard to British Honduras in agreeing to the proposed regime of provisional administration which the conferees suggested should be set up under certain contingencies. However, Guatemala in 1941 announced that, for the duration of World War II, it would not press its claim to the portion of British Honduran territory. The controversy was partially reopened when the Guatemalan government announced on May 3, 1944, that it would expect the U.S. to use its good offices to bring about a settlement of the matter. Following the Guatemalan revolution of Oct. 20, 1944, it was said that the new governmental junta in that republic planned to revive in active form its claim to a portion of the territory of British Honduras. Further diplomatic correspondence over the issue took place in 1945, and the government of Great Britain on Jan. 14, 1946, offered to submit the dispute over British Honduras to the international court to be organized under the United Nations. Guatemala on Jan. 16 agreed to this proposal.

Arrangements were made early in 1940 for the settlement of 80 European refugee industrial families at Ericatown in the west central highlands. They were expected to engage in specialized handiwork. At later stages in World War II, attention was directed to British Honduras as a possible location for large-scale refugee settlement, but nothing tangible developed from such proposals. Consequences of the war were felt from a relatively early date, especially in the form of economic dislocation, but the cumulative effects became especially serious by 1941. The direct effect of war disruption of colonial trade resulted in considerable unemployment and consequent economic depression. These factors were intensified by a hurricane in Nov. 1941 which destroyed an estimated 45% of the unpicked citrus crop. Efforts were directed by the colonial government in the meantime toward increased production of foodstuffs, especially rice, corn and beans, with the object of reducing the need for importations, which had been seriously curtailed by the reduced shipping available. The export market for fruits, an important though not the principal item in the colony's whole export trade pattern, was almost entirely lost by 1942 except for dehydrated fruits and other concentrated forms. Rubber development was stimulated during the same year, however, with a U.S. Rubber Reserve company contract to purchase all British Honduran production until the end of 1946. Later de-

velopments in the rubber industry in that colony made its future appear precarious, especially as it had been conducted on a somewhat artificial basis.

The already critical economic situation of British Honduras was further disturbed in 1942 by the added shipping disruption caused by the serious submarine menace, which brought the war to the colony's doorstep. In June of that year, 15 persons were arrested as axis agents charged with furnishing axis submarines with information and supplies. The leader of this group, which had close liaison with a spy ring in Panamá, was identified by police as a resident of British Honduras. It was alleged that coastal ships had been used to supply submarines with petroleum during night-time rendezvous and that clandestine radio transmitters operating from British Honduras had sent information on shipping movements to lurking submarines.

The shipping shortage continued to seriously affect British Honduras in 1943. The foresighted policy of licensing imports, begun by the colonial government in 1941, had cushioned the effects by enabling the government to bring about the importation of a stock of essential commodities, with the result that British Honduras was better supplied than most British Caribbean colonies well through 1942. The cost of living steadily increased in 1943, however, and rationing of rice, a staple article in the diet of the poorer classes, proved necessary. Limits on profits were also imposed by the colonial government. Some shortage of labour occurred in the colony during the year, chiefly because more than 3,000 workers were recruited for employment in the Panama Canal Zone on wartime construction projects being undertaken there; an additional 600 workers were taken into United Kingdom services of various sorts.

The colony was concerned in 1945 primarily with problems of economic rehabilitation following the end of World War II. After the end of fighting in Europe the shipping shortage was eased, and hope was expressed in government circles that such facilities would be restored to near normal by 1946. Minor excitement was caused by a warning given July 19, 1945, that German residents in the colony would join with Germans in the department of Alta Verapaz in Guatemala to create a dangerous situation. The author of the report, one Ramón Blanco, appeared later to have spoken without foundation.

British Honduras was concerned in the closing stages of the war with consideration of the possibility of closer political and economic co-operation with other British colonies in tropical America, perhaps ultimately leading to a form of political federation. Although the colony remained nominally independent of all other near-by British colonies, it tended to assume a closer relationship with them during the decade. From 1940 on, British Honduras, along with the six British colonies in the West Indies and with British Guiana, was served by a common comptroller for development and welfare, together with expert advisers in special fields; this development was provided for by the Colonial Development and Welfare act, passed by the British parliament in July 1940. The act in turn was an outgrowth of the exhaustive survey made in 1938-39 by the West Indies royal commission, headed by Lord Moyne and commonly known as the Moyne commission, which was created to examine economic and social conditions in the eight British colonies in the area, and to make recommendations. The commission's report, partially published in Feb. 1940, proposed the creation of a West Indies welfare fund with a liberal parliamentary grant.

Problems of labour relations, acute in British Honduras as well as elsewhere, were emphasized, and the commission made comprehensive proposals dealing with them. Political problems recognized by the commission included the long agitation for a greater degree of self-government and a reduction in the qualifications required for election to membership on the various legislative councils. The ultimate objective of complete political federation, the commission felt, should be approached slowly, although Oliver Stanley, minister for the colonies, addressed a communication in March 1945 to the governor of British Honduras, along with the governors of the other British colonies concerned, urging early consideration of the advantages of political federation.

The Moyne commission's report served as the basis for the parliamentary act of 1940, which in large measure regulated financial relations between the colony and the mother country until it was superseded by a new Colonial Development and Welfare act. The latter act, which took effect April 25, 1945, provided for considerably more generous grants for subsidy and loan to British Honduras and the other Caribbean colonies. Representatives of British Honduras were also engaged in the latter stages of the war in discussion with those of other British colonies in the general area of such common problems as the establishment of a common currency on a decimal basis, a customs union, uniform quarantine regulations, etc. Two delegates from the colony attended the meeting of the West Indian conference, which held its initial meeting at Bridgetown, capital of Barbados, from March 21 to March 30, 1944. The Bridgetown conference discussed a wide range of economic measures conditioning postwar rehabilitation, including increase of local food production and the rais-

ing of the standard of living in the various colonies, the postwar absorption of veterans and war workers, longrange public-works programs and other matters. The conference recommended the furthering of secondary industries to satisfy local needs, where they might prove feasible and proposed economic surveys and the development of transportation and resources for British Honduras and certain other areas. The Anglo-American Caribbean commission, established by joint action of Great Britain and the U.S. on March 9, 1942, assumed a measure of jurisdiction over British Honduras, insofar as its responsibility for research and recommendation went; the further integration of British Honduras with the other colonial possessions in tropical America appeared likely with the expansion of the work and organization of the A.A.C.C. in 1945 to include representatives of the Netherlands and France with regard to their Caribbean possessions. All four colonial powers, including representatives of British Honduras, participated in a joint conference held in the U.S. Virgin Islands, beginning Feb. 21, 1946.

Domestic constitutional changes also took place in British Honduras in the latter part of the decade. Members of the Belize municipal council were elected by popular vote for the first time in Dec. 1944. This was a step in the direction of a long-agitated increase in the degree of elective representation. A further step came in 1945, when the legislative council began consideration of a new draft constitution designed, among other changes, to increase its elective membership. British Legion

The British legion was founded in July 1921 by Field Marshal Earl Haig, who succeeded in uniting into one body a number of ex-servicemen's organizations which had come into existence during the latter part of World War I. The chief objects of these associations had been to secure the statutory right to pensions of those disabled in war service, to see that the pensions were adequate, that proper provision was made for the dependents of the fallen and of the disabled, and that all possible assistance was given in the resettlement of ex-servicemen and women. These continued to be objects of the new united organization, and to them Lord Haig added the preservation of the spirit of comradeship and service, engendered in war, for the benefit of the nation in peace. The legion was organized in areas covering the whole of England, Wales and north and south Ireland. In Scotland the legion was made an independent body, closely affiliated to the British legion. In each area there county councils were established, and in the case of the large towns, district councils, and under these came the branches. Every man and woman who had served in the forces became eligible for election to membership of a branch, and every member of a branch was given an equal vote, whatever his rank may have been in war. Branches, districts, counties and areas continued to hold annual conferences at which the officers for the coming year were elected and recommendations made as to future policy. The governing body of the British legion remained the national executive council. Two representatives of each area were elected annually at the area conferences to represent the area on the council. Each Whitsuntide, annual conferences continued to be held, to which every branch was entitled to send a delegate and to submit resolutions for consideration. At the annual conference the nominations of areas to the national executive council were confirmed, the officers of the legion elected, the work of the council reviewed, and the policy of the legion determined.

The officers of the legion were the president, the chairman and vice-chairman of the national executive council, and the treasurer. The business administration was directed by a general secretary. Under the constitution, chairmen who had held office for three years became ex officio members of the council. In 1946 there were five such ex officio members.

Simultaneously with the formation of the legion, a women's section was established, the female relatives of those who had served being eligible for membership. The objects of the section were to assist the work of the legion in every possible way and in particular to care for orphan children and the widows of the fallen.

In 1946, the number of branches of the legion was 4,700, and the number of branches of the women's section 2,600. Each branch decided the rate of subscription for its members, but for every member an affiliation fee of one shilling and six pence was paid to headquarters, of which one shilling was retained to meet the cost of general administration and six pence was returned to areas for their administration. The benevolent work of the legion was still mainly financed by Poppy day, an annual collection made on or about Nov. 11, the date of the armistice of 1918.

For the first Poppy day in 1921 the poppies were made in France and brought to England. The number proved to be quite insufficient to meet the demand. Major Howson then established a factory for the making of poppies by disabled ex-servicemen, and this was taken over by the legion in 1925. In 1946, about 400 disabled men were employed in the manufacture of some 45,000,000 poppies. This annual collection steadily increased its hold on the public. The first Poppy day produced just over £100,000, that of 1945 just over £1,000,000. The spending of this money continued to be supervised in part by some 4,000 service committees of voluntary workers dealing mainly with cases in which help to individuals was needed, and in part by headquarters, which established national organizations for the benefit of ex-servicemen. These included a large sanatorium for ex-servicemen at Preston hall, near Maidstone, Kent, with a convalescent home at Bournemouth; another sanatorium for ex-servicewomen at Nayland, Suffolk; the Poppy factory; a factory for the manufacture of Welsh tweeds by disabled men in Wales; the provision of rooms especially rented for disabled men; a pension fund for the prematurely aged; and an organization for the sale of goods made by disabled men in their own homes. The legion also financially assisted other organizations for the disabled, particularly St. Dunstan's, for blinded servicemen. To this it continued to make an annual grant of £50,000 a year. Besides this the legion had, by constant pressure on successive governments, radically improved the pensions of the disabled and worked consist-

ently for preference in employment for those who had served in war, while its members remained active in promoting and aiding the civic life of the communities in which they lived and worked.

British Museum

The years from 1937 to 1946 were all war years in the history of this world-famous museum in London, England. Those before 1939 were largely occupied with general preparations for protecting the collections in the event of war; from Aug. 1939 until May 1945 the administration was actively engaged in putting into practice these principles of safety; and the last years saw the beginning of the slow process of postwar recovery.

The two institutions administered together at Bloomsbury, London-the unique national library and the national museum—continued to serve different public uses. The library is primarily a service supplying current literature for immediate use; the museum is mainly an instrument of historical and artistic education. It was therefore possible to withdraw the whole of the museum material and to place it in protected storage, but the library served vital wartime needs, and its public service was maintained without other interruption than a few brief closures for adjustments after damage. The protective methods adopted were evacuation to safe localities of portable material and storage of the rest, consisting mostly of heavy sculpture, in blast- and splinter-proof shelters on the ground floors of the museum. These measures were so effective that no evacuated or protected object was lost or damaged. The books, which were necessarily exposed to air attacks, were not so fortunate. One bookstack containing some 200,-000 volumes was burned out, and 40,000 volumes of newspapers were destroyed. The repositories first chosen for evacuation were the national library of Wales at Aberystwyth and some country houses in the midlands and the north of England, lent by their owners for that purpose. An unused tunnel of the London underground railways was also prepared by the ministry of works for the reception of some materials. All the manuscripts, prints and drawings, and large numbers of antiquarian books were evacuated. Preparation had been so complete that the material of first importance was removed from the museum in the week before the war began. It soon became evident that the localities which had been considered safe from air attack were not so, and the government was asked by the museum to provide large bomb-proof storage for the collections dangerously placed in country houses. This urgent need was met by the ministry of works with the conversion of a worked-out stone quarry under go ft. of rock into an air-conditioned repository.

The members of the staff who were not serving in the library, with the armed forces or in government departments were employed in day and night watch of the museum buildings and the various repositories. But beside its disabilities, the wartime stoppage brought an opportunity of viewing in isolation some problems of administration which had long been insistent. Plans were prepared for

future improvements in accommodation to be co-ordinated with the repair of war damage. In particular, provision was made for the inevitable growth and adequate service of the national library.

Many of the upper exhibition galleries were destroyed by fire, and major building operations could not even be begun by the end of 1946. Minor repairs, consisting mainly of replacing blasted windows and roof-lights (more than 50 rooms and galleries were so damaged), could hardly be completed in that time. The library services were fully restored, but only a small part of the museum was reopened to public use. There again the opportunity was offered of turning wartime disabilities to advantage. Evacuation had provided empty galleries, and the largest and most modern of them was prepared for the display of representative material from the departments of antiquities and ethnography. This comprehensive exhibition in a single gallery of the most significant documents of history and art satisfied a public need which had long been recognized, but which normally would have been forced to await the provision of a new building. As a permanent feature of a large museum it was an important and successful innovation.

Some of the most valuable acquisitions in the history of the museum were made in these ten years by gift, bequest or purchase. The trustees' parliamentary grants for this purpose were largely withdrawn during the war, but generous aid was given by the Friends of the National Libraries and the National Art-Collections fund. Outstanding additions to printed books and manuscripts were the Ashley library of fine editions of English authors (bought 1937), the Paul Hirsch music library (bought for £120,000 in 1946), the Lacock Abbey Magna Carta (given by Miss M. E. Talbot, 1945), 47 mediaeval MSS from the Henry Yates Thompson collection (given by Mrs. Yates Thompson, 1941), the Bohun psalter and book of hours (bought 1943). Sporting prints and drawings from the Schwerdt collection were bought in 1939, and Colonel C. W. Cruickshank gave his collection of military prints in 1944. A complete collection of British South African postage stamps was given in 1944 by Mrs. Cunningham, daughter of the collector, E. Mosely, and the great collection of Greek coins formed by Dr. A. H. and Miss M. Lloyd was given in their memory by Mrs. Lloyd in 1946. Important Egyptian antiquities were bequeathed by Sir Robert Mond in 1939, and Egyptian and Oriental works of art by Oscar Raphael in 1942. A large part of the Cranmore ethnographical collection of H. G. Beasley was given in 1941 by Mrs. Beasley. The Southesk collection of Babylonian and oriental cylinder-seals and the Hellenistic Portland vase were bought in 1945. A large hoard of Roman silver plate found at Mildenhall in Suffolk was acquired as treasure trove in 1946, and the rich gold and silver treasure and other furniture of a 7th century royal Anglian ship-burial at Sutton Hoo in Suffolk was given by Mrs. E. M. Pretty in 1939.

British South African Protectorates

The three protectorates-Bechuanaland, Swaziland and Basutoland-owed their origin to the century-old difference of opinion about the rights and the position of African natives as shown in British policy on the one hand and South African, particularly Boer, policy on the other. With the increasingly restrictive legislation of the Union of South Africa, which excluded natives from attaining, for the time being, a status of equality with the white man, the difference between union territory and the protectorates became all the more pronounced, Britain being pledged to safeguarding above everything else the interests of the natives. The three districts did not become protectorates in the true sense of the word since there was no clear-cut difference between external relations (to be cared for by the protecting power) and the internal affairs (to be administered irrespective of the latter); they were better described as British colonies which had been placed, for convenience's sake, under the dominions office-so as to smooth the constant contact with the Union of South Africa-and which aimed at the establishment of indirect rule through native tribal authority under the guidance of three resident commissioners under a single high commissioner, the latter having his seat in union territory, at Pretoria, while the three resident commissioners worked at Mafeking (for Bechuana), Mbabane (in Swazi) and Maseru (in Basuto).

Bechuanaland, never surveyed as a whole, covers some 275,000 sq.mi. of tropical Africa bordering on the Union of South Africa in the east and south, on the union mandate of South-West Africa in the west and on Southern Rhodesia in the north east. Population, according to the 1936 census (figures for 1921 in parentheses): natives 260,064 (150,185); other coloured 3,793 (1,055); Europeans 1,899 (1,743).

Swaziland (cap. Mbabane) covers 6,704 sq.mi. bordering in the east on Portuguese Mozambique as well as on the Union of South Africa, which also constitutes its neighbour in all other directions. Population, according to the 1936 census (figures for 1921 in parentheses): natives 153,270 (110,295); other coloured 705 (451); Europeans 2,740 (2,205).

Basutoland (cap. Maseru) covers 11,716 sq.mi. and is wholly surrounded by union territory; it is 5,000–11,000 ft. above sea level. Population (1936 census) (figures for 1921 in parentheses): natives 559,273 (543,078); other coloured 1,604 (1,241); Europeans 1,434 (1,603).

High commissioners during the decade 1937–46: Sir William Clark (Jan. 1935–July 1939); Sir Edward Harding (July 1939–Feb. 1941); Lord Harlech (Feb. 1941–Oct 1944); Sir Evelyn Baring (after Oct. 1944).

Bechuanaland, well described as a marginal ranching country, continued to suffer from unreliable rainfalls which -quite apart from the Kalahari desert-made agriculture precarious. Only the Bakgatla tribe, less so the Bangwaketsi and Bamalete, could be said to be fairly well housed: they lived in townlike settlements. With no sanitation and only 14 qualified doctors for the whole population (total number of hospital beds, including European, was 183 in 1940; in-patients treated were 2,890) progress was slow, even if the increase in population figures was continuing at a gratifying rate. There was reason to believe that good underground waters exist; hence the great importance attached to the grant of £25,000 made by Great Britain in 1944 for a water survey. Another £27,500 was granted for increased educational facilities; there were 131 schools with 15,390 pupils, an unsatisfactory number since

the majority of the young boys spend most of their time with the cattle beyond the reach of schooling. Some 10,ooo men, moreover, regularly worked abroad. The British district officers, mostly recruited from the police, had little influence since the tribal chiefs, as in pre-British days, claimed absolute power, could call on tribal labour and had the right of tax collection. In 1938, native treasuries were established (native tax stood at $f_{1.10s.od.}$, including a contribution to the native fund for educational advance). While the elected European advisory council met twice yearly, the native advisory council, established in 1922, was nominated, met once a year and proved quite ineffective as a true expression of tribal wishes. While the natives relied chiefly on their cattle, the Tati district, with 18 producing mines, witnessed an increase in European-owned gold production.

Swaziland, two-thirds of which had been given to some 500 European concessionaires, had almost been lost to the native population when the British took over in 1906. In 1946, land was still being re-bought to settle landless natives, the last of these schemes providing some 364,609 ac. (229,160 of which were regained from European owners, mostly absentee landlords) which were paid for with the help of a special grant of $f_{160,000}$ made by the Colonial Development fund. Another grant, of £37,500, made in 1941, was used for a geological survey. Unlike Bechuanaland, with its south to north railway line from the Union of South Africa to the Rhodesias and beyond, Swaziland had no railway approach except by road to the railheads in Mozambique or union territory. A speedy increase in educational facilities was being provided (there were 278 schools with some 9,000 pupils during the decade) since a school grant of £130,000, terminating in 1947, was made by the British government. Some 10,000-15,000 young men regularly worked abroad and were thus withdrawn from tribal life during a most important part of their life. Native tax went up to £4.10s.0d., according to the number of wives; as their main occupation was cattle rearing, and as the union had banned cattle imports, at the rate of taxation the economic need for continued work in the mines across the borders remained. While there was a native advisory council of the so-called "Induna" meeting at times under the paramount chief, power rested mainly in the latter's hands. Asbestos manufacture began in Swaziland after World War I, reaching in 1941 the value of £500,000.

Basutoland, the South African "Switzerland," remained the only one of the three districts totally surrounded by territory of the South African union; yet it was by far the most advanced and most independent minded: The whole of Basutoland continued in native hands, thanks to the protecting power which refused to alienate any of it; neither was there any crown land. With the rapid increase in population, however, land became scarce, even high mountain valleys being grazed and used; soil erosion moreover played havoc: tree-planting, begun in earnest in 1942, was completing the drive against this serious danger, which was first met by a special grant of $f_{160,000}$, given by the British government in 1937, for the construction of terraces and dams and the sowing of thatching grass and lucerne; at least 15,000,000 trees had been planted in village woods. Otherwise the land was well suited for agriculture. Wool, classed from 1937, was proving a steady source of income. Of the cattle none could be exported for slaughter owing to South African restrictions (in 1920 cattle export had brought more than £100,000). "The water,"

said the official Annual Report for 1938 "is invariably infested from surface pollution"; yet there were, in 1940, only 324 hospital beds available (medical staff was 11, in-patients numbering 5,139). A costly leper settlement, requiring some £20,000 a year, maintained some 700 inmates. There were over 800 schools by 1944 with some 85,000 pupils, a figure which would be raised only if the habit of cattle grazing on unfenced landwith the need for constant attendance by the young boys of the tribes-could be altered.

Adult education too appeared to be extremely difficult through the absence of over half the male population working mainly in the mines of the Witwatersrand.

These men were not only missed by their tribe during their best years—even if they sent some money and parcels home and enabled the tax demand to be fulfilled—but also they not infrequently constituted a real danger to tribal life (according to Sir Alan Pim's report, a large proportion of the Johannesburg native prostitutes were Basuto).

No mineral development had so far taken place in the territory, but a preliminary geological survey had been carried out from 1938. Bridle paths too had been renewed after that year. The native council (*Pitso*) of 94 natives chosen by the paramount chief and 5 nominated by the resident commissioner had not yet acquired representative character.

As from April 1, 1946, native treasuries, similar to those of Bechuanaland, were introduced in accordance with Sir Arden Clarke's scheme.

This involved the introduction of salaries for all chiefs, who became responsible for tax collection, and a reduction of the number of native courts from 1,340 to 117 (fines were a source of income for the chiefs, an undesirable feature now abolished). Chiefs now held two warrants, one as administrators and one as judges, either of which they might lose if abused. Native tax stood at £1.5s. rising to £3.15s. according to the number of wives.

Part of the income of all three protectorates derived from the Johannesburg agency, strengthened in 1938, to collect there and then tax from the protectorate workers who had been recruited for work in the mines; another part took the form of a percentage contribution from the customs income of the union with which the districts had been forced to live in a customs union, thus having to follow the tariff policy of the Union of South Africa irrespective of their own needs.

In July 1939 the chief of the Basutos died; he was followed by Seeiso Griffiths, whose sudden death in Dec. 1940 led to the regency of Chieftainess Mantsebo. Of the Bechuana chiefs, Tshekedi was by far the most remarkable. During World War II the chiefs went out of their way to support the British government, making repeated voluntary contributions through special war levies: 19,000 Basuto, 3,800 Swazi and 9,500 men from Bechuanaland served in the African pioneer corps through all the African and middle east campaigns; another 2,500 men from the 3 protectorates entered the native military corps of the union.

Externally, their main preoccupation remained the fear of losing their fundamental rights, enjoyed under British protection, and of being reduced, through forcible transfer, to the status of the natives in the Union of South Africa. In 1937 discussions between the then prime minister of the union, General J. B. M. Hertzog, and the dominions secretary, Malcolm MacDonald, led to the establishment of a standing joint advisory conference (consisting of the three resident commissioners on the one hand, the union secretary for native affairs and two advisers on the other.) By the end of 1946, the memorandum on the future of the protectorates, drawn up by this conference and sent to the British government, had not so far been published. During World War II the question remained in abeyance. In March 1944, however, Field Marshal Jan C. Smuts complained about these "little territories" which, he said, were "sandwiched" in between union territory. Before leaving for San Francisco, when he repudiated the idea of annexations generally, he declared: "The destination of these territories is that they will become South African territory." In the British view, this could happen only if and when the natives, to the propagation of whose interests they stood pledged, would be secured a brighter future within such a framework than without. (See also British EMPIRE; SOUTH AFRICA, THE UNION OF.)

British-U.S. War Boards

Combined Production and Resources Board.—The Combined Production and Resources board was created by President Franklin D. Roosevelt and Prime Minister Winston Churchill on June 9, 1942, to complete the or-

ganization needed for the most effective use of the combined resources of the United States and the United Kingdom for the prosecution of World War II. On Nov. 10, 1942, the board was expanded to include a Canadian member.

It was the function of the board to co-ordinate the war effort of the member countries, and as appropriate, of other United Nations, in the production, allocation and supply of those products (other than raw materials and foodstuffs) which required combined planning in order to meet military and essential civilian requirements. It was also charged with responsibility for determining availability and sources of supply for finished products (other than raw materials and food) required to meet the needs of liberated areas.

The three member governments officially terminated the board on Dec. 31, 1945. Prior to that time most of the board's commodity committees had been dissolved following the termination of hostilities, but because of the continued critical situation in respect to coal and textiles it was decided that the two committees handling these products should continue on an independent international basis. In so continuing their functions in 1946, the committees retained the names "Combined Textile committee" and "Combined Coal committee," under which they had operated when a part of the Combined Production and Resources board.

During the life of the board, members representing the U.S. were Donald M. Nelson and J. A. Krug, successively chairmen of the War Production board; member for the United Kingdom was Oliver Lyttelton, minister of production; and member for Canada was C. D. Howe, minister of munitions and supply. Deputy members were, for the U.S., James S. Knowlson, C. E. Wilson, W. L. Batt and F. M. Eaton; for the U.K., Sir Robert Sinclair and Sir Henry Self; for Canada, E. P. Taylor and G. C. Bateman.

Combined Raw Materials Board.—The Combined Raw Materials board was established on Jan. 26, 1942, to plan and co-ordinate the raw materials programs of the two countries and to collaborate with the other United Nations to secure the most effective utilization of all faw material resources at their disposal.

The activities of the board included analysis of the supply and requirements position of the United Nations for the major critical and essential raw materials; allocation of supplies of scarce raw materials among the United Nations when necessary; and working out agreements to expand supplies, to conserve the use of raw materials in short supply, and to co-ordinate the purchasing activities of the U.S. and Great Britain in foreign raw material markets.

William L. Batt was the U.S. member of this board throughout its entire existence; Sir Clive Ballieu was the U.K. member from Jan. 1942 until Sept. 1943; Sir Charles Hambro from Dec. 1943 to Nov. 1944; and Sir Henry Self, from Dec. 1944 through Dec. 1945. The U.S. secretariat and staff of the board were provided by the War Production board. The U.K. secretariat and staff were drawn from the British Raw Materials Mission, which represented the British Ministry of Supply in Washington, D.C.

The two governments terminated the board on Dec. 31, 1945, and in co-operation with other United Nations established three autonomous Combined Commodity committees with broader international representation, to continue the functions of the board with respect to allocations of tin metal; rubber; and hides, skins and leather.

It was agreed by all of the member governments that the Combined Commodity committees should continue in existence only during the emergency period of global short supply of these commodities. The agreed objectives of the committees were to obtain an equitable distribution of available supplies among the consuming countries of the world, to promote stabilization of the general level of prices; and to obtain the most effective possible use of materials in the postwar reconversion of the economies of the world to the production of peacetime goods and services.

Munitions Assignment Board (Washington).—This board's establishment was also announced Jan. 26, 1942. Working in close collaboration with the corresponding London organization, the board mantained full information of the entire munitions resources of Great Britain and the U.S. and translated such resources into terms of combat forces and their material reserves. The board was responsible for making assignments of stocks and production of finished war material to the U.S. and Great Britain and to others of the United Nations.

Members who served for the U.S. were Harry L. Hopkins, chairman; Adm. J. M. Reeves; Rear Adm. W. R. Purnell; Rear Adm. O. C. Badger; Rear Adm. L. D. McCormick; Rear Adm. V. R. Murphy; Rear Adm. E. W. Burrough; Gen. Brehon Somervell; Lt. Gen. B. M. Giles; Lt. Gen. I. C. Eaker; Maj. Gen. R. C. Moore; Maj. Gen. M. F. Harmon; Maj. Gen. R. L. Maxwell; Maj. Gen. G. E. Stratemyer; Brig. Gen. P. H. Tansey; Maj. Gen. J. H. Burns, executive; Maj. Gen. John Y. York, Jr., executive; Capt. W. S. Gubelmann, secretary; and Col. E. C. Kielkopf, secretary. Members who served for Great Britain were Adm. Sir Charles Little; Adm. Sir Percy Noble; Adm. Sir James Somerville; Vice-Adm. J. W. S. Dorling; Lt. Gen. Sir Colville Wemyss; Lt. Gen. G. N. Macready; Air Marshal D. C. Evill; Air Marshal Sir William L. Welsh; Air Marshal Douglas Colyer; Air Vice-Marshal R. P. Willock; Air Vice-Marshal W. F. MacNeece Foster; Capt. E. M. C. Abel-Smith; Maj. C. M. Berkeley, secretary; and Group Capt. T. E. H. Birley, secretary. The Munitions Assignments board (Washington, D.C.) was abolished after the cessation of hostilities in 1945.

Combined Shipping Adjustment Board.—Creation of the Combined Shipping Adjustment board, constituted by agreement between President Roosevelt and Prime Minister Churchill, was announced on Jan. 26, 1942. The purpose of the board was to "adjust and concert in one harmonious policy" the work of the U.S. and British shipping authorities in regard to shipping problems arising out of World War II.

The board established joint policies for the direction of vessels in the Allied shipping pool during the greater part of the war in order to obtain the maximum over-all economy in the use of available shipping facilities. The board consulted with other combined boards with a view to securing compression of total demands to within the total capacity of shipping, and through its forecasts of shipping availabilities contributed to the determination of shipping priorities and forward planning of military movements.

The Combined Shipping Adjustment board was made up of two boards, located in Washington and London. Admiral Emory S. Land, administrator of the War Shipping administration, and Sir Arthur Salter, head of the British Merchant Shipping mission in the U.S., initially composed the Washington board. Successors to their positions were Captain Granville Conway for the U.S.; John

S. Maclay, W. O. Hart and W. S. Graham for the U.K. Lord Leathers, minister of war transport, and W. Averell Harriman, the president's representative in London in matters of supply and shipping, composed the London board on its inception. Their successors were Alfred Barnes for the British, and Phillip D. Reed and Thomas Blaisdell, successive chiefs of the American Mission for Economic Affairs.

On the termination of the European phase of the world conflict, most of the Allied and neutral tonnage which had been under charter to the U.S. and U.K. was returned to the control of the countries owning the vessels, and the functions of the C.S.A.B., pertaining to programming and allocations, etc., passed over to the United Maritime authority. However, the C.S.A.B. continued in existence to deal with problems of an Anglo-American nature.

Combined Food Board.—Acting jointly, the president of the U.S. and the prime minister of Great Britain on June 9, 1942, authorized the creation of the Combined Food board to obtain a planned and expeditious utilization of the food resources of the United Nations. In Oct. 1943, Canadian Prime Minister MacKenzie King accepted membership on behalf of the government of Canada.

The board was established to investigate and formulate plans with regard to any question relating to supply, production, transportation, disposal, allocation, or distribution, in or to any part of the world, of foods, agricultural materials from which foods are derived and equipment and non-food materials ancillary to the production of such foods and agricultural materials.

Although the board was originally created for the purpose of assisting the United Nations in the conduct of World War II, it was decided after the end of hostilities that in view of the scarcity of many types of food, the board should continue to exercise its functions. Accordingly, it continued to operate until July 1, 1946, at which time it was dissolved by the president of the U.S. and the prime ministers of Great Britain and Canada, and its functions, documents and records were transferred to the International Emergency Food council.

During the life of the board, members who served for the U.S. were Marvin Jones, formerly administrator of the War Food administration and Clinton P. Anderson, secretary of agriculture; for the U.K., R. H. Brand, formerly head of the British Food mission and Maurice I. Hutton, head of the British Food mission; and for Canada, J. G. Gardiner, minister of agriculture. (See also Canadanan-U.S. War Committees.) (S. L. Pr.)

British West Africa

British West Africa consists of four territories, the Gambia, Sierra Leone, the Gold Coast, and Nigeria. Adjoining the two last and administered by them are the mandates of British Togoland and the British Cameroons. All border on the Atlantic and are widely separated from each other by great areas administered by France, and smaller ones under Portugal and Liberia. The Gambia is a narrow strip about the size of Wales lying on each side of the Gambia river; Sierra Leone, about the size of Eire, lies 500 mi. south of the Gambia and is separated from it by territories under France and Portugal; the Gold Coast, about the size of Britain, lies some 1,000 mi. east of Sierra Leone, from which it is separated by Liberia and the French Ivory Coast; Nigeria, about four times the size of Britain, lies east of the Gold Coast and is separated from it by the French mandate of Togoland and the French colony of Dahomey. St. Helena and Ascension islands are

British West Africa

also described under this heading. Certain essential statistics are given in the accompanying table.

All these territories are populated by a tough and vigorous people who developed their own system of agriculture, crafts and internal exchange. Internal exchange is organized through many great markets in which in the southern districts women carry on much of the retail trade. The people live close to the land, and questions of land tenure are of supreme importance. In Nigeria, towns of considerable size are centres for large agricultural districts and seats of government for African rulers. The people are of a great variety of types, and speak a multiplicity of languages which were unwritten until missionaries with African helpers transcribed many of them. In the coastal belt the predominant strain is Negro. In the interior, intermixture with Hamitic people tells of hundreds of years of migration and conquest from the north southwards. In northern Nigeria, Hausa and Fulani people conquered tribal inhabitants and set up great city states under Mohammedan rulers. The tribal peoples vary widely in culture and government; some are citizens of highly organized kingdoms under powerful rulers, others are in small groups of kin. They practise many tribal cults, common features of which are belief in good and evil spirits and ancestors active in the affairs of their descendants. They have a great variety of protective rituals and sacrifices. Tribal cults are tending to disintegrate; Christianity continued to spread during the decade 1937-46, and Islam also gained adherents. Governors: Gambia: Sir Wilfrid T. Southorn (1936-41); Hilary R. R. Blood (after Dec. 24, 1941). Sierra Leone: Sir Henry Monck-Mason Moore (1934-37); Sir Douglas J. Jardine (May 21, 1937-41); Sir Hubert C. Stevenson (after July 5, 1941). Gold Coast: Sir Arnold W. Hodson (1934-41); Sir Alan Burns (after Oct. 1, 1941). Nigeria: Sir Bernard H. Bourdillon (1935-43); Sir Arthur F. Richards (after Dec. 18, 1943). St. Helena: Sir Spencer Davis (1932-37); Henry Guy Pilling (Jan. 1938–41); Major William B. Gray (after March 18, 1941). Ascension: resident magistrate: L. S. Bartlett (1934-36); P. E. Bunker (1937-40); S. H. Cardwell (after 1941).

The decade 1937–46 marked the end of the isolation of these territories from the rest of the world. Rail communications running from coastal points were: Sierra Leone 331 mi., the Gold Coast 500 mi., Nigeria 1,900 mi. There was an extensive development of all-weather motor roads and of secondary roads in both the Gold Coast and Nigeria. Launches and steamers in internal waterways increased the volume and speed of river transport. The development of communications was accelerated by the war. The spectacular development of the period was in air transport. In 1939, one small plane crossed the continent each week from Khartoum to Lagos, and there was no direct air service between West Africa and Britain. During World War II, Accra became the air base for the trans-African air route to theatres of war. After the war there was a trans-African air service, a service of several planes a week from Britain to West Africa and also services to other parts of the continent and to America.

Newspapers had an increasing circulation as literacy

spread. During the years 1939–45 local broadcasting developed, and listening to short-wave broadcasts increased. Men who had served in the forces widened the horizons of villagers by letters and tales. West African journalists visited Britain during the war, and West African units marched in the victory parade in London and had the opportunity to see aspects of town and country life. These men formed their own opinions and passed them on.

With the fall of France, to the danger of invasion by sea was added the danger of invasion by land, from neighbouring French colonies. The declaration of the governor of Chad for Free France, followed by that of the other provinces of French Equatorial Africa, decreased this possibility. Numbers of West Africans volunteered for the services and won distinction in East and North Africa, in Ethiopia and Burma. The precedent was established of sending West Africans to train for commissions at Sandhurst. Funds raised by the people to aid the war were considerable.

Submarines and shortage of supplies in Europe cut down imports, and a movement to live in the country encouraged various local industries. The war increased demand for products of the mines, and in Nigeria, for the first time, mine labour was conscripted. Lack of transportation made shipment of agricultural products difficult, and the government had to buy up the cocoa crop and market it. Some had to be destroyed because of difficulties of transportation. From 1945 on, the government proposed to purchase the crop, fix prices for producers and take responsibility for marketing. The breakdown of isolation promoted an increase of political consciousness, and a determination not to be exploited by the west. The hold-up of the cocoa crop in 1937-38 by producers who refused to sell at prices set by European buyers, strikes and the growth of African trade unions illustrated this point.

Mining development was increasingly important, and the retention in these countries of a reasonable percentage of mining profits was a question brought to the fore in the years immediately preceding World War II. The imposing of income tax in the Gold Coast retained in that country an increased proportion of these profits. The "traders' frontier" was pushed farther and farther into the interior. Both the market for foreign goods and the export of raw materials increased, and this in spite of the fact that production of agricultural produce was almost entirely by African farmers with a primitive economy. The accompanying table shows the importance of this increase:

	(less bullion and cash)	Exports	Total Trade
Gold Coast 1900	£ 1,099,000	£ 864,000	£ 1,963,000
1937	12,306,555	15,949,533	28,256,088
Nigeria 1900	1 <i>,</i> 735,000	1,887,000	3,622,000
1937	14,623,674	19,242,197	33,865,871
Sierra Leone 1900	553,000	318,000	871,000
193 <i>7</i>	1,691,930	2,820,178	4,512,108
Gambia 1900	194,000	241,000	435,000
1937	705,165	665,000	1,370,165

The entering of Africa into the currents of world life marked a new era. Need of survey of the continent had been emphasized in 1929 by General J. C. Smuts, and in 1938 the first survey of the whole continent was published

by Lord Hailey (An African Survey) to be followed by a number of studies, anthropological, political, economic and social, in which West Africa had a goodly share. Government commissions and reports supplemented studies by unofficial bodies.

World War II emphasized the necessity of regional planning and development. Just before its outbreak, a West African governors' conference started. On June 8, 1942, Lord Swinton was appointed minister resident in West Africa with headquarters in the Gold Coast. With the end of the war, this office was terminated and the governors' conference was revived. The enlistment of the services of experts to advise the four territories was under way, the appointment of an income tax commissioner and an authority on town planning being cases in point. It was also recognized that planning which crossed political frontiers was necessary. Control and prevention of disease, soil conservation and communications were some of the spheres in which this was essential. There was increasing consultation with French West and French Equatorial Africa.

The need of developing research led to the setting up of a colonial research committee in Britain. Research was required in many fields, including social anthropology, linguistics, music, arts and crafts, land tenure, tropical agriculture, health and nutrition. Much of this research had to be on an international scale. The setting up of an institute of tropical agriculture for Africa was one relevant proposal.

Colonial Development and Welfare.—A radical change took place in the colonial policy of the British government during the decade in that it no longer expected that colonies should be financially self-sufficient. In 1940, a statement of policy on colonial development and welfare laid down that "the primary aim of colonial policy was to protect and advance the interests of the inhabitants of the colonies" and funds were voted from the British treasury for assistance in development and research. An increased grant was made in 1945 to run to 1956. Advisory and specialist committees were set up to study and approve plans submitted by the colonial governments and to award grants.

Recruitment and training of African and European staffs was essential. In British West Africa, all branches of the civil service, including the administrative, were open to Africans with the necessary qualifications. In the Gold Coast African district, officers were working with European colleagues. Government grants were available to Africans for training, and numbers were being sent to take courses in Britain, including African women as well as men.

The years 1937-46 were marked by progress in supervision of labour. This progress took two main forms: (1) the appointment of special whole-time staffs in the shape of separate labour departments, or of labour and industrial advisers, and (2) the enactment of protective legislation. In 1938, the post of labour adviser to the colonial office was created and a social service department was set up. In 1942, a colonial labour advisory committee was established. Colonial labour departments multiplied from 11 in 1937 to 33 in 1941. Each of the West African colonies had such a department. In 1942 the policy of appointing experienced trade union officials as labour officers was adopted and Sierra Leone, the Gold Coast and Nigeria each had men with this experience. Advice and help was given to the trade union movement in these colonies by these officials. The assistance and advice of the Trade Union congress and of the International Labour office was much appreciated.

It was recognized that true co-operation amounts to economic democracy and that a good co-operative society is a school for good citizens. In the period 1937–46, co-operatives were fostered by the West African governments. In Nigeria, 200 co-operative societies were doing an annual business of £100,000. Thrift and loan societies were increasing. In the Gold Coast, cocoa producers' co-operative societies represented the most important groups of co-operatives.

The British government was committed to the advancement of the colonies to self-government. A condition of this advancement was the growth of sufficient unity among peoples of different origins and cultures to make it possible for them to share in responsibility for the central administration. Progress was made in this direction in the Gold Coast and Nigeria. In the Gold Coast, a new constitution, put into effect in 1946, provided for an elected African majority on the legislative council. In Nigeria, a proposed new constitution provided for representatives of

Natives in Nigeria labouring at the construction of an air base in British West Africa in 1944

the northern and southern provinces in one council, a step towards a united Nigeria. Whether these changes were going far enough was a matter of opinion. Another condition of advance was the evolution of traditional African governments into local authorities in a larger political entity. This depended on the assimilation of political, economic and social conception from without and the evolution of traditional cultures from within. Both in a number of native authorities and in the development of municipal government there were signs of advance.

The history of the years 1937–46 showed that a condition of success for the political, economic and social developments was the spread of education. Christian missions were pioneers in education at all levels, including a university college in Sierra Leone. Christian missions and the African church were responsible for 80% of the educational institutions and were aided by government grants. The declared government policy was that education should not be divorced from religion. A Gold Coast education committee report for 1937–41 referred to the statement in a memorandum of 1925 that "native education must be based on religion" and proceeded: "We state our belief that the essential purpose of education is to open to the citizens of a country a life which is rooted to the unseen

and eternal realities, from which all the potentialities of the child will draw the means of growth. Spirit, mind and body are all alike the concern of education."

The principle had now been accepted that the provision of universal education was a government responsibility, and the governments of these territories drafted ten-year plans for advancement toward this goal. Extension of teacher training in West Africa and the granting of a number of government scholarships for training in Britain were steps being taken to increase the supply of teachers. Though the colonial development and welfare fund gave some assistance, a universal system of education depended on revenue available, and this was determined by economic development.

A commission on higher education in West Africa, which included Africans and Europeans in its membership, reported unanimously in 1945 for the provision of a university of West Africa, though members differed on whether it should be a unitary institution or consist of colleges in Sierra Leone, the Gold Coast and Nigeria. It was also recognized that an educational approach had to be made to the whole population in and out of school and that this was a matter of urgency. A report on mass education in African society went from the colonial office to the colonies which stated the objectives of mass education as: (1) the wide extension of schooling for children within a measurable time; (2) the spread of literacy among adults; (3) the planning of mass education of the community as a movement of the community itself; (4) the effective co-ordination of welfare plans and mass education plans. The Gold Coast appointed a mass education office and local experiments in mass education were in being in Nigeria and Sierra Leone.

The objectives of government for these territories were summed up in the report as follows: to secure (1) the improvement of the health and living conditions of the people; (2) the improvement of their well-being in the economic sphere; (3) the development of political institutions and political power until the day should arrive when the people could become effectively self-governing. It was pointed out that "wise and effective" education was necessary to achieve these ends.

St. Helena and Ascension Islands.—St. Helena, 1,200 mi. W. of the African mainland, and Ascension, 700 mi. to the N.W. of St. Helena, are rugged volcanic islands. St. Helena is a British crown colony. Ascension, until 1922, came under the admiralty; in that year it became a dependency of St. Helena. The population of St. Helena, 157 Europeans excepted, is of mixed race with a strong Malayan strain. The total population by 1941 census was 4,710. Outstanding events in St. Helena for the years 1937-46 were few. Efforts were made to combat malnutrition through instruction, and school meals. The curriculum of the schools was considered in view of the fact that the majority of the people would never leave the island, and that teaching of crafts and agriculture which would raise the standard of life there was important. Efforts were also being made to broaden and enrich the interests of the people. "But," said the education report for 1941, "the conservatism of mind shown by the older St. Helenians is one of the greatest obstacles to progress."

Almost all the inhabitants of Ascension Island in 1939 were officials or employees of the Cable and Telegraph company, which had a station there. In spite of the fact that the island had no running water, fertile farms which produced the only vegetables and milk the island had ever known, were developed 2,000 ft. above the sea. In contrast to the case of St. Helena, Ascension saw great

changes through the war, for the island became one of the landing places for the R.A.F. transport commands ocean ferry across the South Atlantic. Late in 1941, a U.S. reconnaissance party came there, and by March 1942 the main U.S. task force arrived. The engineers moved vast quantities of the lava rock by blasting, and carved the single runway along the track of the prevailing wind, through vast barriers of jagged rock. In June the runway was ready, and the first U.S. aircraft landed on that amazing, but effective strip running between looming crags. Flights to Ascension had to be made by night in order to land at the first light, because the wide-awake birds spend the night in flight, and live on the crags in thousands during the day; when disturbed they are a menace to aircraft. In 1942, 127 aircraft were dispatched by the South Atlantic route via Ascension; in 1943 the number had increased to 1,336. From Ascension the planes were flown about 1,400 mi. to the great air base at Accra and from there on to theatres of war. Ascension Island, before the war an isolated cable station, set in the wide expanse of the Atlantic, became during the war a vital link in the system of air transport, which in the postwar period connected Africa with the rest of the world.

British Women's Services, World War II

Women's Royal Naval Service.—Disbanded in 1919, the W.R.N.S. was revived by the admiralty in 1939. Members were at first employed in naval shore establishments in clerical and domestic work and as drivers, but the scope of the W.R.N.S. (or "Wrens") rapidly expanded and developed until at the peak of World War II, when the service numbered 75,000, there were more than 100 categories, some being extremely responsible. W.R.N.S. officers were employed as duty staff officers at operational stations during coastal operations and attacks; they were signal officers and controlled staffs of mixed naval and W.R.N.S. ratings; they boarded merchant ships and issued routing and other instructions to the ships' masters. W.R.N.S. ratings were employed as wireless telegraphists and radio mechanics and worked on the maintenance and repair of naval aircraft and of torpedoes, guns and other equipment; and they manned harbour craft. Both W.R.N.S. officers and ratings were employed on communications in the armed liners used as war transports, being at sea for as long as seven months at a time. The W.R.N.S. continued as a permanent service in the royal navy after the end of World War II. Superintendent J. M. Woollcombe was appointed director in succession to Dame Vera Laughton Mathews on Nov. 22, 1946. (V. L. M.)

Auxiliary Territorial Service.—The A.T.S. was formed on Sept. 9, 1938, on the authority of a royal warrant, as a

peacetime voluntary reserve of women available for employment in noncombatant duties with the British army. Under conditions of service all women between the ages of 181/2 and 43 were eligible for enrolment for a term of four years; in the event of an emergency all members undertook to give full-time service for the duration of the emergency. Members were enrolled and not enlisted; there was therefore no legal method of recalling them to duty. The maximum strength was limited in peacetime to 20,000, and the duties were confined to motor driving, clerical work, storekeeping, cooking and domestic tasks. The organization was built up on that of the territorial army, each A.T.S. company being affiliated to a unit of the territorial army and receiving instructions and supplies from the territorial association of the county in which it was raised.

At the outbreak of World War II the establishment of the service was immediately doubled; all existing units were called up for service and placed under the command of the local army commander, although unit discipline and administration remained in the hands of the A.T.S. officers, as it was to remain throughout the war. Pay was based on two-thirds of the pay of the soldier. In 1941, the size and scope of the service was very greatly increased, the establishment being raised to 210,000, and many new army trades and employments were undertaken by women. The increased importance of the service necessitated considerable changes in the original terms of enrolment and from July 1941 a limited form of the army act was made applicable to the A.T.S. In March 1942, the A.T.S. received the first draft of conscripted women, called up under the National Service (No. 2) act of Dec. 18, 1941; these recruits were subject to the same conditions as volunteers. By 1943, the A.T.S. expansion had reached its peak, a maximum strength of 216,000, with more than 100 different trades and employments being carried out by women. Members were employed overseas in all parts of the world and latterly with the British forces in Europe. The A.T.S. formedan integral part of the British army, and at the end of World War II it was decided to retain women as part of the regular army in peacetime. (M. J. C. T.)

Women's Transport Service.—The W.T.S. trained continuously after its formation in 1907, when it was known as the First Aid Nursing Yeomanry (F.A.N.Y.). In 1938 it supplied all personnel for the formation of the first ten driver companies, A.T.S., and continued to recruit on behalf of the motor companies, A.T.S., until Sept. 1, 1941. All such personnel became fully enrolled members of the A.T.S. The corps continued to exist as a separate organization under the direction of its own headquarters. It ran its own training centre and its members were employed in all theatres of war, in driving, in wireless telegraphy and coding and in welfare services, including southeast Asia command army welfare. Members undertook special missions and were parachuted into axis territory and several died in action or in concentration camps. (M. B. E.)

Women's Auxiliary Air Force.—The W.A.A.F. was formed shortly before World War II and numbered at the end of Aug. 1939 only 1,734 officers and airwomen, who were called up for duty on Aug. 29, 1939. Expansion took place rapidly until by the end of 4 years the service was 106 times its original strength, with officers held in 22 branches and airwomen in 82 different trades. The peak of the service was reached in 1943, and general release began with that of the men in June 1945.

The object of the W.A.A.F. was to effect where desirable

the substitution of women for men in certain branches and trades. With very few exceptions the ratio was one for one. In specified trades it was also necessary to limit substitution to a certain percentage for varying reasons. Personnel were required to reach the same proficiency as the men and attended the same or similar courses. It was early realized that to serve the royal air force successfully the W.A.A.F must form an integral part of it and be employed and administered as far as possible within the framework of the R.A.F. Although constituted by royal warrant, the W.A.A.F. was virtually a civilian organization until on April 5, 1941, under the Defense (Women's Forces) regulations, officers and airwomen were declared to be members of the armed forces and became subject to certain sections of the Air Force act.

During World War II, nearly 250,000 women served with the W.A.A.F. It played its part in every R.A.F. operation and served in overseas commands; it assisted several foreign governments who wished to train their nationals in the United Kingdom, and sent two senior officers to help the Royal Canadian air force to form the R.C.A.F. women's division. In Dec. 1946 Group-officer Felicity Hanbury was appointed director of the service on the retirement of Lady Welsh, who had held that office since Oct. 1943.

(R. E. Wh.)

Air Transport Auxiliary.—The first nine women pilots to enter the A.T.A. started ferrying light trainer types of aircraft on Jan. 1, 1940. During the next 5 years the number of women pilots increased to more than 150, and they flew all types of aircraft, including four-engined bombers, from factories to maintenance units and thence to R.A.F. squadrons; aircraft worn in service were flown back from squadrons to repair units. They worked on an equal footing with the men pilots and received the same pay. In the organization there were also women operations officers, flight engineers, motor transport drivers, ground engineers, nurses and other staff. Two out of the 15 ferry pools were staffed entirely by women. During World War II, 15 women in the A.T.A. lost their lives in flying accidents. All flying activity of the A.T.A. had ceased by Nov. 30, (P. M. G.)

Women's Land Army.—The W.L.A. was organized and in readiness before World War II. In England and Wales, where the organization came formally into being on June 1, 1939, the Land army worked as a section of the ministry of agriculture and fisheries; it had its own headquarters with sub-offices in the different counties. There were also voluntary county committees and very large numbers of local helpers who supervised the welfare of its members. The Scottish Land army came under the department of agriculture for Scotland.

From small beginnings the Land army grew rapidly and reached its peak strength in Aug. 1943, when there were nearly 77,000 girls at work in England and Wales and just under 10,000 in Scotland. At first their employment was mainly in those farm operations for which women are especially suited; e.g., milking and care of young stock.

The field of work gradually extended to cover almost every type of farm job, and at one stage some 30,000 Land army members were employed by war agricultural executive committees in land reclamation, tractor work, drainage operations, threshing and all kinds of field work, while nearly 6,000 were engaged in timber operations and forestry.

At the end of World War II, a release policy was introduced for those girls who wished to return to civilian life, but between 30,000–40,000 remained at work in England, Scotland and Wales. The organization was to be kept up

Upper right: Ward in a Women's Auxiliary Air Force hospital at an R.A.F. depot, where a W.A.A.F. is shown being cared for by an R.A.F. doctor

Right: British women of the Air Transport Auxiliary who ferried planes from aircraft plants to R.A.F. fields during World War II, replacing men pilots needed elsewhere

Lower right: British Wrens (Women's Royal Naval Service) on signal duty

as long as Britain pursued a policy of intensified food production. (I. M. M. J.)

Women's Voluntary Services.—The W.V.S. organization was inaugurated in May 1938 to recruit women for the air raid precautions services and to undertake work for civil defense. The machinery of the W.V.S. centres, with a membership of 1,125,000, followed the pattern of local government administration in Great Britain. Operational work was carried out with A.R.P. and civil defense services, and with municipal authorities covering emergency feeding, staffing of rest centres, report centres and incident inquiry points, billeting, rehoming, issue of clothing, etc. Much of the billeting and care of evacuees and refugees was carried out by W.V.S. Special work was done in evacuating children under five years old, and in war and day nurseries. Over 51,000 children under 5 were handled from W.V.S. headquarters alone. A volunteer car pool to provide cars in case of invasion, air raids and other emergencies, numbered 20,000 drivers, and a mileage of 60,000,000 mi. in 3 years. This developed into a peacetime hospital car service. Work parties dealt with emergency appeals for civilian and service requirement and for aid to liberated countries. The services welfare program included clubs, canteens, hostels, guides and hospitality schemes for members of the British and Allied forces; over 1,000 W.V.S. members worked in clubs overseas. National savings, conservation and preservation of food and textiles, the collection of books and salvage schemes were attended to by street and village units. As sole agents for the American Red Cross, the W.V.S. handled over £10,000,000 worth of supplies, in addition to gifts from organizations in the British empire, the United States and other countries. Children from liberated countries, repatriated families from the far east and others, were clothed and their welfare was looked after. There were W.V.S. counterparts in India and throughout the British empire. Close contact and interchange of information were fostered with organizations modelled on the W.V.S., in Holland, Denmark, France, the United States, the dominions and other countries.

In 1946, the W.V.S. continued to meet the requests of government departments or local authorities for the betterment of the community, through communal feeding, food advice, clothing exchanges, mothercraft hostels, rehabilitation and resettlement work and home helps, and by supplying special schemes for the care of children, old people and specific cases. Bromine

The use of bromine in the production of tetraethyl lead for gasoline treatment was responsible for a 20-fold increase in bromine output of the U.S. in the decade before 1937, after which production was as follows, in short tons.

193713,100	194029,633	194347,043
1938 16,662	194134,159	194451,056
193918,941	194232,940	194539,855

Increases after 1942 resulted from the increased gasoline consumption in military transport vehicles and in aeroplanes.

Formerly secured as a by-product from well brines produced for the recovery of salt and magnesium chloride, the bulk of the output later came from sea water, which contains only a small fraction of 1% of the element. Other sources are sea water bitterns, dry-lake salt deposit at Searles lake, Calif., and the water of the Dead sea.

Brooke, Sir Alan Francis

See Alanbrooke, 1st Viscount (Alan Francis Brooke).

Brooke, Sir Basil Stanlake

Sir Basil Brooke (1888-), British statesman, was born June 9, 1888, the heir to a baronetcy established in 1822, and a nephew of Field Marshal Alan Brooke. He was educated at Winchester and Sandhurst, entered the army and served throughout World War I, receiving the Military Cross. He was elected to the Northern Ireland parliament in 1929, became minister of agriculture and privy councillor in 1933, and succeeded John M. Andrews as prime minister of Northern Ireland on May 1, 1943. Well-known for his hostility to Irish Catholics, he announced soon after his appointment that Northern Ireland planned a program of closer co-operation with Great Britain in the war effort. In Jan. 1944 Sir Basil said Northern Ireland also would support an agreement with the U.S. and Great Britain for regulating postwar civil aviation, in the hope of increasing its commerce with the U.S. On the topic of Eire's demand for return of the Ulster counties, he stated (Nov. 15, 1945) that Northern Ireland was "uncompromisingly opposed" to its inclusion in an all-Ireland republic.

Brooke-Popham, Sir Robert

Sir Robert Brooke-Popham (1878–), British air force officer, was born Sept. 18, 1878, in Mendelsham, Suffolk. He was educated at Haileybury and Sandhurst, entering the army in 1898. In 1912 he helped establish the air battalion of the royal engineers, a "freak unit" that was the forerunner of the royal air force. During World War I, Sir Robert was one of the first British pilots to fly over the German lines and was frequently cited for bravery. After that war, he headed a number of important air commands, becoming air chief marshal in 1935 and inspector general of the R.A.F., 1935-36. He retired in 1937 to become governor general of Kenya, but returned to the R.A.F. as air chief marshal at the start of World War II. He was appointed commander in chief of British forces in the far east in Nov. 1940, but was removed from his command, Dec. 27, 1941, after the disastrous rout of British imperial troops in Malaya by the Japanese. He returned to retirement in 1942.

*Preliminary es	timate						

The widely variable price was the chief cause of this irregularity in production. Prices ranged from \$70.14 per ton to growers in 1937 to \$268.12 per ton in 1943. The latter high price led growers to expand acreage over 56%, which, with an increase of 19% in the yield, brought the unusual crop of 1944. Labour shortage was the restricting factor in 1945, together with an unfavourable planting season. The acreage harvested dropped to 36% below that of 1944 and 14% below the average.

Brown, Prentiss Marsh

Brown (1889—), U.S. attorney and government official, was born June 18, 1889, at St. Ignace, Mich. He received his A.B. degree at Albion college, Albion, Mich. (1911), and studied at the University of Illinois (1911–12). Admitted to the Michigan bar in 1914, Brown later became active in law, business and politics. He ran unsuccessfully as Democratic candidate for congress in 1924 and for the Michigan supreme court in 1928. Brown was elected to the house of representatives, however, in 1933, and in 1936 was appointed to the senate to fill the vacancy caused by the death of Sen. James Couzens. He was elected to the senate for the 1937–43 term.

While in the senate, Brown sponsored the important price control act of April 1942, and the price stabilization act of Oct. 1942. Upon his defeat for re-election, he accepted Pres. Roosevelt's invitation to succeed Leon Henderson as price administrator in Jan. 1943. Illness prevented him from actively guiding the OPA, however, and he resigned on Oct. 21, 1943.

Brownell, Herbert, Jr.

), U.S. politician, was born Feb. Brownell (1904-20, 1904, at Peru, Neb., the son of a science professor. Graduated from the school of law, Yale university (1927) with an LL.B. degree, he practised law in New York city, joined the Republican party and soon became active in politics. He was elected to the New York state assembly from the 10th district in 1932, serving in the assembly from 1933 to 1937. He left politics after completing his term as assemblyman, but returned to the "fray" in 1941, this time not as a candidate but as a manager. In 1942 he returned the favour to Thomas E. Dewey, who had helped elect him assemblyman, and became Dewey's campaign manager for governor in the 1942 elections. Dewey's election was in no small part attributed to Brownell's organization, which was conceded even by the opposition to have been excellently managed. In 1944, Dewey made him not only his presidential campaign manager but chairman of the Republican National committee as well. That Dewey lost to Roosevelt was ascribed by Brownell to the fact that no candidate had a chance to unseat the president with the war still in progress. He was retained as chairman in 1945, but on Feb. 24, 1946, announced his intention to resign. He was succeeded by B. Carroll Reece.

Bruno, Giuseppe

Cardinal Bruno (1876—), Italian prelate, was born at Lezzadio, province of Alessandria, Italy. Upon completing his theological and juridical studies in Rome, he was ordained in 1898. Appointed to the Commission for Codification of Canon Law, he served under Cardinal Enrico Gasparri. Msgr. Bruno was, in 1945, a member of the Commission for the Interpretation of the Code and had been a member of the congregation of the Council for 30 years. Nominated to the Sacred College of Cardinals on Dec. 23, 1945, he was the only one of the nominees of that year whose duties kept him in Rome regularly. The body of which he was secretary supervises church law and makes arrangements for councils and conferences of bishops. He was created cardinal on Feb. 18, 1946.

Brussels

At the beginning of the decade 1937-46, Brussels led a happy life as capital of a small but prosperous nation. The year 1938, however, reminded the people of political and geographical realities; they remembered 1914 and had no illusions about the future. On May 17, 1940, motorized German columns entered the Belgian capital. On June 2 Gen. Alexander Ernst von Falkenhausen took up residence in Brussels as German governor-general of Belgium and northern France, and also Gen. Eggert Reeder, as chief of the German military administration for Belgium. The latter soon came to the conclusion that the agglomeration of 19 separate communes usually referred to as greater Brussels would be more easily controlled by a single body of collaborators than by 19 patriotic burgomasters and their councils of aldermen (échevins). He suggested the creation of greater Brussels. This reform was at once opposed by the municipal councils as illegal; the argument was that Germany had no right to change the laws of Belgium. In order to crush this opposition Reeder ordered on April 11, 1941, the dissolution of all municipal councils. But opposition was voiced by the burgomasters, headed by Dr. Joseph van de Meulebroeck, burgomaster of the city proper. Reeder decided to dismiss this fierce successor and pupil of Adolphe de Max, burgomaster during World War I. On the day of his dismissal (June 30, 1941) Dr. van de Meulebroeck declared that he still was and should remain "the only legitimate burgomaster of Brussels." On Sept. 27, 1942, General Reeder and G. Romsée finally created greater Brussels with Jean Grauls, a Flemish nationalist, as burgomaster. According to an official estimate of Dec. 31, 1939, the total population of the arrondissement was 1,277,847, of the 19 communes 943,658 and of the city of Brussels 189,036. The city proper covered 12.7 sq.mi.

Brussels was liberated on Sept. 3, 1944, by the British and army. Five days later the legitimate Belgian government returned to its capital from London. One of its first acts was to annul all the German-promulgated legislation. The greater Brussels automatically ceased to exist. Dr. van de Meulebroeck was back in his hôtel de ville. (K. Sm.)

Bubonic Plague

Bucharest

Bucharest, capital of Rumania, lies in a valley of the Dimbovita river; it covers an area of some 20 sq.mi. and had an estimated population of 648,162 at the end of the decade (631,228 by the census of 1930).

The intrigue that characterized Rumanian politics for decades prior to 1940 had its source in the capital, Bucharest, whence it seeped through all classes of society. Both major political parties had maintained their sway by means of corrupt elections and coercive decrees. When in power they had censored the press and abolished several popular newspapers for too-frank editorials. They decreed anti-communist and anti-socialist laws, although these parties had never polled more than 2% of the votes. Labour, too, fared badly.

Cabinet succeeded cabinet, revolt led to revolt in the continual battle for personal power; and the country was ripe for the dictator's squeeze.

During World War II, Rumania was not devastated like many other European countries, although it became Germany's partner in defeat. Russian-incited riots and antifascist demonstrations flared in Bucharest, fed by workers and children who were forced to attend. After the Rumanian surrender to the Allies on Aug. 23, 1944 (in retaliation for which the Germans bombed Bucharest rather severely) the capital as well as the country became virtually a Russian province, taking orders from Russian Commissar of Foreign Affairs Andrei Vishinsky. Millions of dollars worth of reparations were siphoned into the soviet union. (See also Rumania.)

Buckner, Simon Bolivar, Jr.

Buckner (1886–1945), U.S. army officer, was born July 18, 1886, near Munfordville, Ky., son of the celebrated Confederate general, Simon Bolivar Buckner, who fought U.S. Grant at Fort Donelson and served under Braxton Bragg in the Chickamauga campaign. The younger Buckner also decided on a military career. After studying at the Virginia Military institute, he entered the U.S. military academy at West Point, graduating in 1908. He subsequently returned to West Point and was instructor there of military tactics (1919–23) and commandant of cadets (1932–36). During World War I, he commanded aviation training brigades.

In July 1940, more than a year before the U.S. entry into World War II, Gen. Buckner was made commander of the Alaska defense force. He played a prominent role in the recapture of the Aleutians from the Japanese in 1942–43. Awarded the D.S.M. in Oct. 1943, he was raised to the temporary rank of a lieutenant general. After the Aleutians campaign, he reported to the Central Pacific command and was named commander of the new U.S. 10th army. On April 1, 1945, this force invaded Okinawa. Three days before the end of the Okinawan campaign, Buckner was fatally wounded by an enemy artillery shell, June 18, 1945, while watching his troops in action from a forward observation post.

Buckwheat

For 50 years prior to World War I, U.S. buckwheat acreage was fairly stable, at about 800,000 ac. The crop varied with the seasons from 7,000,000 to 14,000,000 bu.

In 1918 a 1,000,000 ac. crop was grown, producing 14,404,000 bu. Following World War I the crop declined in favour and averaged less than 600,000 ac.; by 1937 the average crop for the decade was only about 6,500,000 bu.

World War II had only small effect on production until 1944, when 9,166,000 bu., the largest crop in 16 years, was harvested. This was grown on 575,000 ac. with a yield of 17.8 bu. per acre which was above the average. The season was favourable for the crop, and yields were high in the principal buckwheat states, Pennsylvania and New York. The crop of 1945 dropped back to the average, although the acreage remained above average, and that of 1946 was smaller. About two-thirds of the acreage and production continued to be in Pennsylvania and New York, with Michigan and Minnesota contending for second place.

Over half of the buckwheat crop was used as livestock feed and about one-fourth was ground into flour for human consumption. The old-fashioned buckwheat cake did not gain in popularity during the decade 1937–46, and most of the flour was used in pancake mixtures. Prices of buckwheat to growers averaged about 60 cents per bushel in the prewar period but increased to \$1.48 in 1945, and to \$1.67 in August 1946. Very little of the U.S. grain entered foreign trade. Canada grew about 4,000,000 bu. annually, most of it in the eastern provinces of Ontario and Quebec.

BIBLIOGRAPHY.—For statistics of production, U.S. Dept. Agric., Agricultural Statistics. (J. C. Ms.)

Budapest

Budapest, capital of Hungary, had a population of 1,115,877 by the 1939 census.

Although Hungary declared war on the Allies in 1941, the country was not invaded until late in World War II. In Nov. 1944, Russian troops closed in on Budapest and by Dec. 26 had ringed the city. The German garrison thus trapped fought savagely during a 50-day siege that ended on Feb. 13, 1945. During the fighting for the city the defenders emptied department stores, the university, commercial and government buildings and filled them with war supplies, connecting the buildings by underground passages. The city thus became a fortress. All seven bridges across the Danube connecting Pest with Buda were blown up by the defenders, and barricades were formed by dumping pianos and similar objects out of warehouse windows into the streets. Russian troops shelled the city from Andrassy, four miles away, gradually closing in and finally driving the Germans out of Pest into Buda on Dec. 30. From Pest the invaders fired into Buda, while bombers added to the wreckage of the city, and hand-tohand encounters were fought from building to building, block by city block, in battles that favoured first one side and then the other. Although the Hungarian govern-

ment signed an armistice with the U.S.S.R. on Jan. 20, 1945, and declared war on Germany, fighting continued in Buda between small pockets of isolated nazis and the Russians, the Germans still maintaining control of many buildings. Finally, out of ammunition, in a wrecked city, resistance ended. More than 159,000 German and Hungarian troops were killed or captured in fighting for control of Budapest, the largest axis loss in personnel after the battle of Stalingrad.

Budenny, Simeon Mikhailevich

Budenny (1876—), soviet army officer, was born April 25, 1876, at Koziurin, in the Don Basin. The son of a Cossack farmer, he entered the imperial army in 1903. After the start of the Russian revolution in 1917, he was elected president of the divisional soviet of Caucasian troops. Although not a communist, he soon found himself attacked by the "Whites." With a force consisting of only a few friends and relatives, he started guerrilla warfare against the "Whites." His forces increased and by 1918, he joined the Red army and a year later the Communist party. He became commander of the first Red cavalry army and took an active role in the fighting against Wrangel and in the Polish campaign (1920). Later, he was made chief of the Red cavalry.

Entering the Moscow military academy, he was graduated in 1932 and was made a marshal of the soviet union in 1935. He took a leading role in the Russo-Finnish War, 1939-40 and was made first vice commissar for defense in Aug. 1940. In July 1941, after the Germans invaded the soviet union, Budenny was made commander in chief of soviet armies defending the Ukraine. In compliance with Joseph Stalin's "scorched earth" policy, he ordered the blasting of the Dnieper river dam in Aug. 1941. He was shifted from the southern front, Oct. 23, 1941, and was charged with formation of new soviet armies. Budenny re-

ceived the Order of Lenin in 1943 and 1945 and the Order of Suvorov in 1944.

Budgets, National

A national budget sets forth the expenditures and receipts of the government and a balanced statement showing the condition of the government's finances at the end of each period. In the United States, the Budget and Accounting act of 1921 provided for a national budget system and created a bureau of the budget to prepare for the president the budget of the U.S. government. The act directed the president to submit to congress on the first day of each regular session a budget presenting the expenditures and receipts of the federal government for the fiscal year just completed, estimated expenditures and receipts for the current and ensuing fiscal years and balanced statements showing the condition of the treasury at the end of each of these periods. The act provided that the budget document should also include discussion of the financial condition of the government and recommendations on the many aspects of government fiscal policy.

Instrument of Government Policy.—During 1937–46, the U.S. budget underwent substantial change. At first, the requirements of economic recovery and, later, the requirements of total war transformed the budget into the major expression of government economic policy.

In the early years of its conception, the budget had been utilized primarily as a mechanism for determining the prospective balance between estimated revenues and contemplated expenditures of the government. Although a few economists and others recognized that government fiscal policy had an influence upon general economic conditions, such considerations did not enter into the practical task of budget making. The purpose of budgeting by the government was merely to assist in allocating revenues to the more important functions of government and, in the process, to reveal possible economies in government operations. Whatever control over the level of economic activity that might be necessary was considered to be a function of the Central Bank system, to be effected by the customary tools of monetary policy.

This conception of the role of budget making was not challenged in the early days of the New Deal administration. In fact, the Roosevelt administration at first tried to apply the conventional ideas of sound government finance even more drastically. One of its first official actions was a sharp curtailment of many types of government expenditures in an effort to make good on its campaign pledge to balance the budget. However, as it became apparent that this policy was not bringing economic recovery, the administration abandoned orthodox fiscal ideas and embarked upon the policy of using government expenditures to provide re-employment. From 1934 until the end of the decade 1937-46, the government's budget provided substantial sums for such programs as work projects, power facilities, public highways, schools, recreation facilities, public buildings and others designed to provide jobs and to raise the level of the national income.

The budgets of the Roosevelt administration also differed from their predecessors in providing for the new social programs assumed by the federal government during these years. To some extent the federal government undertook functions which were formerly restricted to state and local governments, but other functions were undertaken that were entirely new government responsibilities. Pro-

vision for relief, social security, railroad retirement, slum clearance, aids to youth, reforestation and agricultural rehabilitation came to be familiar items in the federal government's budget. Thus, from programs that embraced the objectives of both recovery and reform, government expenditures were substantially increased in the latter half of the 1930s. While government revenues were increased by means of new and higher taxes, substantial deficits were a characteristic feature of the budget during this period.

The changes which occurred can be highlighted by contrasting the budget of a pre-New Deal year like 1931 with that of a year like 1939, when the New Deal program was fully formulated.

Federal government expenditures in 1931 totalled approximately \$4,092,000,000, whereas in 1939 the total was \$8,765,000,000. In part this rise was caused by increased outlays for functions and expenses existing in 1931, such as national defense, the legislative, judicial and civil establishments, public highways, improvement of rivers and harbours, flood control, interest on the public debt, etc. In the main, however, it resulted from the new activities of the federal government, such as the Agricultural Adjustment program, \$782,000,000; social security, \$347,000,000; railroad retirement, \$110,000,000; Tennessee Valley authority, \$41,000,000; grants to public bodies for public works, \$379,000,000; direct relief, \$104,000,000; work relief (WPA, etc.), \$2,283,000,000 and the Civilian Conservation corps, \$290,000,000. Expenditures for these items in the fiscal year 1939 totalled \$4,336,000,000.

Concurrently with this rise in expenditures there was an increase in government revenues derived from various new taxes, higher rates on existing taxes and increased receipts flowing from the general expansion of economic activity. By 1939, total revenues had expanded to \$5,667,824,000, in contrast to the 1931 total of \$3,189,639,000. A substantial increase in government revenues came in the area of direct taxes on individuals, where the 1931 receipts of \$882,000,000 rose to \$1,390,000,000 by 1939. Direct taxes on corporations increased from \$1,026,400,000 to \$1,277,000,000 over the same period while the receipts from excise taxes advanced from \$521,300,000 to \$1,755,000,000. Employment taxes, levied to finance the social security program, yielded \$740,000,000 in 1939 whereas in 1931 such taxes were not a part of the federal revenue structure.

With government expenditures rising much more than revenues, the budget operated at a substantial deficit during all of the second half of the 1930s. Where there had been a budget deficit before the Roosevelt administration came to office, it was caused by the falling away of government revenues during the depression. In 1931, for example, the deficit was \$902,000,000. The New Deal deficits, however, were in a sense planned deficits, designed to contribute to general economic recovery. In 1939, to take a year fairly typical of the period, the excess of government expenditures over receipts amounted to \$3,600,000,000.

Thus, it may be seen that during these years, the budget was transformed from a financial accounting statement into the primary instrument of the administration's economic program. It was perhaps because of this change in emphasis that the bureau of the budget was transferred from the treasury department to the executive office of the president in 1939.

Effects of World War II.—The outbreak of war in Europe initiated a new period in U.S. budgetary history, a period that was to see the budget expanded to a point where it dominated the entire economy. Even during the

first year of the war, when the scale of the conflict was not yet apparent, an increase in national defense expenditures was undertaken. Such expenditures amounted to \$1,711,000,000 in the fiscal year of 1940 as compared with \$1,251,000,000 in the previous year.

With the fall of France and the Low Countries in May 1940, the scale of the government's rearmament program was considerably increased. In June of that year, the president set the size of the program at \$5,000,000,000, but this figure was continuously revised upward as the vast plan of nazi aggression was revealed in the battle of Britain and the attack on the U.S.S.R. Through the leadership of President Roosevelt, the nation became determined not only to create strong national defense forces, but also, by means of the lend-lease program, to become the "arsenal of democracy." Both the scale and the tempo of the rearmament effort could be seen in the budget expenditures for national defense. These reached a figure of \$6,301,000,000 in the fiscal year of 1941 and rose to \$26,011,000,000 in the fiscal year of 1942.

It was not until the actual entrance of the United States into the world conflict in Dec. 1941 that the full impact of the war upon the budget was revealed. The first war budget of the president, submitted to congress approximately a month after Pearl Harbor, demonstrated to the nation and the world what was to be the answer to that act of aggression. From the outset, it was clear that the government intended to mobilize the nation for total war and that the full weight of U.S. economic strength was to be used in a fight to the finish with the axis powers. While the president's war program of 60,000 planes a year and 6,000,000 tons of merchant shipping was to be proved conservative by later accomplishments, the request in his first war budget for war expenditures of \$53,000,000,000 set the pattern for the all out character of the U.S.'s war effort that was to be followed during the entire period of the

In its actual results, war production (q.v.) far surpassed the goals set by the president. National defense expenditures in the fiscal year of 1943 reached \$72,109,000,000 while in the peak year of the war effort they rose to \$90,029,000,000. In terms of munitions production, the president's goals were more than doubled by the output of planes, tanks and ships, which the U.S. economy produced.

In the area of non-war government expenditures, the goal of curtailment to a minimum basis was set in the early stages of the war. Because of various pressures and the time required for bringing programs to a close, this objective was not achieved immediately. By 1945, however, the nonwar functions of government were virtually on a minimum basis. In some of the areas of government expenditures, this did not show up in the budget figures owing to the fact that rising prices and wages, a consequence of wartime inflation, tended to maintain the level of expenditures. It may be seen, however, that aids to agriculture had declined to \$602,000,000 in fiscal 1945, compared with \$1,042,-000,000 in 1939, and that expenditures for the general public works program dropped from \$518,000,000 to \$291,-000,000 during the same period. Furthermore, expenditures for such government functions as work relief, direct relief and aids to youth, which had amounted to \$2,982,-000,000 in 1939, were virtually eliminated from the budget by 1945.

On the other hand, it was apparent that a few categories of budget expenditures would be substantially increased for many years to come as a consequence of World War II. By 1945, expenditures on aids to veterans had expanded to \$2,044,000,000 in contrast to the prewar level of little more

than \$500,000,000. Payments of interest on the public debt also rose substantially with the increase in the debt outstanding. Interest payments in 1945 totalled \$3,617,000,000 compared to \$940,000,000 in

From the very start of the expansion of the U.S. national defense program, congress enacted legislation to increase government revenues and in every year from 1940 to 1943 new tax legislation was passed. Income taxes on individuals were raised to the highest level of the nation's history, and excise taxes on commodities and services were substantially increased while the list of goods subject to tax was very much enlarged. The corporate income tax was soon raised to 40% of taxable income and an excess profits tax with a very high rate schedule was imposed on corporate earnings. The general goal set for government revenues was approximately 50% of expenditures. While the government desired a high level of revenues to hold down the amount of the budget deficit and to act as a brake upon the inflationary impact of the huge volume of government expenditures, the fiscal instrument was not the primary means utilized to combat wartime inflation. The main reliance of the government was placed, rather, upon administrative control of prices, rationing of goods to consumers, allocation and priorities of materials, supplies and equipment and renegotiation of war contracts as experience demonstrated that lower prices were feasible.

Nonetheless, government revenues were very materially increased. At the peak of the war effort in 1945, receipts of the government totalled \$47,740,000,000, compared with \$5,668,000,000 in 1939. By far the largest part of the increase came from direct

taxes on individuals and corporations. By 1945, direct taxes on individuals, largely accounted for by the individual income tax, yielded \$19,789,000,000 while the corporate income and excess profits taxes produced \$16,-399,000,000 in government revenues. In 1939 taxes on individuals had amounted to \$1,390,000,000, and the corporation income tax had yielded \$1,277,000,000. With respect to excise taxes, the volume of goods upon which taxes could be levied actually decreased in the course of the war as production facilities were converted to the munitions program. The high rates of tax imposed, however, and the extension of the list of commodities subject to tax, produced a substantial increase in excise tax yields. The 1939 receipts of \$1,755,000,000 rose to \$5,935,000,000 in 1945. It may be noted in Table I on the preceding page that there was a very large rise in miscellaneous receipts as the war progressed. This was accounted for in large measure by receipts from the renegotiation of war contracts.

As government expenditures increased far more than revenues during the war, there occurred a tremendous increase in the annual budgetary deficit. The annual deficit reached levels which dwarfed prewar figures, while the total public debt increased to magnitudes never before contemplated. The excess of expenditures over receipts reached its peak in 1943 with a total of \$55,900,000,000 as against \$3,600,000,000 in 1939. Although war expenditures rose substantially from 1943 to the peak year of 1945, the operating deficit actually declined because of the doubling of tax revenues that followed the tax bill that was enacted late in 1942. Even in fiscal 1945, however, the operating deficit of \$53,948,000,000 was only \$2,000,000,000 less than the peak of 1943. The magnitude of the accumulated deficits of the war years could be seen in the increase of the public debt, which rose from \$40,440,000,000 in 1939 to \$258,682,000,000 at the end of the fiscal year of 1945.

Reconversion.—As soon as the war in Europe was concluded, the government began the curtailment of its war production program. The fact that huge stocks of war matériel had been built up in preceding years made it possible to slow down the rate of current output, even though victory had not yet been achieved in the Pacific. When that victory was won in the late summer of 1945, the immediate liquidation of the war production program was undertaken. The effect of these actions was already dramatically apparent in the budget expenditures for national defense in the fiscal year 1946, when outlays for this purpose dropped almost half to a figure of \$48,542,-000,000. The liquidation was so rapid it was expected that by 1947 national defense expenditures would be down to \$18,978,000,000. While this total was only a fifth of the wartime peak of defense expenditures, it was by far the largest sum ever expended for military purposes in a peacetime year. In part it represented the substantial cost involved in the occupation of enemy countries, but in part it reflected the unsettled condition of international relations and the fact that real postwar disarmament had not yet been achieved.

That the budget of the federal government was likely to remain for a considerable time much above its prewar size was indicated also by several types of expenditures that were outgrowths of the war. Interest on public debt for the fiscal year 1947 was budgeted at \$5,000,000,000, compared to \$3,617,000,000 two years earlier. The cost of veterans' pensions and benefits was estimated at \$6,205,000,000, compared to a little more than \$2,000,000,000 in 1945, and only \$500,000,000 before World War II. The

"Another Man Who Came to Dinner," cartoon by Shoemaker of the Chicago Daily News reflecting the U.S. taxpayers' postwar grievances in 1946. Tax reduction and a decrease in government payrolls was the first pledge given constituents after the Republican landslide in the 1946 congressional elections

new international obligations of the United States were reflected in an item in the budget for international finance appearing for the first time in 1946 with an outlay of \$833,000,000.

This item for fiscal 1947 was estimated at \$3,093,000,000. The influence of the reconversion of the government structure to a peacetime basis could be noted in the general increase in the budget allotments to most of the nonwar functions of government. While government expenditures of a peacetime character were being held in check because of the shortage of materials and manpower in the economy, most governmental functions were incurring increased costs because of the higher level of prices and wages which prevailed and because of certain essential enlargements of government operations. For example, expenditures for aids to agriculture were expected to rise from their wartime low of \$602,000,000 in 1945 to \$1,346,-000,000 in 1947. Similarly, expenditures on public works were expected to advance from \$291,000,000 to \$787,000,ooo for the period. In the area of general government, the trend of outlays was generally upward because of rising wage scales and because various functions performed by war agencies during the war had to be taken over by the regular government departments as the war agencies were liquidated. Whereas expenditures for the civil departments had been \$1,058,000,000 in fiscal 1945, they were estimated at \$1,683,000,000 in fiscal 1947.

Government revenues also began to decline after the end of the war, though to a much less extent than expenditures. Wartime tax rates were substantially maintained in the immediate postwar period, the significant exceptions being the excess profits tax on corporations and a small reduction in the personal income tax. From the high wartime level of taxes in 1945 of \$47,740,000,000, the government's receipts for 1947 were estimated at \$40,919,000,000.

Virtually all of this cut was in the taxes on corporations, which declined from \$16,399,000,000 in the last year of the war to an estimated \$9,762,000,000 in 1947. While there was a decline of more than \$1,000,000,000 in the receipt of taxes on individuals, this was approximately offset by an increase in excise tax receipts flowing from the expansion in civilian goods production.

This policy of maintaining a high level of government revenues in the immediate postwar period as the wartime level of expenditures was being drastically curtailed, resulted in a major cut in the budget deficit. The excess of expenditures over receipts, which was in the neighbourhood of \$56,000,000,000 a year during the war, dropped to \$21,981,000,000 in fiscal 1946, and was expected to be down to only \$1,440,000,000 in 1947. Not since the early years of the 1930s had the budget deficit been so low.

The prewar tendency of the budget and the budget message to reflect the economic programs and policies of the administration was accentuated during the war years. This development took place in countries other than the United States, notably Great Britain, because the huge magnitude of the war programs made it virtually impossible to ignore the repercussions on the economy of the government's fiscal and economic operations. In his 1946 budget message, the president took another step in this direction and showed the trend of his thinking with regard to the postwar responsibilities of the government. This step was the presentation of an analysis in tabular form of the relation between the government's budget and the nation's budget, shown in Table II (p. 443). The data in this table were derived from the statistics of national income and gross national product and were set up so as to reveal the receipts and expenditures of the major economic groups of the nation-consumers, business, state and local government and federal government.

The British Budget.—The budget of Great Britain began to reflect the German threat to peace in Europe from about the middle of the 1930s. Budget expenditures for national defense in the fiscal year 1936–37 of £186,000,000 already represented a sharp increase over the previous year. Defense expenditures were further increased in the two succeeding years and in the fiscal year 1939–40 amounted to £218,000,000 of regular military appropriations plus £408,000,000 that was added in a vote of credit after World War II broke out.

The first war budget of Great Britain, covering the fiscal year 1941-42, was in many respects a revolutionary document; it was based on the economic réquirements of total war. Prepared under the direction and influence of John Maynard Keynes, it was not only an innovation in the scope of its fiscal measures but in its logical presentation of the relation between economic and fiscal needs. It set a model in the art of budget making and presentation that was followed throughout the war by British government, and in fact by other democratic countries, including the United States.

On the side of expenditures, a budgeted total of £4,502,000,000 was provided for, over £4,000,000,000 of which was required for the prosecution of the war. The budget message was concerned primarily with the problem of how this vast sum could be spent by the government for war purposes while avoiding an inflation of prices and the cost of living. It was made clear that this problem had to be met by eliminating the "inflationary gap"—the excess of total private and government expenditures over the total goods and services available for purchase. This emphasis on the inflationary gap represented a conceptual innovation of great importance, for it implicitly recognized that

the budget deficit as such was irrelevant for the problem of war finance. What it meant in practice was that the chancellor of the exchequer was interested in offsetting the inflationary gap, which he estimated at about £500,000,000, rather than the budget deficit of £2,420,597,000. Since closing the gap necessitated a reduction in total expenditures, and since the government expenditure was necessary for the war effort, it was evident that private expenditure would have to be reduced. Otherwise inflation would be inevitable. It was proposed that half the gap be met by increased taxation and half by increased saving on the part of the public.

The new taxes were to be obtained from increased individual and business levies. Under the new rates and lowered exemptions, taxes on the highest income bracket were raised to $87\frac{1}{2}\%$ while at the lower end of the income scale 2,000,000 new taxpayers were affected for the first time. An unmarried worker earning £110 and a married worker with 2 children earning £270 would in 1941 pay an income tax. As a result of the increasing taxes, government revenues were approximately doubled from the fiscal year 1939-40 to 1941-42.

During the remaining years of the war, both government expenditures and receipts continued to rise, although the essential pattern of the budget set in 1941-42 was adhered to. Total expenditures and the vote of credit for war purposes reached their peaks in the fiscal year 1943-44, with figures of £5,789,000,000 and £4,950,000,000, respectively. The peak of revenues, on the other hand, came in the year 1945-46 with a total of £3,284,000,000, more than a third larger than the receipts obtained in 1941-42.

Although the end of the war came with more than half of the fiscal year yet to come, there was little immediate effect upon the British budget for the fiscal year 1945-46. It was not until the following year that any substantial curtailment was effected, and even then the magnitude of Britain's postwar responsibilities for national defense and reconstruction could be readily seen. It was expected that defense expenditures would be curtailed to £1,667,000,000 from the wartime peak of just under £5,000,000,000. However, the civil expenditures of the government were expected to rise to £1,652,000,000 from the previous year's total of £589,000,000.

On the side of revenues, the only significant reduction was in the case of the income tax, where a decline of £270,000,000 was anticipated. Total revenues of £3,161,000,000 were estimated for the fiscal year 1946–47 as compared with £3,284,000,000 in the previous year. (M. GT.)

Europe and the British Commonwealth.—The budgetary figures of the countries of Europe and of the British commonwealth during 1937-46 clearly reflected the secularindeed, millennial-trend toward bigger and bigger figures in almost every sphere of human activity. This trend had been occasionally interrupted by brief periods during which deflationary efforts and economy campaigns resulted in a temporary reduction of the budgetary totals. Such relatively moderate declines had been, however, considerably more than offset by the accentuation of the upward movement during wars. Within a few years, both revenue and expenditure were raised to a multiple of their prewar levels, and even though the termination of wars had been followed by a drastic reduction from the peak reached during the wars, the level at which postwar budgets settled down was usually considerably above the prewar figures.

To this general rule the experience of World War II provided no exception. All countries, whether within or

outside Europe, whether belligerent or neutral, showed a spectacular increase of their expenditure after 1936. Already during the last few years before World War II the abnormal requirements of wartime cast their shadow before them. Practically every nation within striking distance of Germany-which included the whole continent of Europeand Great Britain and its dominions began to arm themselves. In the light of their gigantic war expenditure, the increases in their budgets during 1937 and 1938, and even 1939, appeared moderate in retrospect.

Related to peacetime conditions, when most governments endeavoured to keep their expenditure within the limits of their revenue, the increases of prewar years were, however, substantial. Unfortunately no authentic figures of German expenditure were available. Nor were the figures for Italy very dependable. Otherwise it would have been possible to show statistically the striking contrast between the modest efforts of the peace-loving nations and the ruthless rearmament drive carried out by the aggressors regardless of expense. While the democratic countries tried to raise their revenue more or less in accordance with their growing expenditure, Germany, and to a smaller extent

Italy, were piling up deficits by thousands of mil-

There was no fundamental change in the budgetary trends during the period known as the 'phony war." Its outstanding characteristic was the gross inadequacy of the economic war efforts of the democracies. The conversion of their industries to war requirements was proceeding at a snail-like pace, not only during 1939 and 1940, but even in 1941. It was not easy for Great Britain and other countries to make good in a few months the omissions of many years. Unaccustomed as they were to planned economy, efficiency in organizing their production drive for a long time left much to be desired. With the best will imaginable, the governments were unable to increase their expenditure to anything like the extent desired. The expenditure figures of the first war years expressed in their terms the inability of munition production to increase output.

From 1942 onward, the expenditure figures of the democratic countries showed a more encouraging tendency. Arms production was gathering momentum, and the amounts spent on it showed a steep

rise. It was not until 1943 or 1944, however, that the peak figures were reached. While Germany from the very beginning of the war produced arms to the limit of its physical capacity, the Allies had to take hard knocks for years, owing to the slow pace at which they managed to mobilize and make the best use of their economic war potential. Once mobilization was complete, the axis was doomed. The rise of expenditure figures during the years 1942, 1943 and 1944 foreshadowed the crushing blows that the Allies would soon be able to deal their opponents.

Budgetary revenue was even slower in rising to its peak level than budgetary expenditure. While the governments of belligerent countries strained every nerve to increase their arms expenditure they were for a long time reluctant to enact the maximum of financial sacrifices from their nationals. In many instances they underestimated at first the willingness of citizens to contribute toward the burden of financing the war. Year after year the British parliament went through the same unusual experience during budget debates: the members of an institution originally created mainly with the object of moderating the appetite of kings for more taxation were criticizing the government for not taxing the country sufficiently.

By 1944, however, in Great Britain as in other countries, the limit was reached beyond which any further increase of taxation would have defeated its object, for it would have led to a decline in production and earnings. By that time a tendency prevailed toward an increase of revenue even in the absence of any additional taxation, as a result of the citizens' growing taxable income brought about by the vast scale of government expenditure, the increase of the number of employed to unprecedented figures and the additional earnings secured through working abnormally long hours. The trend of prices and basic wage rates was also in an upward direction, even though the policy of most governments, which aimed at moderating their use, was remarkably successful.

Notwithstanding the considerable increase of revenue, its total volume necessarily lagged behind the rise in expenditure. A deficit is in fact inevitable in time of major wars. Any attempt at balancing the budget either through keeping down expenditure or through raising revenue to the level of expenditure would have gravely handicapped production and would have been highly detrimental to the major interests of national defense. The remarkable feature of the wartime budgeting figures was the relative smallness of the deficit, especially during the later war years.

The figures available in 1946 for the postwar period were not sufficient to give a clear picture of the postwar budgetary trends. Most countries achieved a reduction of their expenditure but figures showing the full extent of the economies attained as a result of the demobilization and reconversion to peacetime production were not yet available. Nevertheless, it was evident that expenditure would remain very high compared with prewar figures. This was owing in part to the increased burden of public debts, and in part to the permanent increase of non-military expenditure on account of new social security measures and the growth of the civil services necessitated by the extension of government control in the economic field. Military expenditure itself remained high, owing to the determination of most countries to maintain their national defense in a better state of readiness than it was found at the outbreak of World War II.

These general considerations apart, there were in addition particular tendencies affecting the budgets of individual countries or groups of countries. One of these features

was the remarkable financial war effort of some countries of the British commonwealth, overshadowing relatively even the immense effort of Great Britain. The capacity of Canada, Australia and other dominions to take their share in commonwealth defense was not adequately realized until World War II. Their war budget figures showed the mutual character of assistance within the commonwealth since their total financial contribution to the common cause (even with India omitted) bore comparison with that of the mother country.

French budgetary figures indicated the peculiar trends prevailing in the budgets of countries once part of German-occupied Europe. Even though France was out of the war by the middle of 1940, its expenditure continued to grow as a result of the heavy burden of occupation costs. But even its civil budget showed a steep rise. Inflationary tendencies were produced by German methods of exploitation, through which the occupied countries were depleted of their supplies of goods while the Germans created fictitious purchasing power in the hands of the public.

In the U.S.S.R., as in other belligerent countries, civil expenditure underwent a sharp increase during the war. According to the published figures, this expenditure at any rate was fully covered by revenue.

The figures for Switzerland showed the extent of the burden that the war imposed even on neutral countries anxious to defend their neutrality. Although very moderate in comparison with the sacrifices made by belligerent countries, there was an increase of expenditure during the early years of the war, and again at the end of the war. What was more significant was the drop in the revenue, caused in part by the state of mobilization and in part by the decline in earnings caused by wartime conditions which, unlike those prevailing during World War I, were not of a boom-like character.

Many budgets for 1946 showed the effect of the postwar inflation which became a major factor in Europe, overshadowing in importance even such factors as war expenditure or occupation costs. There were a number of countries of which the budget figures surpassed their wartime peaks and were moving toward new high records instead of tending to settle down at a new peacetime equilibrium. (See also Debts, National; Income and Product; Taxation and articles on individual countries.) (P. Eg.)

Buenos Aires

Buenos Aires, capital of Argentina, is located on the southwest bank of the Plata estuary. The city is the natural centre of the fan-shaped pampas region which forms its hinterland and is one of the richest agricultural areas in the world. Estimated population in 1945 was 2,608,333; earlier estimates were: 1941 (municipal census), 2,515,726; 1943, 2,557,586; 1944, 2,595,861. With suburbs included, the total population was almost 3,500,000; Avellaneda,

with a 1944 population of 399,021, is the largest and most important of the suburbs. Buenos Aires is the largest city in Latin America, the largest in the southern hemisphere, and the largest Spanish-speaking city. It is South America's largest port and Argentina's most important industrial and cultural centre, long noted for its cosmopolitan atmosphere. In terms of spacious and well-improved streets, beautiful public buildings, parks and recreation facilities, Buenos Aires is one of the notable cities of the hemisphere. Much of the municipal improvement was accomplished during the decade 1937–46.

The program of urbanization undertaken by municipal authorities led them in 1937 to plan floating a bond issue in New York city for the purpose, but the issue was subsequently made and subscribed in Buenos Aires on Aug. 6, 1937. Certain financial questions later led to the suspension of Buenos Aires bonds on the New York Stock exchange on Oct. 2, 1937; quotation of the issues was removed entirely the following year. Reorganization of the municipal police department occurred in June 1940 following charges that some of its members had failed to co-operate in the local investigation of nazi activities. Difficulties between local and national authorities came to a head late the following year, when the national cabinet council, under the chairmanship of Acting President Ramón S. Castillo, dissolved the municipal council on Oct. 10, 1941, because of various scandals that had characterized the municipal government. The ousted council later met in a Buenos Aires café and appeared to be supported by a considerable segment of local public opinion. Buenos Aires leaders of the Radical party denounced Pres. Castillo for the action, and the ousted council members announced their intention to appeal the removal to the national supreme court. Efforts to regain their seats proved unsuccessful, however. The coup d'état on June 4, 1943, which led to the supplanting of Pres. Castillo by an army group, resulted in the resignation on June 7, 1943, of the municipal alcalde or mayor, Carlos Alberto Pueyr-

Citizens of Buenos Aires celebrating the victory of Juan Perón in the 1946 presidential election. Final tallies gave Perón 304 electoral votes, and 72 to his opponent, José Tamborini

redón. Gen Basilio Bertine was appointed on June 12 as his successor. During the presidential campaign in 1945–46, culminating in the election of Feb. 24, 1946, Buenos Aires was the scene of repeated political disorders and rioting, engendered especially by the activities of the descamisados (shirtless persons) supporting Juan D. Perón for the presidency.

Building and Construction Industry

At the beginning of the decade 1937–46, the volume of U.S. construction activity was greatly influenced by the pump-priming public works program, and by a revival of home building. In 1940, the defense program spurred industrial building. With the advent of World War II, the U.S. was a beehive of construction activity, concentrating upon war needs—factories and camps, farm service buildings, homes for workers in war industries and military encampments. With the cessation of hostilities, industrial, commercial, residential and public works interests all wanted to build. There were not sufficient quantities of building material, so industrial, commercial and public works activities were curtailed by governmental order and residential construction was encouraged.

Source Construction division, department of commerce Figures for 1944, 1945 and 1946 are joint estimates of the department of commerce and department of labour Figures for private residential (excl. farm) are department of labour estimates in all years.

According to the department of commerce survey of current business, public works during 1938 accounted for 47% of the total construction, compared with an average of 22% during the 1920–29 decade and 41% in 1937. Residential building also proved to be a great bulwark to business recovery. The number of family dwelling units upon which construction was started was the greatest since 1929. The Federal Housing administration (FHA) mortgage guarantee system was given credit for creating this activity

The building industry was called upon during the early years of World War II to provide vast housing facilities for army trainees at camps throughout the U.S. Above, Fort McClellan, Ala., nearing completion in 1940

and for emphasis upon the construction of a volume of moderately priced homes to meet moderate income demands. The United States Housing authority, created in 1937 to make loans and grants to localities for housing for low-income families and for slum clearance, inaugurated its program in the early years of the decade and was in full flush of activity when the United States entered World War II.

But the year 1942 saw an almost complete cessation of construction in the U.S. except for military or war production purposes. All normal construction of industrial, commercial, residential and public works was stopped. In order to build, it was necessary to apply for materials priolities, which were granted according to the military importance of the contemplated project. A No. 1 priority was certain to produce materials. A No. 4 priority was often merely a hunting licence.

Normal construction was stopped because material and manpower were required for the war effort and there was not enough of either to serve normal and war purposes. In order to save materials, the National Housing agency (NHA) and the War Production board (WPB) restricted home building by (1) giving priorities for building only for workers in areas where there were no available dwelling units; (2) curtailing the number of family dwellings built; (3) curtailing the amount of critical material used in family dwelling units; (4) programming a large quantity of temporary family dwelling units using less critical material than permanent units would use, and a large quantity of dormitory units and apartments using less critical material per person than would be used in family dwelling units; (5) urging the conversion of large single family houses,

lofts, office buildings, etc. to multifamily use; (6) urging families in war production areas to rent all spare rooms to war workers; (7) encouraging builders to use substitute materials.

Public construction expenses rose during the war years. Outlays for military and naval construction from Jan. 1940 to Aug. 1945 totalled \$10,895,000,000. Publicly-financed industrial facilities totalled \$8,445,000,000. Outlays for educational, hospital and institutional, other nonresidential building, highway, sewer and water, and miscellaneous public service enterprises were \$5,570,000,000. Permanent and temporary publicly-financed war housing totalled \$2,220,000,000.

During the war, the shortage of critical materials encouraged experimentation with new methods of construction, new materials and new ways of using old materials. The incentive to experiment was provided by the necessity of saving metal, lumber and certain plastics for the materials of war; by the importance of speed and quantity production; by the need to use a minimum of manpower, and by the knowledge that a large postwar market would be attainable if the cost of production could be reduced.

The shortage of materials continued after the war's end. The demand was greater than the normal supply and in most instances the supply was far below normal. There were many reasons for the subnormal supply. War requirements had demanded different specifications, and factories had to reconvert to peacetime stocks. In reconverting, they chose to manufacture the types of supplies which carried the greatest profits and they did not make those items which were less profitable; they could keep their plants busy with the more profitable articles (nails were in this category and were not produced until after strenuous efforts). The Office of Price Administration (OPA) trying at first to avoid inflation, refused to make the price adjust-

ments which the trade thought necessary; many price adjustments were considered too small. Strikes kept basic industries like the steel industry idle. Table II gives a comparison of production of key materials for the years 1937-46.

Because the demand for building materials exceeded the supply, it was possible for black marketeers to thrive. Government regulations were circumvented. It was estimated that 75% of the supplies found their way to the black market. In some areas as much as 95% of some materials found its way into the black market.

In an effort to step up construction and the production of building material, and to pursue the war-born effort to find substitutes for scarce items, congress passed the Veterans Emergency Housing act on May 22, 1946, providing among other things for \$400,000,000 in premium payments for scarce materials and market guarantees for new materials and factory-built houses. Premium payment programs to increase the output of brick, structural tile, plywood and gypsum-board paper liner were started in June; of northern and southern hardwood flooring, convector radiators, and iron soil pipe in July.

The increase of more than 3,600 tons of merchant gypsum liner in July over April was attributed by the housing expediter, Wilson W. Wyatt, largely to the premium payment plan, authorizing payments of \$40 a ton for production of liner in excess of quota. Computed on the basis of one ton of liner to 12,500 sq.ft. of board and lath, sufficient for five homes, it was estimated that the increase could provide for more than 18,000 veterans' homes. But the increased production of liner did not have immediate home-production effect because there was a lag between its production and the production of finished board and lath.

Brick production jumped 11% in June 1946, the first month of operation of the premium payment plan, and rose an additional 17% in July.

Production of cast-iron soil pipe, termed "the most critically short of all building material" was aided on Aug. 7, 1946, by a \$40 per ton premium for all Saturday production in excess of quota, providing that Saturday was the sixth day worked during the week, and \$10 per ton for all other production in excess of quota. Previously, the industry had found it unprofitable to produce beyond a five-day week, so the \$40 Saturday premium was conceived to compensate producers for extraordinary expenses incurred in a six-day operation.

To expedite lumber production, the national housing expediter made \$10,500,000 available in June and July 1946 to the secretary of agriculture for the immediate start of construction of access roads to out-of-the-way government timber lands. The new roads were expected to add about 90,000,000 bd.ft. to the 1946 production and 500,-000,000 to 600,000,000 bd.ft. in 1947. The money was allocated from \$15,000,000 made available for access road construction under the Veterans' Emergency Housing act of 1946. An allotment of \$1,234,000 was made in August to the secretary of the interior to construct 222 mi. of access roads to out-of-the-way timber lands on Indian reservations. Wyatt also announced two additional premium payments covering southern and northern hardwood flooring industries. His regulations authorized manufacturers of southern flooring lumber participating in the premium payment plan to pay bonuses of \$8.50 per 1,000 ft. board measure for seasoned lumber, and \$6.00 for 1,000 ft. for green lumber to their suppliers of certain grades and species of hardwood lumber; and manufacturers of northern flooring lumber to pay bonuses of \$3.50 for seasoned and \$1.00 for green. The producers were to be reimbursed in full (Premium A) for what they paid in bonuses to lumber suppliers if their quarterly production rose 10% or more above their established quotas. There were other provisions for reimbursement in full or in part under certain conditions. Adjustments were also made in OPA ceilings.

The housing expediter also entered into an agreement with the state of Washington whereby the federal government would compensate the state for expenses incurred in doubling the number of its "timber cruiser teams"—the men who examine the forests, estimate the volume of timber and perform related duties necessary to prepare offerings of timber. It was estimated that large amounts of Douglas fir, hemlock and ponderosa pine could be offered for sale through the use of additional cruiser teams.

Premium payments and a 10% price increase were given to spur production of convector radiators used for residential heating. The premium provided incentive payments for production in excess of quota of ten cents per "shipment unit" (a sq.ft. of steam radiation obtainable from such convector radiators, as determined by standardized industry ratings).

The housing expediter announced plans for assisting the unconventional as well as conventional builder and the developer of new materials as well as the supplier of existing materials.

The number of manufacturers seeking approval for FHA mortgage insurance of factory-built houses and parts of houses increased substantially with the inception of the Veterans' Emergency Housing program. After March 1, 1946, FHA approved approximately 85 types of such construction as eligible for FHA mortgage insurance. Nevertheless, the production of factory-built homes did not come up to expectation in the first half of 1946.

As material production was being increased in 1946, labour supply was tightening, and a grave construction labour shortage was becoming apparent. To produce 2,700,000 homes it was deemed necessary to triple the Jan. 1946 construction labour force by the middle of 1947. To do this it was necessary to recruit and train 1,500,000 additional workers-not an easy task in the light of apprenticeship requirements and union hesitance to increase ranks beyond the number which they could be expected to carry when construction would return to normalcy. Total construction employment reached 2,250,000 workers in July 1946; 143,000 workers were added that month. The construction volume was about 21/2 times the 1945 volume, the gain being attributed almost entirely to increases in privately-financed work. Public construction in 1946 was largely highway construction and veterans' temporary housing.

Rising construction costs caused laymen, financiers, and builders to wonder about a sustained building boom. Some forecast a buyers' strike. Prices on both homes and building lots rose on a national average from 60% to 65% between 1941 and 1946. From Sept. 1945 to July 1946, the national price rise on building lots and raw land was at the rate of 60% a year. Many people thought that this trend would bring future headaches in its wake. Building in Britain.—The years 1937 to 1939 were years of great activity in the British building industry, but the outbreak of World War II brought normal building to a

standstill. The enormous program of work connected with the war effort was carried out under conditions which were, in almost every respect, abnormal. This program occupied the major part of a steadily decreasing labour force until the end of 1943; during 1944 the clearance and repair of bomb-damaged property, mainly in southern England, assumed first importance in the allocation of priorities. This phase merged imperceptibly into the drive to provide increased living accommodations; this was the principal preoccupation of the industry during the early postwar period. The organization of a rapidly increasing labour force made this period highly abnormal, an effect which was intensified by the increasing influence of changes which had occurred during the war years.

The development of building research had been accelerating noticeably after 1914, and by 1937 its results were significant. Its influence was greatest in the field of manufactured products, where the organization of industry most favoured its application. Wartime conditions saw a concentration on those constructional operations most susceptible to modification; they also brought shortages of certain materials, notably timber, which forced the industry to adopt substitutes and the modifications of construction which they implied. The use of factory-made units to accelerate erection of buildings made some progress, but the change from normal methods was a very difficult one, and the end of 1946 found much of this work still at an early experimental stage.

The ministry of health Model Bylaws (1936) had been intended as a means of standardizing and bringing up to date local building regulations, and the period 1936–39 had seen some progress with this work. Wartime construction for special purposes used methods which would not normally have been permitted, and their apparent success led to the claim that existing methods of control of building were unnecessarily restrictive and extravagant. Concentration of building under central control during the war years undoubtedly assisted the adoption of many new formally defined standards for the quality and performance of building materials and components; the number of published British standards applicable to building work increased from 73 in 1936 to 103 in 1939 and 220 in 1946.

Another important move was made in 1942, when a number of study committees were set up by the minister of works to formulate codes of practice for various sections of building practice. Important developments were expected in postwar years from attempts to reduce the manhours associated with the production of buildings by increasing use of factory-made components and mechanical plant on building sites, and by attention to organization of site labour operations.

The comparative prosperity of the British industry during the period 1937-39 drew attention to the fact that its working conditions did not, in many trades, attract the best type of entrant. The National Joint Council for the Building Industry introduced certain improvements, principal among which were a "holidays with pay" scheme and the establishment of a "guaranteed week." Bricklayers and other tradesmen working on building sites had been liable to considerable loss in wages when bad weather interfered with their work since, in the majority of cases, they were paid only for the actual time during which work was possible. The guarantee of payment for a minimum number of hours per week came first in connection with wartime contracts, but a guaranteed week of 32 hr. was continued when civil building recommenced. The hourly rate for skilled craftsmen in the London area increased from 1s.8d. in 1936 to 1s. 101/2d. in 1940 and to 2s.71/2d. in 1946. A system of bonus payments was introduced with the object of increasing output on certain war contracts. The system was not altogether new and, in certain quarters, continued to be favoured; taking the industry as a whole, however, it was not popular and did not remain in general use after the end of the war.

Large wartime contracts made it possible to give building workers welfare facilities and there was considerable official encouragement for this trend. With the return of more normal contracts, the difficulty of maintaining this provision reappeared and in 1946 it could not be said that any great progress in this direction had been made. Management had, however, by then appreciated that shortage of skilled men in the building industry faced it with a problem more acute than it had previously experienced and that everything possible should be done to sustain the improvement in working conditions brought about by the war if individual firms and the industry as a whole were to be adequately manned.

The postwar personnel problems of the industry were anticipated at a comparatively early stage of World War II. An important study of the building labour force and its postwar expansion appeared in 1941. In the same year Lord Reith set up the Central Council for Works and Buildings to advise him on matters concerning the industry, and recruitment and training were among the first deliberations. At the same time the machinery of the National Joint council of the industry drew up a national scheme of apprenticeship to regulate the recruitment and training of young employees in the skilled trades. The publication in 1942 of a White Paper dealing with the same subject provided opportunity for general consideration of the requirements of the industry and led to the establishment in the same year of the Building Apprenticeship and Training council. Even before the establishment of this last body, the board of education, at the instigation of the ministry of works, had urged local education authorities to extend the provision of junior technical schools for building. The response to this request was notable, and the annual entry to such schools rose from some 300 in 1942 to 6,000 in 1944. Previous experience had shown that such schools provided a very high grade of entrant to the industry and the expansion of their numbers constituted a valuable advance in attraction of the right type of entrant. By 1946, the national scheme of apprenticeship and the Building Apprenticeship and Training council had gone a considerable way toward establishing themselves as permanent features of the industry. Provision was made for the entry into the industry of ex-service men who had undergone special shortened courses of training at ministry of labour government-training centres.

A survey carried out in 1941 by the ministry of works and buildings provided, for the first time, a definite picture of the structure of the industry which, it had long been realized, was unusual in so large an organization. The preponderance of small firms employing fewer than 20 men was used as an argument to support the proposition that organization and management were on the whole less efficient in building than in other large industries.

In 1942, the ministry of works arranged for a mission to visit the U.S.A. to study building methods there. In its report, the mission supported the view that attempts should be made to improve the organization of building contracts in Great Britain. The employers' organizations held that improvements were most likely to result from more complete preparation of a project before inviting tenders and from the avoidance of modifications introduced during the progress of the work, a view which the mission had also expressed in its report.

Fixed price contracts based on a common bill of quantities were general before 1939, but the acceptance of lowest tenders was not altogether satisfactory. In some areas there was a tendency for employers to associate in an attempt to distribute contracts at suitable prices. The instability of conditions during the period 1939-46 resulted in payment being arranged on a "cost-plus" basis, but experience of this method did not suggest that it was suitable for more stable times. Payment for the repair of war damage was arranged on a common schedule of prices drawn up by the ministry of works in consultation with members of the industry but, in practice, many aspects of the working of the method were open to objection. The immediate postwar period was too transitional in character to provide suitable opportunity for experiment in methods of payment; there were, however, some advocates for "fixed fee" contracts whereby a contractor's profit could be fixed and his own interest trusted to secure early completion of the work.

The prospect of labour shortages increased the attention given to the selection of foremen and other problems of supervision. It was, felt that wartime conditions had resulted in a reduction of individual output and there were those who believed that production methods in other industries could be usefully applied to building.

Bulgaria

Bulgaria, a nation in the Balkans, had an area of 39,814 sq.mi. in 1940 with a population of about 6,370,000. Of the territories acquired after that date, only the southern Dobruja, ceded on Sept. 7, 1940, from Rumania, an area of c. 2,900 sq.mi. with a population of 350,000, was to remain Bulgarian. Capital: Sofia. Chief cities: Sofia (est. 1942) 401,000, Philippopolis (Plovdiv) 99,883, Varna 69,944, Russé (Ruschuk) 49,447, Burgas 36,230, Plevna (Pleven) 31,520. Religion: mainly Greek Orthodox; about 1,000,000 Moslems; before 1941 there were about 50,000 Jews.

At the beginning of the ten eventful years, in 1937, Bulgaria represented a moderate royal dictatorship. King Boris III limited the parliamentary influence. On July 4, 1936, Georgi Kiosseivanoff had been appointed prime min-

ister and minister of foreign affairs. On Oct. 21, 1937, a new electoral law was promulgated, providing for universal suffrage for both sexes (an innovation in Bulgaria). Communists, adherents of violence, state and communal functionaries, and persons without gainful occupations were excluded from the passive suffrage. No party nominations or party candidates were allowed.

Early in 1938 there was considerable excitement owing to the continuance of the authoritarian regime. In March, elections—the first after the constitution was suspended in 1934—returned 104 government supporters against 56 of the opposition. On May 22 parliament was opened, and the decree-laws of the preceding four years were confirmed.

In foreign affairs the government sought friendlier relations with Bulgaria's neighbours. A decisive step was taken along the road, entered upon some three years previously, of reconciliation with Yugoslavia by the signature, on Jan. 24, 1937, of a treaty, article I of which simply declared that "there will be inviolable peace and sincere and perpetual friendship between the kingdoms of Yugoslavia and Bulgaria." In fact, relations between the two countries became cordial, and the barbed-wire entanglements on the frontier were removed. The Internal Macedonian Revolutionary organization seemed to have lost its power. A further step in that direction was the signature of the Salonika agreement with the Balkan Entente (July 31, 1938). The latter renounced, so far as the Entente members were concerned, the clauses of the Treaty of Neuilly limiting Bulgaria's armaments, and also the clauses of the Treaty of Lausanne demilitarizing certain zones on Bulgaria's frontiers. The signatories bound themselves to mutual nonaggression. The agreement (which the other interested states accepted) was hailed with rejoicing in Bulgaria, where conscription was re-introduced and rearmament was initiated openly.

The early months of 1939 passed quietly in Bulgaria. Her relations with Turkey and Yugoslavia continued good, but the Rumanian dispute over the Dobruja kept Bulgaria from joining the Balkan Entente. In spite of the overwhelming importance of its trade with Germany, Bulgaria did not accept an offer made by that country in Oct. 1938, to take over all its export surpluses for 12 years in return for German manufactured goods and services. Relations with the U.S.S.R. also improved remarkably, and there were negotiations for increasing the trade between the two countries. On the outbreak of World War II, Bulgaria declared a policy of strict neutrality, but public opinion clearly felt the time approaching when Bulgaria's claims against Rumania in the southern Dobruja could be pressed, and unlike her neighbours, she hailed with some enthusiasm the return of the U.S.S.R. to an active imperialist policy resembling that of pre-1914 Russia. It was Bulgaria's attitude which formed the chief obstacle to the formation of a neutral "Balkan bloc."

Pro-Axis Shift in Foreign Policy.—But in 1940, with the growing success of the axis, Bulgaria inclined more and more toward a pro-German policy, through which she also hoped to satisfy her territorial aspirations. Economically, Bulgaria soon passed under German control. Although she accepted some aspects of nazi policy, including the introduction of the first anti-Semitic legislation in Bulgaria's history, nevertheless she did not join the axis alliance.

King Boris tried, as long as possible, to maintain a neutral attitude. In view of the strained internal situation the king dissolved the parliament, and new elections were held in Jan. 1940. Hopes that the new parliament would be less reflective of the oppositional attitude of the people

were not realized. The government, of course, received the majority of the votes, but this majority was much smaller than expected. Under these circumstances, Prime Minister Georgi Kiosseivanoff, who had ruled the country as the king's confidant for four years, resigned and the minister of education, Bogdan Philoff, an archaeologist and scholar of renown, formed the new government with Ivan Popoff as foreign minister and Ivan Bagrianoff, a declared friend of fascism, as minister of agriculture. The new parliament was opened on Feb. 24, 1940. The only important piece of legislation passed during the spring was a bill re-introducing compulsory military service for all men between the ages of 17 and 65, thus abolishing finally the disarmament clause of the peace treaty of Neuilly.

Re-acquisition in Sept. 1940 of the southern Dobruja, which Bulgaria had ceded to Rumania in the peace treaty of Bucharest in 1913 at the end of the second Balkan War, was greeted enthusiastically by the Bulgarians. The weakening of Rumania under heavy pressure from Germany, the soviet union and Hungary gave Bulgaria the opportunity to re-annex the land without any actual warfare. Southern Dobruja, with a predominantly Bulgarian population, represents a relatively fertile land between the lower Danube and the Black sea; the population includes strong Turkish and Rumanian minorities, the latter to be exchanged for the Bulgarian minority remaining in the northern Dobruja region. On Dec. 29, 1940, the parliament expressed support of the government's foreign policy, which the foreign minister defined as aimed at keeping the country out of war while defending the nation's "vital interests."

These "vital interests"-the fulfilment of Bulgaria's dream of a great Bulgarian empire within the frontiers of the peace of San Stefano (1878)-aligned Bulgaria openly with the axis powers in 1941. Premier Philoff stressed in a speech on Jan. 12, 1941, that Bulgaria should not be influenced by any sympathies but that its policy should be guided by "Bulgaria first" principles, working only for Bulgaria, and never sacrificing anything for allegedly foreign interests. This speech prepared the Bulgarian public for a "neutrality" policy which brought Bulgaria closer and closer to the axis. Soon it became clear that the so-called neutrality policy of the Bulgarian government favoured the entrance of German troops into Bulgaria, thus facilitating their plans of potential aggression against Yugoslavia, Greece and Turkey. The official press clamoured for Greek Thrace, including the area between the rivers Mesta and Struma and the port of Kavalla. As early as Feb. 14, 1941, the Bulgarian foreign office had to admit that the country had agreed to let German armies march through to the Greek border. On March 1 the Bulgarian cabinet had officially decided to sign the axis tripartite pact; accordingly, Premier Philoff and Foreign Minister Ivan Popoff flew to Vienna, where they formally signed the treaty with Germany which gave the Germans the official right to occupy Bulgaria. On the same day the German armies crossed the Danube from Rumania, and from that moment on, the country was fully in axis hands.

German Occupation.—Thereupon, the Allied diplomats left Sofia, while mighty German columns rolled through the land. All liberal and democratic elements in Bulgaria, as well as all those who were in sympathy with the U.S.S.R., went into hiding or were arrested. While the Germans took up positions on the Greek and Yugoslav borders, the Bulgarian army was mobilized along the Turkish frontier. Although, according to the Bulgarian premier, the task of the German troops in Bulgaria was "to safeguard"

the peace and tranquillity of the Balkans," in reality they had gained those strategic positions which allowed them, in the beginning of April 1941, to deal quick and decisive blows to Yugoslavia and Greece.

As soon as the German troops smashed into Yugoslavia and Greece and defeated the armies of these two countries, Bulgarian troops, which had not participated in the fighting or conquest themselves, began to occupy part of the Greek and Yugoslav territories conquered by the Germans, especially Thrace and Macedonia. To the seven provinces of Bulgaria three new ones were added-those of Bitolj, Skoplje and Xanthi-while the former Serb districts near Pirot and Tsaribrod were incorporated into the province of Sofia. Thus Bulgaria acquired a large additional territory in which the Greek and Serb inhabitants were subjected to systematic persecution. The territory gained from Yugoslavia was estimated at 10,039 sq.mi. with about 1,500,ooo people, and was economically important on account of its tobacco and opium. From Greece, Bulgaria temporarily gained Greek Macedonia with about 9,884 sq.mi. and 1,600,000 inhabitants, and western Thrace with 3,364 sq.mi. and 350,000 inhabitants, both areas containing important silk, tobacco and olive production and a relatively well-developed industry. With this conquest achieved and Macedonia united under Bulgarian rule, parliament amnestied the former Macedonian revolutionaries, among them Ivan Mihailov, the head of the I.M.R.O. After June 1941 German aggression against the soviet union brought forth strong sympathies for the U.S.S.R. and popular feeling remained strong enough to prevent Bulgaria from an open participation in the war against the soviet union. Some of the Bulgarian liberals succeeded in escaping and organized abroad a free Bulgar movement under Kosta Todorov.

The Bulgarian government did, however, declare war on Britain and on the United States of America, and its policy went so far as to suppress all Rotary clubs and Y.M.C.A. organizations and to liquidate their properties. Though the number of Jews in Bulgaria amounted to much less than 1% of the total population, the anti-Semitic legislation closely imitated the national socialist laws and practice. Similarly there were bitter complaints from the Greeks and Serbs in the newly-occupied countries about the harshness and cruelty of the Bulgarians.

At the end of March 1942, King Boris visited Adolf Hitler, who demanded active support by Bulgaria in the Russian campaign. But Bulgaria refused to approve the far-reaching demands of Hitler. As a result the cabinet resigned on April 11. The foreign minister, Ivan Popoff, and the minister of war, General Theodossy Daskaloff, did not join the new cabinet formed by Premier Philoff. The premier became foreign minister, and General Nikolai Mikhov, commander of the army corps of Sofia, became minister of war. The powerful ministry of the interior remained in the hands of Peter Gabrovsky. It was decided to celebrate April 12 of each year—the date of the union of Macedonia and Thrace with Bulgaria—as the day of the unification of Bulgaria.

The strength of the unrest in the country was shown when several leading Bulgarians, among them General Vladimir Zaimoff, former minister of the interior, were executed as "tools of bolshevism." The unrest grew with the loss of German prestige following the successful resistance of the Russians. At the end of March 1943, King Boris again visited Hitler at the latter's field headquarters; they tried to arrive at closer collaboration between the

two countries. The king's return to Bulgaria provoked a crisis, for the Russian successes on the eastern front had strengthened the pro-Russian sentiment of the people. The king found himself forced to assume de facto charge of foreign affairs, while Bogdan Philoff became undersecretary of foreign affairs. In many of the larger towns a state of siege was proclaimed. But all these measures did not bring internal peace. Violent demonstrations were held throughout the country on May 1, in spite of many preventive arrests, and Boris had to leave the capital in haste on the advice of his government. The unrest frequently took the form of the assassination of prominent pro-axis personalities. Among them was Col. Athanas Panteff, former chief of police, whose national funeral services, held on May 4, were followed by widespread rioting with a heavy death toll. Other prominent victims of Bulgarian patriots' terrorism were Sotir Janeff, a close personal friend of the king, president of the foreign affairs commission of the parliament and editor of the semiofficial Slovo, and Gen. Christo Lukoff, a former minister of war, both fervent friends of Germany and extreme Bulgarian nationalists. These assassinations were followed by that of Sapria Klevkoff, a member of parliament and, as it was reported, the 110th Bulgarian political supporter of Germany to die at the hands of terrorists.

King Boris III died on Aug. 28, 1943, in Sofia after four days of suffering of unexplained origin but which was reliably reported to have been caused by a shooting at a small railway station outside the capital, when the king was returning from another of his visits to Hitler. His six-year-old son, Prince Simeon of Tirnovo, ascended the throne under the name of Simeon II. It was generally believed that Hitler had put before the king two urgent demands, one for full powers for the gestapo to repress

Bulgarian unrest and the other for fuller Bulgarian participation in the war. After the death of the king a regency council was appointed, consisting of Prince Cyril, Premier Philoff and Minister of War, Gen. Nikolai Mikhov. The Bulgarian army, irrevocably committed to a pro-German policy, backed the continuation of a determined pronazi policy, in which Minister of the Interior Peter Gabrovsky was the strong man.

Effect of Allied Military Successes.—The war was brought home to the Bulgarian people by heavy raids of U.S. and British bombing planes over Sofia which resulted in a large-scale evacuation of the capital. The heaviest raids occurred on Jan. 10 and March 16, 1944. Many Bulgarians expressed their opposition to the government policy, among them the Democratic party under Nikolai Mushanov with its very strong pro-Allied sympathies, the Pan-Slav Zveno group and the communistinspired Otechestven group to which also the active guerrillas, the Shumatsi, belonged.

The Bulgarian council of regents was determined to follow its German policy, but the victorious Russian advance toward the Danube more than counteracted German pressure. Germany's demand to break off relations with the U.S.S.R. and to throw Bulgaria's army of 500,000 men into the war against the red army was unavailing. By the middle of Aug. 1944, the internal situation had so deteriorated that even Premier Bagrianov was forced to move for peace. On Aug. 17 he declared before the Bulgarian parliament that the majority of the Bulgarian people never wanted to interfere in a large-scale conflict between great powers. On Aug. 22 the foreign minister, Parvan Draganov, was even more outspoken in his speech before parliament, stressing his country's friendly relations with the U.S.S.R. and describing the declaration of war against Britain and the U.S. as a mistake. At the

same time regret was officially expressed for the anti-Semitic legislation. All official German propaganda in Bulgaria was stopped, exports to Germany were cut and political prisoners were released. On Aug. 30 a Bulgarian armistice delegation arrived in Cairo.

A new democratic and pro-Allied government under Constantine Muraviev and the veteran Bulgarian democratic leader Nikolai Mushanov was formed three days later. It immediately liberated political prisoners, disbanded all pro-fascist organizations, broke relations with Germany, denounced the anti-Comintern pact and revoked all anti-Semitic laws. But suddenly, to the general surprise, the new government was faced on Sept. 5 with a Russian declaration of war, which was officially motivated by Bulgaria's refusal to break completely with Germany. The Bulgarian government declared war on Germany on Sept. 8, after having immediately asked an armistice from Russia. The armistice was granted on Sept. 9, and the Russian army under Marshal Fedor Tolbukhin occupied the country. The Bulgarian democratic government was dismissed. The new cabinet, formed with Russian approval, was headed by Kimon Georgiev, who had led the military coup d'état against the democratic government of N. Mushanov in May 1934, and had introduced an antiparliamentarian dictatorship.

The new "Fatherland Front" government had the full backing of soviet Russia and the leftist parties. Many persons, among them the leaders of the pro-German groups, were arrested. Though the cabinet included four communists in key positions and its policy was dominated by Russia, it was emphasized officially that no attempt would be made to introduce communism.

On Oct. 11, 1944, Bulgaria accepted the Allied armistice terms calling for the evacuation within 15 days of all Bulgarian troops and officials from the Greek and Yugoslav territories occupied by Bulgaria in 1941. A joint Allied military mission under the chairmanship of the soviet representative was established in Sofia. Foreign Minister Petko Stainov declared that the Bulgarian people wished to show the whole world, and primarily the Allies, that it was ready to wash away in its own blood (by fighting the Germans) the stain of its former criminal rulers. The armistice was officially signed in Moscow on Oct. 28. Reparations to Greece, Yugoslavia and other United Nations were left for later negotiations. Thus the country was not immediately burdened with heavy reparations such as those of Finland, Rumania and Hungary, though Greece had suffered much from Bulgarian occupa-

Communist Dominance.—The Fatherland Front government continued to strengthen its hold upon the country. Premier Kimon Georgiev, and the minister of war, Damian Veltchev, were members of the Zveno group, which changed its former fascist leanings to a strong Russophile pan-Slavism. The most influential member was the minister of the interior, Anton Yugov, a communist, who had under his control the armed militia which ruled the country. Although the Fatherland (Otechestven) Front represented officially a coalition in which the strongest democratic party in Bulgaria, the Agrarians, was represented, the most important Agrarian leaders protested against the preponderant communist influence and went into opposition. Among them were Georgi M. Dimitrov, who in May 1945 was forced to take refuge in the U.S. legation, and Nikolai Petkov, who resigned from the cabinet.

Special people's courts dealt with enemies of the regime and former collaborators. Several thousands were executed, among them the former regents, Prince Cyril, ex-premier Bogdan D. Philoff and General Nikolai Mikhov. New laws "for the defense of the people's authority" threatened the most drastic punishment for any active opposition to the Fatherland Front government. Elections were first slated for Aug. 26, 1945, but they were postponed at the last minute as the result of protests of the U.S. against the "undemocratic" procedure. The Russian press protested against this "interference" in Bulgaria's affairs.

The postponed elections were held on Nov. 18, 1945. The voters had only one list presented to them, the official list of the Fatherland Front government candidates; no opposition lists were presented. The official single list comprised 94 Communists, 94 Agrarians, 46 Zvenoists, 32 Social Democrats and 11 Radicals, in each case representing only that group which was collaborating in the government, not the opposition. Foreign Minister P. Stainov proclaimed the election results a confirmation of the Fatherland Front's attachment to Russia—"our liberator"—and to Marshal Tito's Yugoslav regime.

George Dimitrov, the communist leader and ex-president of the comintern, the most influential man in Bulgaria, denied that there was any question of a soviet Bulgaria, and even deplored the excesses committed by the government (the number of executed "war criminals" surpassed by far the 3,000 officially sentenced by the people's court, and the wives and children of "war criminals" were long kept in internment), but the promises to broaden the government and to include democratic representatives were not kept. Members of the opposition continued to be regarded as "traitors." Formerly violently antibolshevist groups, like the war minister Veltchev's Military league, became fervent pan-Slavs. Their pro-Russian attitude was partly based on hostility to Greece and Turkey and expansionist intentions against these countries, supposed to be in the "British camp."

The Moscow conference of the Big Three at the end of 1945 decided that Russia should advise Bulgaria to include in the government representatives of at least two democratic groups. The procedure in this case was different from that adopted in the case of Rumania, where representatives of all the three powers were to consult with the king about the broadening of the government. The most important democratic forces in Bulgaria were the Agrarians, headed by Nicholai Petkov, son of the great national liberal leader and brother of the prominent Agrarian Petko Petkov, who was assassinated; the Socialists under Kosta Lulchev and Kristo Pastukhov; finally the veteran democrat Nicholai Mushanov, who, probably with the Agrarian leader George Dimitrov (not to be confused with the communist leader of the same name), were the most popular Bulgarian leaders.

Premier Georgiev went to Moscow on Jan. 7, 1946, to consult with the Russian government, after negotiations with the opposition had broken down. The opposition had demanded guarantees for the liberties of Bulgarian citizens, freedom of the army from all party influences, and the holding of new general elections as soon as possible. Soviet Vice-Commissar Vishinsky visited Sofia, but the opposition leaders held fast to their demand for liberty in spite of Vishinsky's threats that "history will pass by such people and will follow its course." The Bulgarian situation reached a complete deadlock, and thus the Moscow agreement could be considered as a full diplomatic victory for the soviet union and the Russian-appointed Bulgarian government.

On Feb. 22, 1946, the U.S. government sent a memo-

Bulgarian peasant girls in native costume carried sheaves of wheat as they paraded through Sofia on May day, 1946

randum urging the Bulgarian government to find a mutually acceptable basis for inclusion of two truly representative members of the opposition parties in the cabinet. This demand by the U.S. was officially and sharply rebuked by the soviet government, which also charged that the U.S. political representative to Bulgaria, Maynard B. Barnes, was systematically encouraging the oppositional parties in that country. On March 11 U.S. Secretary of State Byrnes flatly rejected the soviet charges and expressed his surprise that the Russian government had taken exception to his expectation that the opposition leaders should enter the government on terms satisfactory to the opposition as well as the government. He regarded this expectation as "the very essence" of the Moscow pact, and a "fundamental and simple proposition." But the efforts of the U.S. were of no avail. On March 31 Bulgaria announced the formation of a new cabinet without including any opposition members, because "the soviet union considered the terms presented by the opposition for participation in the government . . . unacceptable." There were few new members in the cabinet. One of them was Deputy Premier Kostov, a communist who held also the portfolio for electrification.

The course of the new government was even more outspokenly extremist than before. On April 19 the minister of justice introduced a bill in the assembly providing for the suppression of newspapers and periodicals deemed guilty of the systematic publication of material prejudicial to the interests of the state or its relations with foreign powers. When the opposition leaders addressed a memorandum to the Allied Control commission in Sofia, submitting grievances, the government attacked the opposition "seeking foreign intervention in the internal affairs of the country," organized spontaneous mass meetings throughout the country and filled them as well as its press with gravest warnings to the opposition. The political trial against George M. Dimitrov, famous Bulgarian Agrarian leader and 17 of his followers for infringement of the state security laws began on May 29, and on June 7 a similar trial was staged against Kristo Pastukhov, the

Social Democrat leader who had been under arrest for several months.

As time went on, communist pressure upon the government became ever stronger; it was now intended to transform the coalition regime under communist leadership into an openly communist administration. The army was purged and Gen. Veltchev forced to resign as minister of war. On Sept. 8, 1946, the monarchy was abolished in a plebiscite and a people's republic created. Until the elaboration of a new constitution, the president of the Bulgarian parliament or *Sobranye*, Vasil Kolarov, a communist, was taking over the prerogatives of the crown.

On Sept. 24, 1946, Secy. Byrnes on behalf of the U.S. government demanded in a letter to the Bulgarian prime minister, the fulfilment of the agreement regarding freedom of press, radio and assembly for the opposition, noninterference of the militia with candidates or voters, release of political prisoners or open formulation of charges against them, and elimination of any possible threat of post-election retaliation for political reasons. The Bulgarian government, backed by the Russian government, rejected all these proposals for the freedom of elections as an interference with Bulgarian sovereignty.

The elections to the constituent assembly were held on Oct. 27, 1946. Of a total electorate of 4,558,332 no less than 4,244,337 voted. The government Fatherland Front received 2,983,803 votes and 364 seats. Of these votes 2,265,105 went for the Communists who received 277 seats and became the strongest party in the assembly with an absolute majority over all government and opposition parties put together. The opposition parties, Agrarians and Social Democrats, received 1,208,882 votes, the small opposition party of the Democrats received 22,755 votes. As a result a communist, Vasil Kolarov, was elected president of the assembly with 304 against 71 votes. On Nov. 21 prime minister Kimon Georgiev and his cabinet resigned and the veteran communist leader George Dimitrov formed a new government.

Burma

Burma, a British dependency, is a long narrow strip of land, mostly tropical, lying between lat. 9° and 28° and long. 92° and 101°, on the western edge of the Indo-Chinese subcontinent. Burma is bounded on the north by Tibet, the east by China, French Indo-China and Siam (Thailand), and on the northwest by Bengal and Assam. Area, 261,600 sq.mi.; the pop. in 1941 was 16,823,798. Rangoon (pop. 1941, 501,291) on the Hlaing river, a nodal point in internal communications with good waterways to the Irrawaddy and good land connections north and south, is at once the biggest seaport, the largest trading centre and the capital city. Other main ports are Moulmein (pop. 1931, 65,506), Bassein (pop. 1941, about 50,000) and Akyab (pop. 1931, 38,094). These, with Mandalay, the old capital of Upper Burma (pop. 1941, 163,537), are the only towns with more than 30,000 people.

Racially. the peoples of Burma are Mongoloid. About 90% are Buddhist by religion, and about 70% use the Burmese language. The largest indigenous minorities are: (1) the Karens, who live in the southeastern hills, but have large colonies all over Lower Burma; in 1931 they num-

bered 1,367,673, of whom more than 1,000,000 were Buddhists and 218,790 Christians; (2) the Shans, who spread in gradually thinning numbers from the Shan States in the east and southeast toward the west and north; in 1931 they numbered 1,057,406; (3) the Chin-Kachin group in the horseshoe of hills round the north who include also Nagas and some other tribes, totalling by 1946 about 750,000.

The largest immigrant minority was the Indian population numbering 1,017,825 in 1931, divided equally between Moslems and Hindus, with a sprinkling of Sikhs, Christians and others. The Chinese in 1931 numbered 193,594, but by 1942 may well have doubled in numbers. Europeans, Anglo-Burmans, etc. (including the British regiments), totalled 30,851. Japanese at no time exceeded a few hundreds. Governors during the decade 1937–46: Sir Archibald Cochrane 1936–41; Sir Reginald Dorman-Smith 1941–46; Sir Hubert Rance thereafter. Premiers: Dr. Ba Maw 1937–39; U Pu 1939–40; U Saw 1940–42; Sir Paw Tun 1942 (Jan. to evacuation).

Separation from India.-As a province of India, Burma, from Dec. 1922, had shared in the "Montford" scheme of dyarchy. By the Government of Burma act, 1935, passed by parliament in London, which came into force on April 1, 1937, it was separated from India and endowed with a new constitution, having a ministry and a bicameral legislature, a house of representatives with 132 members elected on a wide franchise and a senate of 36, half elected by the lower house and half nominated by the governor. Effective power vested in the lower house, the functions of the senate being circumscribed. The authority of the ministers covered a wide field, the only major reservations being defense, foreign affairs and control of currency. The state railways were managed by a board of experts and nonofficials. In their own sphere, the ministers were responsible to the legislature, the governor being bound by his instrument of instructions to accept their advice on all normal occasions. The "reserved" subjects were administered by nominated counsellors, but joint consultation between them and the ministers was, under his instrument of instructions, to be encouraged by the governor. This was given practical effect in the defense sphere by the establishment in 1939 of a joint defense council, which assumed considerable importance in the 1942 campaign. The act also provided for the appointment by the governor of a financial adviser. Finance, however, was in general under the finance minister, who presented estimates to the lower house. Estimates for reserved departments, though not votable, were discussed in both houses. The premier and his colleagues acted as a cabinet, and the doctrine of joint responsibility was adopted. Except on rare occasions, the governor did not attend cabinet meetings, which were normally presided over by the premier.

The act also contained safeguards against discrimination for minorities, for certain classes of government servants, and certain non-Burmese commercial interests. Separate administration for the Shan States and the hill tracts was provided.

Internal Politics, 1937–42.—A general election in Dec. 1936 preceded the new constitution. It produced a somewhat fragmentary house containing no fewer than seven parties and six groups with the "no party" label. U Ba Pe, leader of the United party (46 members) was unable to form a ministry, and Dr. Ba Maw, leader of the Sinyetha (Poor Man's) party of 14 members formed a coalition, principally with the minorities, and took office as first

premier of Burma. All parties, with the exception of the three Thakin (Master) party members, showed a genuine, if fluctuating, desire to work the new constitution and raise the status of Burma. All had much the same aims, and divisions among them were based on personal loyalties rather than policy. Ba Maw's program was one of rural land reform, increased social services, retrenchment, reduction of taxes and full self-government or independence for Burma. His first measure was the abolition by stages of capitation tax in Lower and Thathameda (Household) tax in Upper Burma. This relieved the labouring classes of all direct taxation, but cut the revenue by some 6%. A new source of revenue was found in state lotteries, and these made up part of the loss. Measures to regulate rural tenancies and the holding of land were put in train, and a committee known as the fiscal committee was appointed to examine government revenue and expenditure. The Tenancy act and other ameliorative measures fructified under Ba Maw's successors, and promised well for the future when interrupted by the Japanese invasion. The fiscal committee's report was adopted by a later ministry but had not been put fully into effect before the evacuation. Some of its recommendations were controversial; others lost validity in the postwar economy.

In the summer of 1938, however, progress was interrupted by anti-Moslem riots which broke out in Rangoon over a trivial cause and spread, sedulously fanned by propaganda, over most of the country. The disturbances lasted for many months and caused heavy loss of life and property. During the same period there was a growth of general unrest, manifesting itself in labour troubles and school strikes. These were for the most part inspired and led by the Thakins. Their creed was advanced socialism or communism coupled with an exclusive nationalism, but their program was vague and as yet their influence was small.

Its failure to maintain order cost Ba Maw's ministry the support of the minorities. In Feb. 1939 it fell, and was succeeded by a United party ministry under U Pu. A new competitor, however, had appeared. In 1938, U Saw founded the Myochit (Patriot) party, while still remaining a member of the U Pu ministry. In Sept. 1940 he broke away, and thereby caused U Pu to be defeated in the house. U Saw then took office as premier, an office he continued to hold till Jan. 1942.

The outbreak of war in 1939 had little effect on Burma, which looked forward as in 1914 to an increasing demand at rising prices for its products. In Feb. 1940 the house of representatives passed a resolution condemning German aggression, but making support for the war effort conditional on the grant of dominion status. In practice there was no refusal of co-operation: Burma's contribution at this stage was merely to increase the supply of its products, to which good prices were adequate encouragement. Defense, a "reserved" subject, seemed at first to have little bearing on the European military situation to which apparently Burma could best contribute by moderating its own demands for instructors and equipment. Other issues absorbed the public interest, two of which drew sharp attention to the new status of Burma in international affairs.

Relations with India.—For some years, particularly since the riots of 1938-39, Indo-Burma relations had been a constant source of worry to both governments. Protracted discussions finally led to the arrival in Rangoon at the end of 1941 of a representative of the government of India to negotiate an immigration agreement. An agreement was reached with U Saw's ministry but was so unfavourably received by the press and public in India that it was never ratified. Feeling ran high in both countries, and nothing more could be done before the evacuation. Discussions were resumed by the exiled government of Burma in India and a fresh agreement was drafted in 1945. This was not too well received by the public in India, and when laid before the governor's council in Rangoon was seen to be unacceptable in Burma. Ad hoc arrangements were made for the return of certain classes of evacuee, but otherwise no progress was recorded.

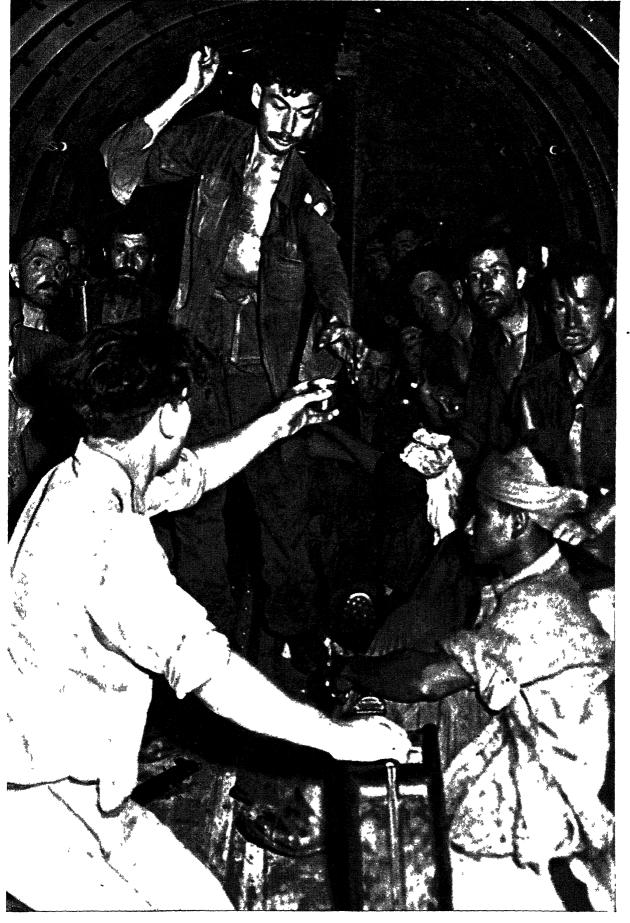

Opening of the Burma Road.—The other important factor was the opening of the road to China. Many elements in Burma had opposed it as likely to lead to a Japanese air attack on Rangoon, while opening the door to an influx of Chinese immigrants. The Chinese government, however, was anxious, and the British and United States governments were solicitous. By 1938 the road was built, and soon from Rangoon to Lashio the towns were thronged with Chinese contractors and traders, officials and nonofficials, buying stores and transport for China. The negotiations on Indian immigration had attracted the attention of the Chinese government, which made known its desire to negotiate an agreement, and appointed a delegation, of which the head was given the rank of ambassador, to proceed to Rangoon for discussions. To facilitate negotiations, the Burmese representatives were appointed by the secretary of state to be his agents, which gave them much wider powers. The discussions, however, came to nothing. After one meeting they were suspended till U Saw should return from the United Kingdom, and the Chinese delegates for their part could receive further instructions. The course of the war with Japan prevented the negotiations from being resumed, but its relations with China remained an important factor in Burma's foreign policy.

Threat of War.—Meanwhile, in 1940, the fall of France had brought the Japanese menace much closer, and attack seemed imminent. Contrary to expectation it did not come, though at one point it was staved off only by closing the road to China. Recruitment for the army was pressed on, and small volunteer naval and air forces were established. Conscription was introduced for Europeans and the courses founded for them were thrown open to Burmese volunteers. Civil defense measures were started and arrangements drafted to put the country on a war footing. With scarcely an exception, all parties, creeds and races united in preparing for war.

U Saw, however, had not given up the idea of dominion status, and in 1941 he went to London to make a personal appeal. But the time was unfortunate; the British government had too many other things on its mind to give close attention to Burma's problems, which seemed remote from the war, and his mission was abortive.

U Saw did not return. While he was on his way back, the Japanese attack began, and on his journey he was arrested and interned by the British government for contacting the Japanese. He was released only after the war and returned to Burma early in 1946. His arrest caused hardly a ripple on the surface of Burmese politics. He was succeeded by Sir Paw Tun, who remained in office till the evacuation, when he proceeded to India as one

Wounded and suffering from thirst and dysentery, raiders of a British jungle penetration force are shown inside an R.A.F. rescue plane which picked them up behind Japanese lines in northern Burma in April 1943, and returned them to safety

hold the portfolio of home affairs in the governor's council.

Japanese Invasion.—On Dec. 9, 1941, the Japanese occu-

pied Victoria Point unopposed. The main attack, however, did not open till Dec. 23 and 25, when there were heavy air raids of considerable accuracy on Rangoon. A land invasion from Siam threatened Moulmein and Tavoy. The defenders were unable to hold the Japanese advance, and then began that fighting retreat that ended only in May 1942, when the army finally withdrew to India, hampered at every move by the presence on the routes of thousands of refugees. The campaign was marked by much heroism among both soldiers and civilians on that long march. In the air, the force of the Japanese air attack on Rangoon was broken by the spectacular gallantry of the U.S. air volunteer guard (sent by Generalissimo Chiang Kai-shek) and the devotion of the R.A.F. fighters. For the first time also, Chinese land forces, under a U.S. army commander, fought side by side with the British against a common foe.

The regular campaign was soon over, but in the hills the Japanese could never establish themselves, and resistance went on, persistently and successfully, till the reoccupation in 1945.

In May 1942 the government of Burma went into exile in India, where it spent the next three years in planning against the day of return. Thus for the time being ended a great experiment in constitutional development.

Burma under the Japanese.—It was the policy of the Japanese to make Burma into a puppet state in subordinate alliance with Japan, and for this they required an instrument. Some 30 young Thakins, of whom Aung San was the most important, had left Burma secretly in 1941 and contacted the Japanese, with whom they returned at the time of the invasion, acting as guides, interpreters, etc. The initial successes of the Japanese encouraged many to join them; some 3,000 irregulars assisted the Japanese in the fighting. As each district was occupied, the Thakins endeavoured to set up an administration, but their incapacity and the excesses of their followers embarrassed the Japanese and alienated their own people.

Presently the Japanese found it necessary to disband their forces and reform them under closer discipline with Thakin Aung San as major general in command, under the title Burma National army. In the political sphere, Ba Maw, who had been convicted and imprisoned for sedition in 1941 but escaped in the confusion of the evacuation, put himself forward as head of the state, and was gratefully accepted by the Japanese. He recalled government servants to their posts, and restored some semblance of administration. With the agreement of the Japanese, he invited a number of ex-ministers and other public men to join an independence preparatory commission to draft a new constitution.

The climax came when on Aug. 1, 1943, Burma was formally declared independent with much pomp and circumstance, and the new constitution (which bore many resemblances to the old one) was introduced. On the same day, Ba Maw declared war on the Allies, a declaration which was put into effect in varying degrees by the members of his administration. Simultaneously, he signed a pact of alliance with Japan. Envoys were sent to Japan and other countries in the "co-prosperity sphere" and there was much coming and going between Rangoon and Tokyo. Japanese became the second language of the country, and students and officer cadets were taken to Japan for training. Many of these were the sons of prominent men and were as much hostages as pupils. The declaration of independence had a profound effect on the country, and brought many waverers over to the side of the Japanese.

Disillusion; Welcome to Allies.—Burma, however, was cut off from world markets, and Japan could neither buy its surplus produce nor supply its needs. Shortage of supplies and transport, and a new and plentiful paper currency fostered inflation. Black markets and other rackets flourished, but genuine credit almost dried up altogether. Much land went out of cultivation, and except for the lucky speculators the country sank into sullen apathy. The Japanese army of occupation paid scant

attention to the Burmese government's officials, and labourers, draught-animals and supplies were arbitrarily seized and carried off at the will of military commanders. Ba Maw, who had amalgamated the Thakin party with his own, fulfilled the dual role of party chief and head of the state. More and more, he and his family began to assume semi-royal prerogatives. Disillusion set in, and life dragged on in this uneasy atmosphere until in 1945 the Allies swept down to Rangoon. The Japanese, thrown back in confusion everywhere in the far east, could resist no longer. The victory was complete, but the cost to the country was enormous. Ba Maw fled with the Japanese and ultimately gave himself up in Tokyo in Jan. 1946. He was permitted to return to Burma in August. Not only its physical assets, but also its whole social and economic life had been destroyed. Yet there was no country where a warmer welcome was extended to the advancing Allies.

Reconstruction.—This situation presented the British government with a problem. Help immediately, and continued assistance for some years would be needed to set Burma on its feet again. Moreover, a solution had to be planned in advance, before Burmese opinion could be consulted. The plan adopted was published in a White Paper in May 1945. It provided for three stages: (1) A period of direct rule by the governor with a nominated council and legislature; (2) A return to the 1935 act once a new franchise could be settled and an election held; (3) Complete self-government within the commonwealth.

An early advance to stage (2) was foreshadowed when in July 1946 the Burma Legislature act became law. This

granted the franchise to all men and women over 21, lowered the ages for membership off the upper and lower houses to 30 and 21, and abolished the property qualification for senators. The first election was envisaged for the spring of 1947. Advance to stage (3) "at the earliest practicable moment" was forecast in the governor's inaugural address in Sept. 1946.

For five and a half months after the occupation of Rangoon, the military administration had continued in charge of affairs but on Oct. 16 the governor resumed control. Political discussions were begun at once, but the political climate had changed. The first raptures of liberation from the Japanese had passed and party leaders had begun to consider their future. The Thakin party, as it had been the first to welcome the Japanese, had also been the first to see through them, and the Burma national army had been in touch with the British forces for some time before it joined them

openly in March-April 1945. It was the first purely Burmese force to take the field after the days of the Burmese kings, and Major General Aung San became a national hero. This gave the party great ascendancy, and its first aim was to form a national front under the title Anti-Fascist People's Freedom league, in which it would be the dominant partner. All parties had accepted the White Paper in principle, but discussions with the A.F.P.F.L. on participation in the governor's reconstruction administration broke down as they claimed too dominant a share. They then withdrew from the discussions, and the governor formed a council of 11, of whom 10 were Burmese who either had not joined the A.F.P.F.L. or withdrew from it. A little later, the A.F.P.F.L. was invited to co-operate in the legislature, but these discussions also failed. In the summer of 1946, U Saw's Myochit party revived, and its leader forced the resignation of two of its three representatives on the governor's council. Desultory discussions continued for the reconstitution of the council, and in September the advent of a new governor gave the required opportunity for a fresh start. The time in other respects was not auspicious, as the Rangoon city police had just gone on strike for increased allowances, and the police elsewhere and some other government servants began to follow their example, with the open support of the A.F.P.F.L. After tedious negotiations, the governor's council was reformed, with A.F.P.F.L. holding most of the portfolios, and its leader U Aung San as a counsellor to the governor, and vice-president of the execu-

tive council. The new council was given wider powers than its predecessor, and entered on its duties at the end of September, its first task being to try to put an end to the strike. On the military side, an agreement made by Admiral Mountbatten with the A.F.P.F.L. at Kandy in Sept. 1945 provided for incorporating the Burma national army (now styled the Patriot Burmese forces) in the Burma land forces. Thakin Aung San preferred to revert to civil life, and his second in command took his place on the staff of the Burma command.

In the economic field, the governor ordered special measures to encourage the cultivation of rice, which had fallen to some 50%-60% of prewar figures, and these added some 2,000,000 ac. to the area plowed in 1946. Rail, road and river transport, power plant and consumer goods were ordered in pursuance of the plans made in India. For each major industry there was formed a board of experts, officials and members of the public, to operate as government agents with funds supplied in part by the British treasury and in part by the concerned interests.

The social services were re-established by the military administration and in 1946 were being expanded as funds and staff became available. Many students were sent abroad for training after the liberation.

The cost of all these measures greatly exceeded Burma's resources, and the British government put at its disposal some £87,500,000, on terms to be settled later.

Separate Position of Hill Areas.—The hill areas presented a problem entirely different from that of the rest of Burma. Chins, Kachins and Karens showed inveterate hostility to the Japanese and their satellites, and suffered, often at the hands of the latter, for their loyalty to the Allied cause. Feeling in some areas ran high after liberation, and there was even talk of complete secession, particularly among a section of the Karens, who sent a deputation to London on the subject in the summer of 1946.

For the hill peoples in general, however, including the Shan states, who live in the non-Burmese areas excluded from the scope of the elected government, a separate program was inaugurated to help them rise culturally and politically nearer the level of the Burmese; when they had reached that level, they could, if they so desired, join up with one another and with self-governing Burma in the plains. The hills and the plains, economically interdependent, sooner or later were likely to form one political whole. (See also Japan; World War II.)

Burton, Harold Hitz

Burton (1888—), U.S. jurist, was born in Jamaica Plain, Mass., June 22, 1888. Graduated from Bowdoin college, Brunswick, Me., 1909, and from Harvard university law school (1912), he practised law in Cleveland, O. He joined the U.S. army in World War I, serving on the western front. On returning to civilian life, he resumed his practice; he also served as an instructor in corporation law at Western Reserve university law school. In 1929, he was elected to Ohio's house of representatives and concurrently served as director of law for the city of Cleveland (1929—

32). Running as an Independent Republican candidate, Burton was elected mayor of Cleveland in 1935 by a large majority. Five years later (1940) he was elected U.S. senator for Ohio on the Republican ticket. In March 1943 Sen. Burton, together with Senators Joseph H. Ball, Carl A. Hatch and Lister Hill, sponsored the famous "B2-H2" resolution, which called for U.S. leadership and participation in forming a world organization of nations. At the same time, Burton urged elimination of the senate's two-thirds majority rule required for treaty approval. In the senate, Burton generally endorsed the Roosevelt administration's foreign policy but followed, with few deviations, the Republican program on domestic issues. On Sept. 18, 1945, Pres. Truman named Burton as an associate justice of the U.S. supreme court.

Bush, Vannevar

Bush (1890-), U.S. scientist, was born March 11, 1890, at Everett, Mass. He received his doctorate in engineering at Massachusetts Institute of Technology and Harvard in 1916. In World War I, he conducted research on behalf of the U.S. navy in submarine detection. Associate professor and later professor at M.I.T., he was vice-president and dean of engineering at that school, 1932-38. In 1939 he was named president of the Carnegie Institution of Washington. While at M.I.T., he built the famous mathematical robot, later used by the U.S. army to solve gunnery problems. In June 1940 President Roosevelt named Bush chairman of the National Defense Research committee, a scientific research group charged with coordinating all experimental investigation to speed up national defense. In June 1941 President Roosevelt created the new Office of Scientific Research and Development with Bush as its director. In Aug. 1943 in order to expedite development of the atomic bomb, Bush was named to a combined policy committee that included Canadian and British government officials as well as U.S. members.

On Jan. 7, 1946, Secretary of State James Byrnes named Bush to a special five-man committee to study what controls and safeguards would be required to protect the U.S. from atomic warfare. He was named chairman July 3, 1946, of the Joint Research and Development board, set up by the war and navy departments to carry out a unified research and development program for national defense.

Business Review

The period from 1937-46 in the United States may be divided roughly into four phases: peace, defense, war, reconversion. The dividing point between these phases is difficult to determine, as one overlapped the other to some extent in every case. Germany invaded Poland in Sept. 1939; it was a short time after that when the reality of war struck home to the people of the U.S. and when business began to feel its effects. For the sake of convenience, the dividing point between peace and defense can be placed at the end of the year 1939. The defense period may be said to have ended Dec. 7, 1941, with the attack on Pearl Harbor. Hence, the year 1941 must be considered a defense year as far as the economy of the U.S. is concerned. The reconversion phase started in a small way about the middle of 1944, when confidence was widespread that Germany would collapse at any time and that Japan, though it might hold out a long time, would not constitute a serious drain on the economy. During the rest of

1944, however, the public became convinced that the war was not yet won, and that it was necessary to continue the war spirit until it was really over. Germany gave up in May of 1945 and Japan in August; reconversion made a start on V-E day and was given the "all clear" on V-J day.

The Four Phases.—Thus the four periods of the economy of the U.S. during the decade 1937–46 are blocked out: 1937–39, peace; 1940–41, defense; 1942 to the middle of 1945, war; after mid-1945, reconversion.

Peace, 1937-39.—During the peace phase of the decade the attention of U.S. business men was focussed on three major items: the New Deal policies of the federal government, the depression of 1938 and the prospects of war in Europe.

The New Deal in its most revolutionary phases had passed, the National Industrial Recovery act had been declared unconstitutional, and with its passing went the elaborate machinery of its operations. Many of the more conservative of the New Deal measures withstood the test of constitutionality and by 1937 were accepted by business as part of the economic order. Such things as Social Security and the Securities Exchange commission were not only generally accepted but believed to be wholesome additions to the economic structure. At least those who had previously assailed them most vigorously had, by now, grown weary of complaining.

Relations between business and government were nevertheless not happy. There was a mutual feeling of distrust which was heightened by Pres. Roosevelt's plan to "pack" the U.S. supreme court in the early part of 1937. Business lived in fear of the government, but the government insisted that business did not do so. The government published figures of 50 "representative" manufacturers showing their inventories higher than in 1929. This, the government contended, was proof that business did not live in fear. Business economists, however, generally held that 1937 was not a year characterized by large inventories. It was'in 1937 that the first undistributed profits tax was paid. This tax was widely criticized on the grounds that (1) it would induce business to pay out the profits and borrow to finance its expansion instead of expanding by the timehonoured method of retaining earnings and (2) a loss in one year could not be recouped in a good year without paying a penalty—a particularly stiff penalty on those companies with extreme business cycles as compared to those with a greater stability throughout the cycle.

The electric power industry had two worries peculiarly its own. One was the fear of government competition. The Tennessee Valley authority was coming into full operation, and the utility companies feared that the plan might be carried to other regions. There was also uneasiness caused by the Public Utility Holding Company act, which contained the "death sentence" on the large and complicated public utility holding company financial structures.

Business was also harassed by labour during this period. It was in the first part of 1937 that the sit-down strike started in the General Motors plants. By this method, labour forced the company to commit the first act of violence. Court injunctions were granted enjoining labour from occupying the plant on the principle of private property rights, but the injunctions were ignored. It was in the same year that the big steel and the west coast shipping strikes occurred. In 1938 the Fair Labor Standards act was passed, setting maximum hours, and minimum wages, prohibiting child labour and forcing employers to bargain collectively with the recognized labour union of the plant.

The Agricultural Adjustment Act of 1938 was designed

to aid the farmers through a soil conservation program, loans, marketing quotas, parity payments, marketing agreements, crop insurance and diversion of surpluses. At this time the farmers found themselves in a sorry plight. Their income was 13% lower than in 1937, and the prices of farm products fell on the slightest provocation. On the other hand, the prices of the manufactured products which they bought were held firm by the ability of manufacturers to control supplies. There were but three immediate possibilities of relief open to the farmer: lower prices on manufactured goods, devaluation of the dollar and a boost in farm prices through the new Agricultural Adjustment act and other crop controls.

The Guaranty Survey in its summary of 1937 listed three major economic problems that called for solution. One was the development of a long-range plan for relief expenditures in time of stress. The second was the fiscal problem including a balanced budget, a broadened tax base and a reduction in the federal debt. The third was the necessity for some new approach to industrial problems that would enable government, business men and labour to consider their differences in a spirit of co-operation. These same problems remained as the fundamental economic problems until they were replaced by those of a war economy about 1940.

The seasonally adjusted index of industrial production prepared by the Federal Reserve board stood at 116 in Jan. of 1937. It rose slightly during the spring and summer, but by September it had slipped back from the 120 in July to 115. From this point it fell rapidly to 107 in October, 96 in November, 87 in December and then edged down to 81 in May and June of 1938. It then began a slow uphill climb, reaching 101 in Dec. 1938. After a slight dip in the spring it rose to 106 in August. With Hitler's march into Poland it advanced rapidly and reached 124 by the end of the year.

The stock market declined in Aug. 1937, but this was regarded as a healthy sign after the long upswing. There was no sign that the long postponed consumption needs of the nation had been met. The decline in business activity consequently was considered merely a readjustment. By the end of 1937, however, unemployment was increasing by leaps and bounds. Pres. Roosevelt, in his opening message to a special session of congress, recognized the seriousness of the situation and emphasized the need for encouraging private enterprise and for a balanced budget. The commentators at the year's end predicted a gloomy future and had many suggestions as to the cause of the depression. As pointed out above, some said it was caused by overconfidence and excess inventories. Others pointed to the lack of confidence caused by the labour situation. Still others attributed the lack of confidence to the element of uncertainty created by the enormous spending of public funds. Whatever the cause, the revival did not start until July 1938. After that, it was a long, slow climb, and business did not reach the level at which it started in 1937 until after Hitler invaded Poland.

Before the depression of 1938 had reached its nadir, the strained international situation and the vague fears of war felt in 1937, had turned into real apprehension. It was in March 1938 that Hitler's war-of-nerves on Austria reached its climax with the *Anschluss*. That was followed by the "Munich pact" of Sept. 1938, which was presumed to have brought peace; but in December it was announced that the U.S. government was considering a huge preparedness program. War scares in March, April and Aug. 1939 were

followed by Hitler's march into Poland in September. The short Polish campaign was followed by a lull in military activities in Europe, and a number of peace gestures were made by Hitler. By the end of 1939, people everywhere were lulling themselves into tranquility by the false belief that the war was about over, that it was a "phony war." Military preparations in the U.S. seemed to reflect this attitude.

Defense, 1940-41.—The transition from peace to defense was a gradual one, from a rather uneven start. With Hitler's march into Poland in Sept. 1939 business men began furiously to prepare for large war orders by buying materials from one another, each hoping to have an adequate inventory when the orders came in. This additional demand spurred production, and by the end of 1939 the Federal Reserve Index of Industrial Production was at 124. But the anticipated war orders did not materialize, and the export business did not grow as expected. By March the index of industrial production had slipped back to 114. This was in the period of the so-called "phony" war when Hitler was proclaiming his desire for peace. In April 1940 his forces marched into Denmark and Norway. Immediately, the index of industrial production began to rise. By July 1 France had fallen, the war orders were pouring in and the index was up to 130. By the end of 1940 it had climbed to 140 and by the end of 1942 it was at 176. This rise was interrupted only by the soft coal strike in April 1941 when the index dropped back three points instead of forging ahead at its usual rate of three or four points per month. By May, however, it was back on the trend line after having risen 11 points from April, but this by no means made up for the production lost in that one month.

Business became active with war orders, but the activity was spotty, as most of the orders were given to the large, well-known suppliers. Those giving the orders were a bit fearful of their own reputations; if they gave to a small supplier and he failed to fulfil the contract, the officer who placed the order might very well be subject to criticism, but if a large supplier was not able to make good on his contract, the officer would hardly be accused of inefficiency. As a result, large suppliers were booked to capacity and often choked with more orders than they could handle. On the other hand, the small units in the industry were frequently looking for work. Many of them were engaged in absorbing the civilian customers of the large producers, but it took time to build up the channels of distribution. Business men remembered their situation during and after World War I and were fearful of again being labelled "war mongers" and "profiteers." They might have refused to take these war orders, as the U.S. was not yet at war, but they did not. Instead, business took practically all the orders it could handle and turned out the goods at what were generally considered at the time to have been fair

The aircraft industry was young and not geared for volume production. The big companies, such as General Motors and Ford, which did understand volume production, were not trained in the manufacture of aircraft and did not have the facilities for production. Some of them even started tooling up for production on their own money before the contracts were ready. In other industries much the same was true. For example, Republic Steel started an expansion program with the company's own money before it had received any great volume of military orders. Later its president turned to Consolidated

Vultee Aircraft and helped that company become a large volume producer. In this stage of war production, much of the effort had to be devoted to building the factories, producing the machine tools, building an efficient operating organization and locating sources of supply. The machine-tool industry proved to be one of the major bottle-necks.

The steel industry was caught in an unhappy predicament in 1940. At the first of the year business had been at low ebb, and the supplies of ore that had been brought to the mills during the Great Lakes shipping season proved to be inadequate. As a result the industry was caught with short ore supplies during the following winter. When the plants were built and ready to begin turning out the actual combat materials about the end of 1941, the shortages of materials became critical.

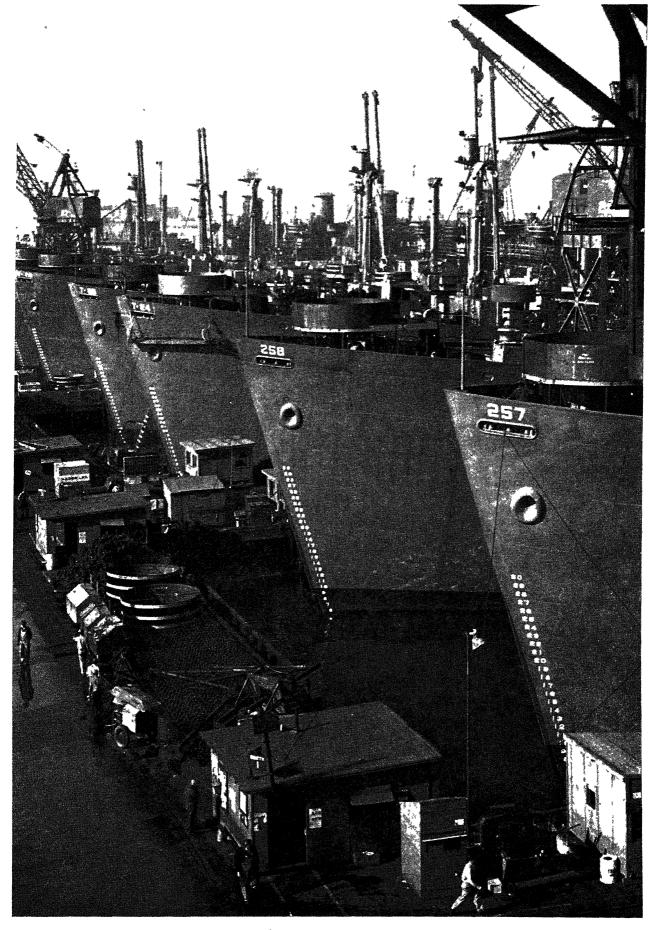

The railroads had been having a hard time after 1929, and had not been purchasing much new equipment; as a consequence, the equipment makers turned their spare capacity to the production of heavy tanks and other such military equipment. By the time the railroads felt the pinch and needed new equipment, they were unable to get it in adequate volume. Nevertheless, through efficient handling of equipment—shorter loading and unloading time, the use of more freight trains, car pooling—the railroads were able to care for all wartime demands.

With this large defense program on their hands, business men ceased arguing about New Dealism, forgot the depressions of 1932 and 1938, and pitched in to the job of production. Nevertheless, they did not feel secure. The shift of business control away from business to the federal government gave cause for concern. Though the government was not actually dictating policies it was in control by virtue of being practically the sole customer of many businesses. In others it was dictating what materials might be purchased and how they might be used. Pres. Roosevelt's statement that he "would speed all aid to Britain by eliminating the silly-fool dollar sign from the transaction" also gave cause for concern. The Lend-Lease act in 1941 and the all-aid-short-of-war policy frightened many who had hoped that somehow the U.S. might escape actual participation.

During this period business achieved none of the objectives it had hoped to achieve. Taxes were raised instead of lowered. Government spending increased. Interest rates were low. The government regulation of "don't's" turned into the positive control of "do's." All of this made business cautious. It took the war contracts at what it considered a fair price, but it was careful to see that the prices were adequate. Profits, instead of being distributed in dividends, were used to buy additional plants and to retire debt. Business men lost confidence, and business plunged to levels not known since 1935. The Dow-Jones average of 30 industrial stocks stood at 155.92 in Sept. 1939, started down in November and continued to decline, with some interruption in late 1940, to the end of this defense period when, for the month of Dec. 1941 the average daily figure was 111.

During the early part of the defense period there were many unusual factors. Unemployment ceased to be considered a serious problem. In fact, many industries were handicapped by a shortage of labour. Yet there remained 8,000,000 unemployed and the Work Projects administration and other relief rolls had not been cleaned out. The

Line-up of Liberty cargo ships completed at a California shipyard in 1943. Shipbuilding and aircraft production accounted in large measure for phenomenal business expansion on the U.S. Pacific coast during the decade 1937—46

draft law was also taking many of the workers, actual and potential. Agriculture was likewise in an unusual situation. Its prosperity depended to a considerable extent upon exports. Before the lend-lease program was under way there was practically no export market for agricultural products. Farm surpluses were high. Yet farm prices were high and so was farm income—all without extensive government aid. The whole prosperity was based on the production boom and the money it placed in workers' pockets. There was also a capital goods boom in the U.S.—the building and equipping of the defense plants. Yet the boom was not financed by private investment as had been customary. It was almost wholly financed by the government. The U.S. supplied much of the capital, but many plants were financed by foreign governments.

By the end of the period of defense everyone was feeling the effect of the program. There was some frictional unemployment and there were shortages, but in many cases there was unparalleled prosperity. These shortages were in themselves cause for concern, particularly with the large amount of money in the hands of consumers. Prices might have gotten out of hand had not rationing of certain commodities—sugar in 1942 was first on the consumer's list—begun before this could happen.

War, 1942-45.—With the transition from defense to war following the Pearl Harbor disaster of Dec. 7, 1941, there was little abrupt change in the economy. The same trends continued toward larger and larger production of war material and toward more and more governmental control over every phase of the economic life of the nation. The Federal Reserve Index of Industrial Production, which had stood at 176 in Dec. 1941, had climbed to 225 by Dec. 1942 and on to 247 in Oct. and Nov. of 1943. After that it declined gradually until it stood at 232 in Dec. 1944 and 225 when victory came in Europe in May 1945. The production miracles of 1940 and 1941 were overshadowed by still greater miracles. Production in 1943 and 1944 was about double that of 1939, and early in 1945 it was at an even higher level. Steel capacity had increased 15%. This was an industry that had operated at half capacity or less in six of the ten years preceding the war. It was the same story over and over; a great part of the increased production was provided by a fuller utilization of resources than had ever before been realized. Many plants that did not operate 24 hr. a day in normal times began to operate on such schedules. In many organizations, labour's work week increased from 40 hr., above which the pay rate was 50% greater than for the first 40, to 48, 52 and even 60 hr. per week. Through this production miracle it was possible to provide the huge amount of material needed in waging the war plus a production for other consumption that was greater than the amount available in 1939. These measurements are in terms of dollars, and therefore, to the extent that the price level rose, the consumers had fewer goods and services than would otherwise be indicated. The rise in the price level, however, was hardly great enough to negate completely the consumers' improvement in position. Moreover, in addition to the consumption of current production, there was also much consumption out of inventory.

For several years before the war the federal government had been attempting to convert more of the productive capacity of the U.S. from heavy goods to consumers' goods in the belief that it might cure some of the nation's economic ills. During the war, with the great need for heavy steel castings instead of light sheets, there was a conversion to heavy goods production and new plants were built for this purpose. New nondurable goods capacity of some manufacturers increased 25% from the beginning of the war to 1943; durable goods capacity in some companies was up 600% in the same period. In this new industrial machine, plants became larger and larger. New plants sprang up in places that were not regarded as centres of large-scale manufacturing. Large aeroplane plants appeared in Fort Wayne, Ind., Oklahoma City, Okla., and in Wichita, Kan. Aluminum plants were built along the Columbia and Tennessee rivers in order to make use of abundant electric power. New steel plants were built in Utah—far away from the typical steel locations on the Great Lakes, at Pittsburgh, Pa., along the eastern slope of the Appalachian mountains, and around Birmingham, Ala.

The policy of giving the war contracts to the large, wellknown firms had to give way. In order to realize large production, it was necessary to utilize manufacturing plants, both large and small. The system evolved was the use of subcontracting. A large company received an order for a finished product. There were many parts it was unable to produce, so it in turn gave a contract to another manufacturer to make the part. This manufacturer in turn frequently subcontracted the job. In a sense each of these subcontractors became an operating division of the prime contractor. Yet many a small manufacturer had subcontracts from several prime contractors. Through this system, the small manufacturers were brought in touch with large-scale manufacturing methods. They learned them, and they reorganized their plants to utilize them. It seemed very probable that this would work a lasting change upon the economy.

During the war, transportation reached a critical stage. As has been mentioned, railroads were hard pressed, yet the volume of freight increased greatly. They handled it all, largely by increased loads per car, decreased numbers of bad-order cars awaiting repairs and by reducing unloading and loading times. Passenger travel increased 50% and was accommodated by using Pullmans only on longer runs, leaving the short trips to coaches. Even these coaches were so crowded that it was common for passengers to stand in the aisles for many hours. Ocean shipping was also a bottleneck because of the shortage and loss of ships and because of slower schedules. New shipyards broke this bottleneck with the building of Liberty and Victory ships. The overseas shipping was also helped by flying planes, loaded, direct to the theatre of operations.

The migration of management to government jobs in Washington, D.C., during the defense period was changed to a migration of management into the army and navy, where these men held key spots in controlling the production and flow of war materials.

The unemployment situation that so plagued the country in peacetime had now turned into a manpower shortage. To operate the new and enlarged plants, to supply the multiple shifts and to provide a rapidly expanding army and navy required a huge manpower supply. The War Manpower commission was established in an effort to balance the demands from the many sources and to stabilize the situation. In the plants producing civilian goods-the plants which had to sell under ceiling prices -the work-week was kept at 40 hr.; as the manufacturer could not pay time and a half for overtime, sell at or below the ceiling price, and make a profit. This ineffective utilization of manpower was one of the sore spots of the economy. Organized labour was also making new demands. It wanted a wage to compensate for the rising cost of living. In return for a no-strike pledge it demanded

a maintenance of membership clause in the new contracts. As a result of the overtime pay plus the relatively small rate increases granted, the workers' take-home pay increased about 50%.

Increased money in the hands of the workers gave additional buying power, yet the quantity of goods available for civilian purchase was no greater than it had been before the war. The miracle was that there was so large a quantity available. The Christmas buying rushes were far larger than usual. All of this gave rise to the much discussed inflationary gap. If all the money was to be spent for the limited supply of goods available, prices would inevitably increase. Price ceilings prevented this inflation; then, with price no longer the regulator between supply and demand, rationing of materials, directives and other government procedures were substituted. A distinct effort was made to take this excess money out of the consumers' hands through vigorous taxation and extensive bond drives, and it was estimated that about \$35,000,000,-000 went into bonds and bank accounts. Another large portion went into the real estate and securities markets, driving prices up. The Dow-Jones average of 30 industrial stocks, which had stood at 111 in Dec. 1941, averaged about 166 in May 1945 when victory came in Europe.

The priorities system of the defense period began to run into trouble. Several different agencies were granting priorities, which soon exceeded the amount of goods available to fill them. Various remedies were proposed, and the result was the Controlled Materials plan. This provided for an over-all control board which forced each ultimate user of the critical materials (army, navy, civilian) to make a statement of its needs for the coming period. The available supply was then distributed among the three in proportion to the urgency of the need. Each representative was then responsible for allocating a proper amount to his prime contractors and these in turn to the

Ironies of production and consumption in peacetime and wartime were pictured in this cartoon captioned "The Storm" by Herblock of N.E.A. Service, Inc.

subcontractors. By centralizing the top planning and decentralizing the details, material distribution worked reasonably well.

In 1944 many businessmen believed the end of the war was in sight. The problems of production for war were mostly solved, and reconversion problems became the chief concern. Industry started to make plans-for new products, personnel changes, new markets and new or revised marketing methods. They worked under great difficulties. Over all there hung a general fear of depression, based in part on the lack of balance in productive facilities for the peacetime demand. In part, also, the fear arose from the anticipation of unemployment when war production ceased and demobilization took place. Labour was also dismayed over the prospect that the cost of living would rise simultaneously with reduced labour income, as a result of the loss of highly paid jobs and overtime pay in war plants. Workers were naturally unhappy at the thought of the smaller take-home pay of

Yet there was the prospect of undreamed-of prosperity; the workers had accumulated large sums in war bonds and other savings which could be used to buy the new durable goods whose purchase had been postponed. During 1944 there were even some war contract cancellations, tempting business to develop trial models and to get ready for immediate reconversion. Industrial production sagged. Then came the Battle of the Bulge, and the military situation in Europe looked more serious for a while. Reconversion and contract cancellation were forgotten in a new swing to all out production. But at the beginning of the second quarter of 1945 it was apparent that Germany was beaten and contract cancellations began again, even before the surrender in May. This started a distinct downward movement in industrial production that continued through the date of victory over Japan in August. (See also WAR PRODUCTION.)

Reconversion 1945-46.-When reconversion got into full swing about Sept. 1, 1945, the index of industrial production was far below its wartime peak. In September it stood at 167, about one-third below the 247 of October and November 1943. Cutbacks had come fast with the surrender of Germany; after the defeat of Japan almost every government contract was cancelled. The first phases of this reconversion were far smoother than had been expected. Industry had its plans ready. Large war machinery was moved to storage and the long assembly lines for peacetime goods were put in place. In some plants these new assembly lines were in place and in operation before the half-finished tank on the neighbouring line had been removed. In some industries there was no reconversion problem. Cigarettes were suddenly plentiful, and the line-ups outside the local drug store disappeared. The heavier goods, however, the new refrigerators and automobiles, e.g., did not flood the market as rapidly. Even in 1946 a new model was a sight to command attention.

The predicted unemployment of 8,000,000 within a few months after the end of the war did not materialize. For September the estimate was nearer 1,500,000. The prediction that the economy would fall apart with the cessation of government spending also did not come true. By Nov. 1945 production had begun to increase and the industrial production index stood at 168. Then trouble began. Industry was plagued with strikes. The General Motors strike continued from Dec. into Feb. 1946 followed

by a severe coal strike that threatened the power supplies of many of the large cities. Later there was a two-day nation-wide strike on the railroads. Each of these seriously set back the expected reconversion, and the many subsidiary strikes hampered even more. As a result, the index of industrial production, which had risen from 152 in February to 168 in March, declined to 160 in May 1946.

These industrial difficulties and the relatively low index of production had a direct effect on consumers generally. For, although all production was for civilian use, few of the long-awaited consumers' durable goods were available for purchase. Moreover, serious food difficulties arose. In order to prevent mass starvation abroad it was necessary to make large shipments of food to the afflicted countries. In July 1946 there was even a bread shortage in the U.S.

One of the greatest accumulated shortages of wartime was in housing. The future of the building industry had seemed bright, but progress was slow because of shortages of essential material and labour; it was necessary for the government to continue restrictions and the use of priorities for building during 1946.

It was widely believed that many of the shortages were caused by the control policies of the government. The controlled materials plan of wartime had disappeared, but the price ceilings remained. Because of changed prices, price relationships which had been in accord with the economic conditions when price control was established no longer held. With the expiration of the price control law on June 30, 1946, and Pres. Truman's veto of its replacement (because he considered it too weak), business was left temporarily with a free market. As was to be expected, some prices were immediately raised, but others held at existing levels because of the fear of consumers' strikes, of creating ill will, or of losing the market to competitors. Business had high hopes that the economy would get back to normal. However, a new price control bill restored ceilings on many products in July, 1946 and on certain food products, including meat, on Aug. 20. The new bill also provided for orderly decontrol of all prices (except rent) by July 1947. As a result of the interrupted ceilings, chaotic conditions existed in respect to meat products in particular. This led to Pres. Truman's proclamation of Oct. 14, 1946, which removed all controls from meat; in November practically all controls were removed.

In 1946, business men were still looking forward to a postwar boom financed by the large amount of consumer purchasing power invested in war bonds and savings accounts. The stock market reflected the sentiment with the Dow-Jones industrial average more than 200. In September the market broke sharply and started downward; in October it was about 20% below the spring high. Production was increasing, prices were higher, but in certain spots business men were growing a little apprehensive of the future.

Finance.—Beginning with the Lepression in 1931, there was a gradual rise in the gross U.S. public debt from \$17,000,000,000 to \$36,000,000,000 in 1937, which continued to \$49,000,000,000 in 1941. Then, with the necessities of financing the war, the climb became more rapid, reaching a height of \$279,000,000,000 in Feb. 1946. During the following months of 1946, about half of each of the maturing issues of certificates was paid in cash and the other half refunded. This was done by drawing down the treasury balances created during the last of the big war loan drives and not by utilizing an excess of receipts over expenditures. The great wartime increase in debt was

financed by the sales of securities to banks and government agencies (50%), to institutional investors (12 $\frac{7}{2}$) and to private investors (38%). Particularly important from the economic point of view was the sale of savings bonds (later called defense and war bonds) to the small investor. These were issued in denominations as small as \$25, and subscription was encouraged through pay roll savings plans and public appeals. Two other types of savings bonds were also issued during the war for larger investors. A unique feature of these bonds was that the holder could redeem them at any time after a short initial waiting period. This had the effect of creating a large demand liability upon the treasury. The bonds were first issued in 1935; \$1,000,000,000 were outstanding in 1938, and \$4,000,-000,000 by 1941. The following years the amount outstanding increased to \$46,000,000,000, and in May of 1946 the amount had reached \$49,000,000,000.

Government expenditures increased from \$8,000,000,000 in the fiscal year ending June 30, 1937, to \$9,000,000,000 in 1940. Thereafter the increase was rapid, reaching a peak of \$100,000,000,000 in the fiscal year ended June 30, 1945. Ninety per cent of the latter sum was for national defense. In 1946, expenditures dropped sharply to \$65,000,000,000.

Government receipts from taxation and miscellaneous sources were about \$5,000,000,000 in 1937, of which 43% came from income taxes. By 1945, the receipts were more than \$46,000,000,000, more than nine times the amount in 1937, yet only 46% of the total expenditure. Of this 1945 total, income taxes contributed 72%, a fifteenfold increase in the total revenue raised from this source.

State government finances improved greatly during the war. The curtailment in revenue from gasoline and cigarette taxes was more than offset by the large yields in income, corporation, luxury and sales taxes. At the same time, expenditures for relief were very low and construction programs were suspended. Thus the states accumulated large surpluses which enabled some of them, notably New York, to reduce the rate of taxation. Other states conserved their surplus funds for debt retirement, veterans' benefit programs and for new construction programs which included schools, public buildings, highways, grade crossing eliminations, hospitals and irrigation projects.

During the ten-year period 1937-46 the stock market had its ups and downs, as evidenced by the Dow-Jones industrial average. On March 10, 1937, the industrial average reached a high of 194.40. From there it moved downward with interruptions, to March 31, 1938, when it reached a low of 98.95 a few months before the index of industrial production reached its low. There was a rapid recovery to 158.41 on Nov. 12, 1938. This was followed by a sharp downswing to 121.44 on April 8, 1939, caused by the war scares; then the market rose back to 155.92 on Sept. 12, 1939, just after Germany's invasion of Poland. From that point on the market went irregularly downward, reflecting the good and bad moments of the war until it reached a low of 92.92 on April 28, 1942. From that point the average moved upward until it reached a high of 212.50 on May 29, 1946. During the following two months of 1946 it moved in a narrow range slightly below the May high. Throughout Sept. 1946 the market dropped rapidly and the Dow-Jones industrial average stood near 170 during the first weeks of October.

During the entire ten-year period, the yield on long-term bonds moved downward. The yield on Moody's Aaa bonds dropped from 3.26% in 1937 to 2.49% in 1946, a 24% decline. This decline was aided by the government in its desire to keep its own interest cost at a min-

imum. The Baa bonds had an even greater decline, from 5.03% in 1937 to 2.98% in 1946. The spread between the two types of bonds progressively narrowed. In 1937 the Baa bonds were yielding 54% more than the Aaa bonds, indicating the premium required by investors for the greater risk. By 1946 this spread had been reduced to such a point that the Baa bonds were yielding only 20% more than the Aaa bonds. The change in differential was partly a result of the decline in yield of the Aaa bonds, tempting the investor into lower quality securities in an effort to maintain his income. It was also a result of the high level of economic activity, causing the investor to minimize the chances and the consequences of depressed business conditions.

The yield on municipal bonds dropped very rapidly in relation to the drop in yield of other types of securities. In 1937 municipals were selling to yield 3.10%, only slightly under that of Aaa corporate issues. But by 1946 municipal bonds were selling to yield only 1.50%, a full 40% less than the Aaa corporate bond. This change in relationship was caused by the federal income tax structure. Municipal bonds were exempt from taxation, and with increasing tax rates, the relative advantage of owning them in preference to taxable bonds increased.

This reduction in the interest rate on long-term bonds made it profitable for corporations to call many of their outstanding bonds and to issue new ones at a substantial saving in interest. There were also cases where preferred stocks were called and replaced by bonds. Many of the refunding issues were sold through the regular channels of distribution. There was increased control of the new issues through the Securities and Exchange commission. One of the noteworthy results of the commission's requirements was the greater amount of information available to the investing public.

Another development was the increasing sale of securities to underwriters by competitive bidding instead of placing the securities with the company's traditional investment bankers. In addition to the sales through the underwriters, there were many sales directly to large institutional investors including the life insurance companies. The new level of low yields on securities forced life insurance companies to increase their rates by one sixth. In the years 1937 through 1939, the net proceeds of new security issues ran slightly greater than \$2,000,000,000 per year. In 1940 and 1941 it ran about \$2,500,000,000 per year. During the next two years the volume was considerably smaller, partly because of the huge volume of federal securities which the market was called upon to absorb. In 1944 new corporate security issues amounted to almost \$3,000,000,000; and in 1945, with a slackening in the rate of government issues, private financing jumped to more than \$5,500,000,000. Through the early part of 1946 the rate of issuance continued at a high level. More than 80% of the new issues were for refunding purposes. Public utility companies accounted for almost half of this refunding, and the rest was about evenly divided between railroads and industrial corporations. Almost all of these new securities were bonds, although in 1946 stocks made a somewhat larger contribution to the total than previously.

During the decade, business also turned to sources other than the security markets for its financing. Outstanding loans of the Reconstruction Finance corporation to business amounted to \$125,000,000 in 1939. By 1942 twice this amount had been loaned. The Defense Plant corporation was also financing business in an indirect way through its building of war plants for the use of private corporations. Factoring of receivables was appearing in types of busi-

ness not customarily using this form of financing. Business was also borrowing to a large extent from the banks. Assignment of inventories as security for bank loans through the aid of field warehousing was becoming prevalent. Formerly, the traditional bank loan had been for a fairly short term. By the end of the decade, banks were making "term" loans to business for periods of several years. Frequently, these loans were so large that several banks across the country, or even competing banks in the same locality, participated in the loan.

All of the loans of this period were made at fairly low interest rates, and several large corporations borrowed in order to retire outstanding bonds which bore a higher rate of interest. During World War II there were the V, the VT, and the T loans by banks on amounts due or about to become due on war contracts. These loans were partially guaranteed by the war or navy department or the maritime commission. Provision was made that if the contract should be cancelled with a consequent delay in receipt of the funds, the loans were automatically extended. Contractors were thus provided with adequate finances to continue business where their working capital might otherwise have been frozen by a large cancellation. The General Motors corporation received a \$1,000,000,000 line of credit under this arrangement. It was the largest bank credit ever extended to an industrial or commercial enterprise.

The government guarantee of loans also became important through the Federal Housing administration, the amount of guaranteed loans rising from \$94,000,000 in 1936 to \$6,700,000,000 in 1946.

The large volume of war business brought about interesting changes in the composite balance sheet of 120 large corporations (prepared by the National City bank of New York). From 1940-44 total cash increased about 40%; government securities about eleven times; receivables about 80%; inventory about 60%. The gross fixed assets increased only 10% but because of a greater increase in the depreciation reserves the net fixed assets actually declined slightly. The increase in assets was financed largely by an increase in the current liabilities, which more than tripled. There was also about a 20% increase in the capital stock and surplus. By the end of 1945, several months after the end of the war, most of these upward trends had been reversed. Cash, government securities and gross plant had declined; so had the current liabilities. Inventories, capital stock and surplus continued to

Consumer short-term debt usually rises and falls with the business cycle. It followed this pattern throughout the first years of the decade 1937-46, reaching a high of \$9,500,-000,000 in 1941. Later, consumer scarcities became acute, and the consumer durable goods usually bought on the instalment plan (particularly automobiles) were no longer available. In view of this situation, the board of governors of the federal reserve system issued Regulation W, which put severe limitations on the use of consumer credit, not only on instalment sales but also on the regular charge accounts of the department stores. Officially, the general purpose of controlling the use of credit was to divert demand from the industries which would otherwise be contributing to the war production, to restrain the inflationary tendencies and to make a better consumer demand and debt structure for the postwar period. Immediately after the end of the war consumer debt began to rise. In the prewar period, commercial banks had only about 16%

of the consumer instalment loan business, but by May 1946 they had 37%. This expansion was largely at the expense of the industrial banks and finance companies.

The commercial banks had an important role to play throughout this period. They were called upon to buy large quantities of bonds and short-term securities from the government. Such action was possible because of the large quantity of excess reserves and because of revised banking regulations permitting the replenishment of depleted reserves by the sale of bills and notes to the federal reserve banks, and in turn permitting the reserve banks to use government securities as reserve for their note and deposit liability. Directly related to this procedure for absorbing new federal debt by the banking system was the expansion of the total money supply (both bank demand deposits and currency) from \$39,000,000,000 in 1940 to \$171,000,000,000 in July 1946, more than four times the amount just six years before. The banks also loaned large amounts to industry (partly with government guarantee). Demand deposits rose more than 150% as measured by the figures of the reporting member banks of the federal reserve system. The investments of these banks increased 250%, accounted for mostly by the purchase of government securities. However, important as the loans to industry were, the increase was only 65%. The federal reserve system raised the reserve requirements from the minimum provided in the law (7%, 10% and 13%) to the maximum (14%, 20% and 26%) in May 1937, when prosperity was high, reduced them slightly near the depth of the slump in 1938 and raised them to the maximum again in 1941, when the dangers of the inflationary period became apparent. For technical reasons it was necessary to lower slightly the required reserves on large city banks in Aug. 1942.

The banks made two other significant contributions to the war effort: they acted as the focal point for the issuance of government securities in the war loan drives, and they assisted in the rationing organization by establishing

"We'll Have to Keep Them in Step." A reference to the critical labour shortage in the U.S. during World War II, by Bishop of the St. Louis Star-Times

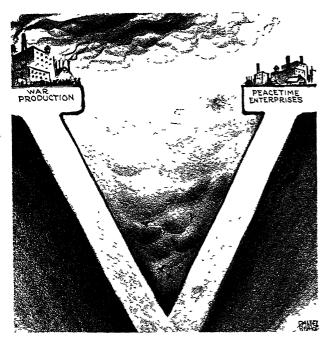

bank accounts not in dollars but in gallons of gasoline, pounds of sugar, pairs of shoes, red points, etc. Retailers could deposit their coupons from the consumer, and draw checks on their deposit in the purchase of supplies. The ration bank accounts were then used instead of the consumers' coupons at all other levels of the rationing control. (See also Banking; Consumer Credit; Debts, National; Income and Product; Stocks and Bonds, Taxation.)

Labour.-Labour made large gains during the decade; beginning with the National Industrial Recovery act in 1933, legislation was generally favourable to it. The NIRA set up the National Labor board for mediation of disputes and authorized the codes under which labour was frequently granted minimum wages and maximum hours. The NIRA was declared unconstitutional in 1935, but the National Labor Relations act (Wagner act), passed the same year, substantially restored the labour relations provisions. It provided for freedom of association and self-organization; encouraged collective bargaining; and prohibited certain unfair labour practices by employers. The National Labor Relations board was created. This board interpreted and gave administrative meaning to the unfair labour practices enumerated in the act. It also held plant elections to determine collective bargaining agents. As the Wagner act was practically a restatement of the labour provisions of the unconstitutional NIRA, there was anticipation that it too might be declared unconstitutional, and it was not accepted immediately in a wholehearted fashion. However, it passed the test in the U.S. supreme court in 1937, and from that time on the National Labor Relations board gained in power and respect. The Walsh-Healey Public Contracts Act of 1937 forced the adoption of many of the NIRA standards in government contracts more than \$10,000. These included provisions as to maximum hours, child labour, safety and health.

The Social Security act, passed in 1935, did not become fully operative until 1937, when the first pay roll deductions were imposed for old-age benefits. This act provided for three general types of benefits: social insurance, public assistance to the needy and health and welfare services. Under social insurance were the old-age and survivors' insurance provisions and the employment security provisions, including both unemployment insurance and public employment service (administered by the states with federal aid through the U.S. employment service). The USES acted as a regular employment agency until wartime, when its objective was broadened in an effort to channel available workers to places where their services would be most effective. Certain types of labour were not covered under this act. For example, farm labour was excluded and railroad labour was covered under its own Railroad Retirement act passed in 1937.

In 1938 the Fair Labor Standards act (Wage and Hour law) was passed. This provided minimum wages and maximum hours for about 21,000,000 employees. The maximum work week was set at 44 hr. in the first year and gradually reduced to 40 hr. by 1940. The minimum wage was 25 cents per hour the first year and increased to 30 cents by 1939 and 40 cents by 1945. Payment for overtime was required at one and a half times the base rate.

The traditional labour union was usually organized on the craft basis. The men with different skills belonged to different unions, and the unskilled workers were, for the most part, unorganized. In 1935, the Committee for Industrial Organization was formed, without official sanction, by certain of the American Federation of Labor leaders. Its objective was to organize the unorganized workers in

"Not a Victory until the Valley of Depression is Bridged," by Bishop of the St. Louis Star-Times

mass production and other industries on an industry basis. Under this new form of organization all workers in a plant, regardless of skill, belonged to the same union. Leaders of the traditional labour unions opposed this movement and the conflict of opinion within the A.F. of L. (q.v.) caused the industrial unions to be suspended and later expelled. They formed the Congress of Industrial Organizations (q.v.) as a separate federation of unions with John L. Lewis as president in 1938. At this time it had a little more than 3,500,000 members, whereas the A.F. of L. had slightly less than this number.

The C.I.O. had its first test of strength during the period of sit-down strikes in the plants of the "Little Steel" companies, General Motors and others. Injunctions granted by the court restraining the employees from occupying private property were ignored. The C.I.O. was also responsible for the large strikes in the west coast shipping industry in 1937. The major issue of that year was union recognition. In 1938 the strikes were not as numerous, partly because of the sharp business recession. Large and important strikes occurred in 1939; the two major ones were in the coal mines and the automobile industry where the union shop and exclusive bargaining agent clauses were at issue.

There were a great many strikes in the first part of the year 1941. With the extensive U.S. defense program underway, the unions saw a possibility for increased wages and feared the probability of a rising price level. In March, the National Defense Mediation board was created to assist labour and management in settling their difficulties by taking over labour disputes when the conciliation service had not been able to adjust the situation. Strikes were called at Bethlehem Steel, which had resisted unionization when U.S. Steel became unionized in 1937, at International Harvester, where no little amount of violence occurred, at the Glenn L. Martin plant (aeroplanes), where the A.F. of L. and the C.I.O. were competing to organize the aircraft industry, at Allis Chalmers and in the coal fields. In the coal strike John L. Lewis was attempting to organize the "captive" coal mines belonging to the large steel companies, which previously had resisted organization. Refusing to accept the decision of the National Defense Mediation board which rejected the closed shop, he threatened a strike. As no agreement was reached, the miners walked out. About three weeks later an arbitration board awarded them the closed shop and the miners went back to work.

Shortly after the U.S. declaration of war in Dec. 1941, the president's conference was called to bring labour and management together. The National Defense Mediation board, which had become ineffective after the coal strike, was replaced by the National War Labor board. The president declared that there were to be no strikes or lock-outs, that labour disputes were to be settled peacefully, and that the NWLB would handle labour relations difficulties. The unions pledged that there would be no strikes in war material production except in those cases where employers refused mediation, conciliation, or arbitration. The situation was relatively quiet for more than a year. In the first part of 1943, however, many coal miners walked out of the mines in strike against the union leaders' decision, made without consulting the members, to increase assessments and to work a longer week (with time and a half for overtime) in order to meet the war production needs. They did not return until about three weeks later, when Pres. Roosevelt ordered them to do so. In the spring of 1943 there were strikes of automobile and rubber workers against decisions of the War Labor board. The coal miners struck in May to enforce their demands for portal-to-portal pay; Lewis called a temporary truce and, though coal production continued, there was a "war of nerves" for several weeks. When Lewis refused to recognize the orders of the War Labor board, the War Labor Disputes act (Smith-Connally antistrike bill) was passed. This provided, among other things, for a go-day cooling-off period before a strike could be called and gave the government the power to seize the plant in case of a labour stoppage that would threaten war production. The coal mines were seized under this act in June and the railroads in Dec. 1943. All were returned to private operation after the difficulties had been adjusted—usually in a few weeks. The War Labor Disputes act also prohibited labour unions from contributing to political campaigns. This prohibition led important C.I.O. leaders and others to form the Political Action committee (q.v.).

During the war labour problems became more and more difficult. For years many employers had complained of the decreasing efficiency of employees caused, they declared, partly by union "featherbedding" rules and partly by the employees' feeling that they could "get away" with decreased effectiveness because of the employers' fear of the union. Now there was a third factor; the necessity of hiring less-skilled employees. There were also severe shortages of labour in the war industries, and yet there were surpluses at other points. The maldistribution was between geographic centres and between types of work. Many agricultural workers left the farm for jobs in war plants. Yet many city workers, lacking the requisite skills, were unable to get such jobs. Moreover, Selective Service was making serious inroads on the labour force. The difficulties of industry were increased by a number of other factors including: (1) employees changing jobs for higher pay; (2) employers failing to use employees effectively and, in some cases, even hoarding labour; (3) inadequate housing and transportation causing a high labour turnover; (4) employer prejudices in hiring workers; (5) labour

piracy; (6) overconcentration of war contracts in some areas; and (7) the lack of comprehensive over-all training to supply the needed skills. Inflation was another problem, and the competition of employers for workers and the natural desire of all workers to obtain higher wages made a wage-price spiral a distinct probability. Voluntary action worked well during the first two years of war in Europe, but by 1941 this combination of factors created an urgent need for some government control program.

In April 1942 the War Manpower commission was established to co-ordinate the different manpower agencies. It had power only to issue directives and was not wholly effective until it was given real power in December of that year. Basically, its job was to decide who should work where and when. It had the problem of balancing the military needs, the munitions production needs and the civilian production needs. There were two types of control plans used in different localities. The first was applied to jobs in industries confined to a small area. The rule was set up that an employee could not transfer from one job to another without permission both from his employer and from the USES, and a further rule was made that there could be no labour "pirating" by employers. In other areas the second type of control provided that all hiring had to be done through the USES. This second type of control was the so-called job-freezing regulation. Anyone who quit his job without permission was subject to induction by the Selective Service and, if not inducted, could not be hired by another employer for 60 days.

Table I shows a part of the over-all problem confronting the War Manpower commission.

Table I.-U.S. Manpower Distribution, 1941 and 1944

	4th quarter 1941	4th quarter 1944	Increase of decrease
In armed forces (millions)	2.0	11.9	+9.9
Men in labour force ,, Women in labour force . ,, Total labour force ,,	39.9 13.9 53.8	34.0 18.0 52.1	-5.9 +4.1 -1.7
Men employed , , , , , , , , , , , , , , , ,	37.5 12.9 38.8 31.7 42.9	33.7 17.7 43.3 33.6 45.5	-3.8 +4.8 +4.5 +1.9 +2.6
Total employed (millions) Source: Statistical Abstract of U.S., 19	50.4 44–45, p. 127 fl	51.4	+ 1.0

The figures show the siphoning of manpower into the armed forces. The fact that the men in the labour force did not decrease by a like amount was caused by the drawing into the armed forces of many young men from schools, and to the influx of older men who had not previously been a part of the labour force. The difference between the total labour force and the total employed represented unemployment, and it was clear that the difference had been reduced. The increased age of the workers was the result of three factors: the drawing of the younger people into the armed forces, the return to work of previously retired people and the postponement of retirement of many who would otherwise have dropped from the total labour force. The reduction in unemployment, retention of older workers in the labour force and the increased length of the work week indicated the WMC's source of the added workers needed for the huge task of war production. The part of the over-all labour picture which could not be shown as well statistically related to (1) the need for people with specialized skills in proportion to the number of such people available, and (2) the reduced efficiency of the workers caused by long hours, work on jobs for which they were not trained and featherbedding.

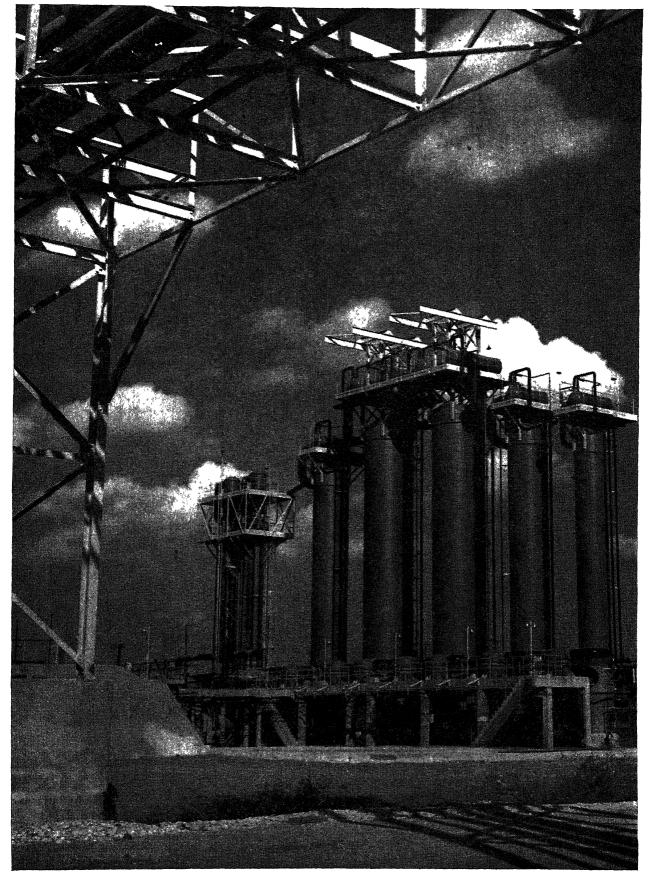

In the spring of 1942, wage troubles arose in the plants of certain of the smaller steel companies, and the WLB set the "little steel formula" in July 1942 as the pattern for general wage increases. The cost of living was calculated to have risen 15% from Jan. 1941 to May 1942, and therefore wage increases were not to exceed 15%. Correction of gross inequities (both interplant and intraplant) by wage increases was allowed as another exception provided by the Price Control act of Sept. 1942. Late in 1942 the Office of Economic Stabilization was created under a power granted to the president under the Economic Stabilization (Price Control) act. This agency was given control over prices of commodities, rents, wages, salaries, rationing and subsidies.

The effectiveness of the wage stabilization work of the WLB may be judged from the fact that the increases actually permitted by the board, averaged over the entire working population, amounted to less than one cent per hour. The other great contribution made by the board arose out of its second main obligation, the settlement of labour disputes not involving wages. Faced with the unions' demand for a closed shop and the employers' demand for a freezing of the status quo, the WLB avoided an impasse by developing the so-called "maintenance of membership" formula. This operated as follows: once a given union was designated as the authorized collective bargaining agency in a given plant, employees of the plant were afforded a two-week "escape" period, during which they had to decide whether they wished to belong to the union or not. At the end of the two weeks, those who wished to stay in the union were compelled to remain in that status for the life of the contract, and those who notified the employer that they did not wish to belong to the union were permitted to retain that status during the life of the contract without loss of job. Both union and employer members of the board came to accept this compromise developed by the public members.

With the coming of peace in 1945, there was temporary apprehension over reconversion unemployment. When this proved to be much smaller than expected, a serious wave of strikes occurred in the steel, automobile, electrical products and nonferrous metals industries. There were also serious strikes of anthracite coal miners and of maritime and dock workers. Many small strikes hampered industry and caused a shortage of important parts through 1946. Serious as these strikes were, they did not threaten a complete paralysis of the economic system as did the soft coal strikes in the spring and fall, and the railroad strike in June. Many cities were forced to curtail electric power consumption more severely than at any time during the war, and the railroad strike threatened certain large cities with severe food shortages.

In this postwar wave of strikes, the usual settlement was an 18–18.5 cent wage increase, precedent for which rested upon a decision of one of Pres. Truman's fact-finding boards early in the strike period. One of the wage arguments most commonly used by union leaders was the ability of the company to pay. A new "method" of wage settlement appeared in certain instances, especially the coal strike: the union made demands, the established conciliation machinery reached a formula for settlement, the union refused to accept the recommendation, a presidential emergency board (established for the specific case) reached a different formula for settlement which the union

Styrene plant at Velasco, Tex., which operated under government contract during World War II to produce hydrocarbon used in the manufacture of synthetic rubber. The plant had a capacity of 75,000 tons annually

again refused in order to hold out for higher stakes which could be obtained when the president was forced to intervene. These labour difficulties became so serious that drastic antistrike legislation was brought before congress. When the railroad strike was broken in May 1946 by the government, the strike period reached its climax. After that, public opinion cooled, and the more drastic legislative proposals were dropped. The Hobbs act was passed shortly afterward, amending the anti-racketeering bill and making violence and destruction of property illegal.

In 1946, labour discussions centred around the guaranteed annual wage, security questions, production and efficiency of workers, vacations with pay, health, safety and pensions. Even the 30-hr. week was mentioned. The question had been raised as to why, if the government could bring about full employment in wartime, the nation could not have full employment in peacetime. After congress rejected drastic legislation requiring the president to present annually a program of public works and other economic measures designed to bring about full employment, it passed the Employment Act of 1946. This act created (1) a Council of Economic Advisers to aid the president in drawing up a program to promote maximum employment and production, and (2) a joint congressional committee to make findings with respect to the president's recommendations. The first appointments to the council were generally considered to be able men and to be above politics.

During the decade 1937–46, the average hourly wage of employees in manufacturing increased from about 62 cents in 1937 to 66 cents in 1940, to 73 cents in 1941 and to \$1.04 by V-E day in 1945. From that time until Nov. 1945 the average wage fell to 99 cents before it began its climb until it stood at \$1.07 in May 1946.

There was no consistent series of figures on total employment available, but the U.S. department of labour's indexes of production-worker employment in manufacturing gave a good picture of the volume of employment during the period. The index stood at 104.8 in Jan. 1937, rose to 112.3 by August and then slipped down to a low of 85.5 in June 1938. The rise from that time on was almost uninterrupted, reaching 107.0 by Dec. 1939, 117.4 by the end of 1940, 141.1 at the end of 1941, 168.7 by the end of 1942, to a peak in Nov. 1943 of 181.9. From that point it slipped back to 159.8 in May 1945 and 128.5 in September after V-J day. The index rose fairly steadily from Oct. 1945 through Jan. 1946 reaching 130.2. With the strikes in February it dropped back to 121.9 but rebounded quickly, reaching 138.4 in June 1946. (See also EMPLOYMENT; LABOUR UNIONS; STRIKES AND LOCK-OUTS; WAGES AND HOURS.)

Volume of Trade.—U.S. domestic trade at the retail level increased constantly from 1939 through 1945. The 1937 sales had been \$42,000,000,000; the total decreased slightly in 1938, but by 1939 it was back to the 1937 level. By 1945, total sales had risen to \$75,000,000,000. Table II shows total retail sales annually from 1937 through 1945 both in total and divided between durable and nondurable goods.

In the first seven months of 1946, retail sales totalled \$52,000,000,000,000,000,000,000 was in durable goods. From these data the wartime shift from the manufacture of durable goods for civilian consumption is apparent. During the war period, durable goods sales rose until the U.S. entered the war and then dropped back to the level prevailing before the start of the war in Europe.

From 1939-44, the value of most types of durable goods sold increased substantially; jewellery led with an increase of about 200%. But sales of automobiles and accessories declined. They dropped to less than half of their former level, as productive capacity was made available for munitions. Nondurable goods sales about doubled during this period. Most individual groups did the same. The widest variations were filling stations, the sales of which declined slightly, and eating and drinking places, the sales of which nearly tripled.

The rise in sales roughly paralleled that in retail trade. Such a rise in volume of business is typically accompanied by an increase in inventories, but this did not occur during the war years because of the shortages of goods. The demand for goods was so large that they were almost swept from wholesalers' shelves.

Such rapid turnover of merchandise was a great help to wholesalers in that it increased their total profit at a time when their profit margin was being squeezed and enabled them to avoid being caught with a stock of war quality and style goods when better supplies became available.

In selling \$47,000,000,000 worth of merchandise in 1939, manufacturers used approximately the same channels of distribution they had used ten years earlier. Table IV shows the per cent of sales handled through each channel in both 1939 and 1929.

The major change apparent was the decreased use of wholesalers and jobbers and the increased used of manufacturers' own wholesale branches and offices and direct sales to retailers.

There were several important developments in the marketing field during this period. In 1936 the Robinson-Patman act had made it illegal to sell goods if there was discrimination in prices or services between individuals.

Rush of 1946 Christmas shoppers at Macy's department store in New York city. Full employment and the rise in national income brought record sales to retail stores throughout the United States during World War II and the immediate postwar period

It became necessary for sellers at wholesale to justify their quantity discounts and advertising or other selling services, to prove that the discounts or the costs of the services given to some purchasers but not to others did not exceed the savings in selling, delivery, or production costs realized in selling to such purchasers. A further result was an increased interest in the study of marketing methods and costs. For a number of years before 1936 there had been a growing realization of the need for careful study of marketing costs, and the necessity of meeting the requirements of the Robinson-Patman act gave further impetus to this trend. This was particularly noticeable in the attempt to improve methods of selecting, training, and managing sales personnel and in the improvement of incentive payment plans for salesmen and management. There was also an important trend toward more extensive market research, prepackaged items and self-service in retail stores. The Miller-Tydings Act of 1937 clarified the legal status of manufacturers desiring to stipulate the prices at which their identified products could be resold. This practice had been legalized by 40 states and the Miller-Tydings act supplemented these state laws by making such agreements legal in interstate commerce.

With the coming of the war, retail stores faced many problems. Specific problems varied from store to store and usually included one or more of the following: price control, rationing (particularly burdensome to food stores), substitute items, duties to fulfil in civilian defense, patriotic campaigns including particularly war bond and stamp sales, manpower shortages, transportation bottlenecks, unprecedented taxation including the necessity of acting as tax-collector for the government on many "luxury" items. In connection with price control, an important problem arose because of the imposition of a general price ceiling in March 1942 on all Items at all levels of distribution. Because of the normal price lag between wholesale and retail levels, the retailers had an abnormally narrow profit margin in the spring of 1942. It was not until autumn of that year that the situation was alleviated by "rolling back" the prices of wholesalers and manufacturers. But in spite of the many difficulties they faced, retail stores made increased profits. Several factors were responsible. Careful control was exercised over expenses and many expense items were eliminated altogether. Sales volume was very high because of the high level of consumers' spendable income; and, because of the necessity of protecting the majority of retailers, the profit margins allowed by the Office of Price Administration were generally satisfactory.

After 1937 no additional states passed tax laws which discriminated against chain stores, and discriminatory taxes of Kentucky and Pennsylvania were declared unconstitutional in 1938. For several years there had been an attempt by Congressman Wright Patman to put through a bill imposing a fantastic federal tax on chain stores in an attempt to drive them out of business. This was finally overwhelmingly defeated in the ways and means committee and ended a period of discriminatory action against chain stores. During the years immediately preceding the war the chains had undertaken a large program of new construction and modernization. Ten per cent of all units had been built in 1940 and 1941 and 20% of the units had been modernized. The war stopped this major program, but even so the stores were in good shape to go through the war. There was a distinct trend to close many units of the chain store systems and to open larger-sized units. This made it possible to handle the same volume of business in fewer stores. There was also a tendency to curtail the delivery of products on the theory that the chain itself had a delivery system built up, and that this system need not be duplicated with attendant costs.

Materials Control in Wartime.—As the U.S. defense program expanded in 1939 and 1940, the supplies of certain critical materials tightened, and a system of priorities was set up to assist business in obtaining the materials needed for the defense contracts. These early priorities were on a purely voluntary basis, and the preferences were limited to army and navy prime contracts. Later, as the supply situation became tighter, mandatory priorities were inaugurated. Moreover, the volume of priorities soon became so great that it was necessary to replace individual rating certificates with blanket preference orders which gave a procurement rating to a whole general class of products. By the spring of 1941, the system of priorities was proving inadequate, and it was supplemented by the conservation (M) orders. These prescribed permitted and nonpermitted uses for each material. At first only aluminum was covered. Later magnesium, copper, steel, other metals, chemicals, textiles and other products were included. These orders merely restricted the use of the raw material. By the summer of 1941 the limitation (L) orders were being given. These restricted the output of the finished product. The first L orders cut down and eventually prohibited the production for civilian use of automobiles, trucks, refrigerators, washing machines, electrical appliances and other consumer hard goods. The purpose of the orders was twofold: to conserve critical materials and to force the conversion of peacetime plants into the war effort.

More of the preference currency was being given out than there were supplies available, because of the lack of quantitative control under this system of priorities and M and L orders. The preferences were constantly losing value. The A-1 priorities had to be subclassified into A-1-a to A-1-j. Then an AA priority had to be superimposed and on top of that an AA-1 priority. This system was the result not only of lack of quantity controls but also the result of extremely difficult integration and scheduling of material needs. Unbalanced and contradictory allocations were possible under this system. The paper work of manufacturers was multiplying, and a premium arose on competitive expediting of materials. These difficulties led to the formation of the Production Requirements plan (PRP), established in Nov. 1941 on a voluntary basis. This plan permitted manufacturers to present to the War Production board a complete picture of their operations and to state their production material requirements. Then priorities were granted for the particular production schedules on a quantitative basis: they were not granted as a means of expediting an already laid-out schedule. As long as there was a large segment of industry outside the plan, however, it could not be wholly effective. Wide areas of consumption requirements were unknown. Consequently, in the third quarter of 1942, the PRP program was made mandatory for all except the smallest manufacturers. This was a definite attempt to bring together all information on requirements for the materials in short supply and to allocate the prospective supply of these items.

By the third quarter of 1943, the Controlled Materials plan was set up as an improvement on the PRP. The same basic concept of allocating materials to meet specific production schedules was used, but the procedure was substantially altered. Under this system, a vertical allocation plan was used. Allotments were made to specific programs. The government procurment agency received an allotment which it divided among its prime contractors. These in turn passed parts of their share on to the subcontractors and so on down the line. It proved a far better system than the PRP under which direct applications for materials were received from all levels of production. The War Production board in this change lost definite control over inventories but gained a more important control over programs and brought about a better balance in the tight war economy. The actual Controlled Materials plan itself covered only three basic metals, but the same principles were applied for other materials in short supply.

In the summer of 1944, when it appeared that the war might end shortly, the War Production board began preparing plans for removing the controls and returning the country to the normal free economy. Restrictions were removed from aluminum and magnesium for experimental models of peacetime products, and prohibitions were removed on unrated orders for capital equipment. (The removal of prohibitions did not automatically allow such orders to compete with war orders, for the latter still had priorities; such orders could be filled only if idle capacity was available to produce the goods.) The Spot Authorization plan was established to absorb unemployment whenever it might be created by military cutbacks. In Dec. 1944, military reverses retarded the operation of the plan, but all was in readiness for V-E and V-J days in the spring and summer of 1945. Two hundred regulations were lifted between the European victory in May and the Asiatic victory in August. By October only a few of the WPB controls remained. These were primarily to prevent speculation and hoarding in scarce commodities and to regulate their consumption until supply became normal, to assure the fulfilment of the few remaining military orders and to give a preference rating to any order to ease a bottleneck that might hamper civilian reconversion. The War Production board was changed to the Civilian Production administration, which continued to exercise such powers, particularly in the housing program, throughout 1946.

Donald M. Nelson (left), chairman of the War Production board, testifying before the committee headed by Sen. Harry S. Truman (facing Nelson), which investigated lags in the U.S. national defense program during 1942–43

New Construction.-The last big boom in residential building prior to 1937 occurred in the 1920s. In spite of the need for new housing, caused by the normal growth in population and the depreciation of residential property, there was a virtual cessation of new construction during the early 1930s. During the 1920s there had been a swing toward home ownership which was largely nullified by mortgage foreclosures during the depression in the early 1930s. In 1939 another building boom started. This might have swelled to a large volume had it not been curtailed severely after the U.S. entered the war at the end of 1941. Curtailment was caused primarily by a shortage of materials and skilled labour available for such construction. These factors of production were urgently needed for the war effort, and the rulings of the War Production board made the change mandatory.

The construction of naval and military installations and of industrial facilities for the war machine began in a small way at the start of World War II, when the purchasing commissions of Great Britain and France began to place large orders and to provide the funds with which to build the plants. The real upswing in such construction came in 1941, when it appeared that the British empire and the Union of Soviet Socialist Republics would need to devote their total resources to winning the war, and when Pres. Roosevelt pledged "all aid short of war." The peak construction activity occurred in 1942, and after 1943 new construction was on a limited scale. This did not indicate a depression of activities and a hindrance to the war effort, but rather the virtual completion of the total war plant and hence the ability to devote resources, materials and manpower to producing the actual munitions for war. In 1939 it was estimated that the total productive capacity of the U.S. had cost about \$40,000,000,000 to construct; by 1944 facilities costing \$25,000,000,000 more had been added. Even allowing for depreciation and the higher cost of building, it was fairly safe to say that the industrial plant of the country had been increased 50%. Several industries were built virtually from the ground up. These included synthetic rubber, aviation gasoline, explosives, guns and ammunition, aircraft, shipbuilding, aluminum and magnesium. Of course, many of these indus-

"Uncle Gulliver," picturing U.S. industry hamstrung by labour disputes after the close of World War II, in a cartoon by Shoemaker of the Chicago Daily News

tries were in existence prior to the war, but the war requirements were far in excess of anything dreamed of in peacetime. About two thirds of the cost of this building was paid for by the treasury department directly. A good part of the balance was also paid by the treasury department through reduced income taxes, by allowing a deduction from taxable income of depreciation on war plants at an accelerated rate (20% in most cases).

A third phase of new construction activity got underway almost immediately after the cessation of hostilities in Aug. 1945. This activity was mostly in private residential and industrial buildings. Within a few months, however, materials were in such short supply that it became necessary for the Civilian Production administration to exercise a substantial degree of control. This control took the form of drastic restrictions on all industrial and commercial buildings and on moderate and high-cost residential buildings. It was felt that the greatest need was to create housing facilities for the many returning veterans and their families, and that the low-cost projects would solve the immediate problem most effectively. (See also Building and Construction Industry; Housing.)

Transportation.—By carrying a huge volume of wartime traffic, the U.S. transportation industry made an impressive record in the years from 1937 through 1946. The railroad industry, for the first time, was able to operate at capacity and to enjoy the related efficiencies of operation. This record was all the more remarkable since it was impossible for the various transport agencies to add greatly to their normal prewar equipment. The railroads did, however, improve their fixed plant by continuing the elimination of curves and the reduction of grades. The installation of centralized traffic control on many lines was another important improvement. Through this elaborate signalling and switching mechanism, a single man could control the switches and signal for a hundred miles of road, and a single-track road could be given a traffic

capacity equal to three quarters that of the normal double-track line.

The most significant advance in equipment was in the use of diesel engines. The first lightweight diesel-powered passenger trains appeared in 1934, and it was in 1940 that diesel service was inaugurated for freight service. Diesel-powered freight trains were able to operate at passenger train speed, thus converting a few sections of line into single speed railroads and thereby eliminating the delay involved in switching slower trains onto sidings to clear the track for faster trains.

Before and during the war, several roads came out of bankruptcy, with their debts and fixed charges substantially reduced. Part of the fixed charge reduction was accomplished through the use of bonds on which part or all of the interest payments were contingent upon earnings, and part because of declining interest rates. During the war most of the roads were able to make substantial reductions in their funded debt and the related fixed charges.

The Transportation Act of 1940 relieved the Interstate Commerce commission of the duty of planning for the consolidation of railroads. On all but military and naval property this act also removed the land-grant rates at which certain railroads (which had received large grants of public lands in the expansion era) were required to transport government property at a substantially reduced rate. In 1946 these land-grant rates were removed entirely. (See also Railroads.)

During the decade, public transportation by truck became a more mature business. The Motor Carrier Act of 1935 was just beginning to show its effects by securing more reliable service without destructive competition. This act gave the Interstate Commerce commission complete power over common and contract carriers as to service, accounts, records, reports, hours worked by employees, safety, consolidations, rates, routes and security issues of more than \$500,000. On the other hand, trucking was still hampered by the diversity of state laws regarding axle loads and safety devices. Motorbus companies made some additions of equipment of more modern type in the prewar years and so were able to handle a substantially increased business during the war. Private automobile transportation, never important in the long haul, was severely curtailed during the war as a result of gasoline rationing and the shortage of tires. Public transportation within cities continued to follow the trend from streetcar to motorbus. In some cities, however, the shortage of gasoline and tires made it necessary to put streetcars back in use where tracks and overhead wires had not been dismantled. (See also Motor Transportation.)

The pipe-line business made forward strides through the installation of more and better pipe, diesel pumping equipment and telephone dispatching. The most spectacular addition was the building of the "Big Inch" and "Little Inch" pipe lines from the southwest to the east when the German submarines made petroleum transportation by tanker hazardous and uncertain. These lines dropped out of service toward the end of the war and were offered for sale to private companies in 1946. (See Petroleum.)

The Great Lakes carried an unusually large volume of traffic during the war, composed mostly of ore shipments from Minnesota to the lake ports at the southern end of Lake Michigan, Detroit and the Lake Erie ports from Toledo to Buffalo. The locks of Sault Ste. Marie thus became vital transportation links, as was attested by the heavy military defenses set up in the neighbourhood.

The Ohio canal system did a large war business, the number of tons carried increasing almost 60% from 1937–43. Tonnage carried on the New York state system including the Erie canal increased 32% from 1930–40, but dropped off 40% from 1940 through 1943. The Transportation Act of 1940 brought Interstate Commerce commission regulation to the inland waterways. This was a transfer from the maritime commission and brought with it increased regulation consistent with that applied to other domestic transportation. Under this same act, the Interstate Commerce commission received power to regulate inland water rates, to grant certificates of convenience and necessity and to control consolidations and accounts. Significantly it was not given control of securities, safety, or service. (See also Canals and Inland Waterways.)

Air transportation was characterized by the addition of new types of planes and by lower fares. This, along with the war travel, increased the volume of business tremendously. The air express business also increased rapidly, and rates were lowered substantially in 1946. The Civil Aeronautics Act of 1938 imposed important regulations on this segment of the transportation industry; it also set up the Civil Aeronautics authority which, in 1939, became the Civil Aeronautics board. The latter was given power to supervise rates of common carriers by air, to fix maximum hours worked by air employees, to enforce adequate service, to grant certificates of convenience and necessity for new routes, to control accounting practice, and to promote safety. The reconversion period was characterized by a great many applications for new routes. Many of these were made by regional carriers wishing to extend to important terminals; these often paralleled existing service offered by other lines. There were also many applications for foreign routes by companies which did overseas flying on government contract during the war. (See Aviation, Civil.)

The magnitude of the wartime transportation business is indicated by the following figures showing, for five divisions of the transportation industry, the number of billions of tons of freight hauled one mile for the last prewar year and for two war years:

	Railroads	Truck	Great Lakes	Pipe Line	Inland Waterways
1939	335	35	76	50	20
1943	731	46	115	101	26
1014	740	46	119	110	31

Foreign Trade.-U.S. foreign trade in the decade 1937-46 was divided into two major periods: prewar and war. Both periods were characterized by governmental control. În the prewar period, the various credit and exchange controls were a dominant feature. The U.S. was not a party to these agreements as were many of the European governments, but traders of the U.S. who did business with firms in these countries were subjected to the complications accompanying such controls. The major action of the U.S. in the field of control was the execution of reciprocal trade agreements. These agreements provided for the reduction of import duties on the products of countries which agreed to reduce their tariffs on imports from the U.S. Under the tariff act of 1934, the president was allowed to raise or lower tariffs to a maximum of 50%. Twenty-eight reciprocal agreements were made between 1934 and the middle of 1942.

During the war period the foreign trade of the U.S. was substantially altered in quantity, source or destination of shipment, type of product and terms of payment. The index numbers show the volume and value of foreign trade during the decade.

Since World War II automatically closed the axis nations to trade, and axis naval action effectively shut off trade with many neutral nations, the U.S. was forced to seek new sources of certain raw materials or to synthesize them at home. Most of the new sources of supply developed in northern North America and in South America, as shown in Table VI.

The figures in Table VI show only the per cent of total value of imports, which amounted to almost \$2,000,000,000 in 1938, \$2,600,000,000 in 1940 and \$2,700,000,000 in 1942. One must consider the increase in total imports to appreciate the magnitude of the rise and fall in imports from South America. For the continent as a whole, shipments

"Waiting for the New Year." Fitzpatrick's cartoon in the St. Louis Post-Dispatch symbolized the slow-down in the national economy toward the close of 1945, as business men awaited the tax repeal on excess profits which became effective on Jan. 1, 1946

to the U.S. increased 70% from 1938-42. Four countries—Argentina, Bolivia, Chile and Uruguay—more than tripled their shipments to the U.S. These countries continued, as before the war, to ship mostly raw materials. The decreased imports from Europe represented a decrease in the importation of manufactured goods. Thus the over-all picture of imports showed a shift from manufactured goods to raw materials.

As early as 1939 the U.S. government embarked upon a program of stockpiling certain critical materials not produced at home. Under this program, substantial quantities of rubber, tin, quinine, block mica, Manila fibre, and more than 250 other items were imported and stored. By the end of the war the stockpiling program had been reduced to about a dozen items. With both the United Kingdom and the U.S. needing the same raw materials from the world market, there was a possibility that the two nations might bid against one another in an effort to get what supplies were available and thereby increase the prices substantially. To avoid this, the Combined Raw Materials board was established in 1942. Its function was to allocate critical raw materials between the two nations. In the U.S. it controlled the import of many such critical items and limited the imports to public purchases.

The export situation was very different. From 1938-42 the total value of exports increased from \$3,000,000,000 in 1938 to \$4,000,000,000 in 1940 and to more than \$8,000,000,000 in 1942. Table VII shows the destination of these shipments:

Table VII.—Destination of U.S. Exports by Continent

	Per cent of total value
	1938 1940 1942
Northern North America	15.4 18.0 16.9
Southern North America	
South America	
Europe	
United Kingdom	16.8 25.2 31.3
U.S.S.R	
Asia	16.7 15.4 8.5
Oceania	
Africa	3.8 4.0 10.1

The drop in the percentage of total shipments to South America did not imply that South America received fewer goods. On the contrary, shipments to that continent increased 25% from 1938–42. Otherwise, almost all increases in shipments were directly related to the war effort. The type of product shipped changed substantially. Unmanufactured items dropped substantially and manufactures in both semifinished and finished stages increased.

In March 1941 congress passed the act authorizing lend-lease shipments to the Allies. Sixty-one per cent of the total exports of the U.S. in 1942 were under the lend-lease act. By 1944 this percentage had risen to 80. Between March 1941, when the act was passed, and the end of the war in 1945, more than \$41,000,000,000 worth of goods and services passed to the Allies under the provisions of this act. Twenty-one billion dollars of this amount consisted of ships and munitions, \$8,500,000,000 of industrial materials and products, \$6,000,000,000 of foods and more than \$4,000,000,000,000 of services.

The problems involved in meeting the lend-lease needs of the Allies, particularly Great Britain and the U.S.S.R., were unparalleled. It was necessary to provide additional plant capacity and to train workers and supervisors. The machines needed by the Allies were not only complex but were often of different design from those used in the U.S., and those made for nations other than England had to be based on metric measurements. Added to such difficulties

was the fact that all countries found themselves short of essentially the same materials. In the early stages of the war, the U.S. shipped many critical items to the United Kingdom and the U.S.S.R. as rapidly as they could be produced, even though they were in short supply at home. These countries had lost much of their productive capacity in the early successes of the German armies, and the critical items were necessary to keep their industrial system in balance. It was felt that such shipments at that time would enable them to hold Germany back until the U.S. could get into full production. The need for the supplies for lend-lease shipment was so vast that, to ensure their availability, the War Production board was made responsible for their production. Lend-lease thus became one of the prime claimants along with the army and navy for materials under the Controlled Materials plan.

In addition to the exports under lend-lease there was also a substantial quantity of reverse lend-lease after 1942. This arose primarily through the furnishing of food and materials to the armed forces of the U.S. which were stationed in the United Kingdom, Australia and other countries.

By the middle of 1946, agreements had been made with Great Britain and Turkey regarding the settlement of the net balances under lend-lease. Turkey agreed to pay to the U.S. within 30 days \$4,500,000 in final settlement for goods of a civilian nature which had originally cost about 30% more. Military equipment in Turkish hands was not paid for. The U.S. retained the right to recapture such equipment, but it was generally understood that it would not be done. The British agreement was substantially similar, except that the \$650,000,000 payment was to be made in 50 annual instalments beginning Dec. 31, 1951, with interest at 2%. This agreement was considerably more complicated than that with Turkey primarily because of the reciprocal balances and the various military bases and other installations around the world in which the two nations had a joint interest.

In the first year after the war there were still a few shipments previously contracted for under lend-lease but now paid for under a different arrangement. Foreign trade on the prewar pattern was proving difficult to reestablish because of credit and exchange difficulties and because the conquered nations were still under strict control. The major foreign movement of goods was shipped under the United Nations Relief and Rehabilitation administration. These goods consisted mostly of food and capital equipment to bring the economy of the distressed nations up to the point where they could supply themselves with the goods necessary for a minimum standard of living.

British Commonwealth and Europe

The Prewar Years.—The decade opened with many indications of a setback in business in most countries. Rearmament was as yet on too small a scale, except in Germany where it had long been in full swing, to be a major factor in the situation. In Great Britain there was evidence of speculative overtrading in several secondary

commodities (pepper, shellac, peanuts) leading to minor crises in the particular markets concerned. There was also a setback on the London stock exchange, caused by fears of a lower U.S. buying price for gold, and it produced an adverse psychological effect on business. During the last quarter of 1937 there were indications of a setback of a more general nature. Trade indices for the whole of 1937 were, however, generally favourable. Wholesale prices had risen, average unemployment for the whole year had declined to 1,283,523 compared with 1,507,979 in 1936, and the volume of foreign trade advanced from $f_{1,227,-}$ 000,000 to £1,474,000,000. The figures for most European countries and for British dominions showed a similar trend. In Canada the index of industrial production rose by 10%. In Australia unemployment declined from 12.2% to 9.3%, while the employment index advanced from 109.4 to 115.6. In New Zealand the employment index rose from 115.7 to 122.9. There was a marked increase of employment approaching 10% in some instances, in most continental countries during the greater part of 1937. In so far as index numbers of production were published, they showed noteworthy gains. Foreign trade, too, expanded to a considerable degree, even though in central and southeastern Europe this was largely due to the heavy purchases which Germany made against payment in frozen

It was in the last quarter of 1937 and more especially in 1938 that the effect of the trade recession began to show in the statistics. Although rearmament had gathered momentum during the greater part of the year this factor was not important enough to arrest the trade recession. Industrial output, railway traffic and other indices of business prosperity showed a marked downward trend in Great Britain until the late summer. Armament industries were unable to absorb all the workers released from such industries as had to curtail their activity, and the rising trend of unemployment persisted throughout the year. Other industrial countries in Europe showed the same unfavourable tendencies, with the exception of Germany, where industries continued to work to the limit of capacity because of the nazi rearmament drive, and France where stabilization of the franc by Paul Reynaud, after many previous unsuccessful attempts, inspired confidence and led to an all-round improvement. Railway receipts, industrial output, the use of electric power, all showed an upward trend. In Germany the only difficulty was a shortage of labour and occasional local shortages of raw material.

European countries producing raw materials were on the face of it in a more favourable position, since German demand for their products ensured them a steady market. During 1938, however, the difficulty of obtaining payment from Germany was becoming increasingly evident, frozen reichsmark balances grew in volume and the governments concerned were gravely preoccupied by the problem they presented. Most of them were unable to check this increase through a curtailment of exports to Germany, since by then they had become economically dependent on German purchases for their prosperity.

In Canada industrial employment declined, and the index of industrial production fell by 10% compared with 1937. Both imports and exports showed considerable declines. The same was true in the case of New Zealand, where the government was forced to introduce a system of licensing imports and exports, and the statutory obligation of the reserve bank to convert its notes into sterling was suspended. In Australia, too, the trade balance was adversely affected even though the industrial employment index showed an increase for the year. A particularly

heavy fall occurred in India's exports. In South Africa, too, exports, other than gold exports, showed a marked decline.

At the beginning of 1939 the unfavourable trend continued. Unemployment rose sharply in Great Britain. The threat of imminent war depressed business, and at that stage this factor far more than offset the increased activity resulting from rearmament. Outside Germany arms industries even in 1939 represented a relatively insignificant fraction of total business activity. During the early part of 1939 coal, pig iron and steel output figures in Great Britain fell considerably short of the corresponding figures of a year earlier. The decline of wholesale prices continued till the spring. Foreign trade, too, continued to decline. Unemployment fell sharply, however, from February onward.

In most industrial countries of the continent unemployment during the opening months of 1939 was higher than during the corresponding period of 1938. Although iron and steel output in Sweden, Belgium and other countries began to increase under the influence of rearmament, conditions on the whole remained far from prosperous.

In the British dominions the demand for food and raw materials was slow to recover. The recession may be said to have come to a halt during the spring of 1939, but there were no indications of any pronounced recovery during the last prewar months. Some improvement in prices resulted from eleventh-hour purchases of raw materials by Germany and, to a smaller extent, by other potential belligerent countries, for the purpose of building up war reserves.

To sum up thus far, the business history of the last three prewar years was characterized by the threat of a slump, accentuated by political uncertainty, but moderated and eventually arrested by the rearmament drive and other measures taken in preparation for World War II. While conditions in 1937-39 were considerably less prosperous than during the immediately preceding years, the extent of the setback was nowhere sufficiently pronounced to make this period one of trade depression. But for the inadequacy of the rearmament drive in the democratic countries it might have been possible to arrest the recession at a much earlier phase, if not to avoid it altogether. However, neither Great Britain nor France, still less so the dominions or the smaller continental countries would in advance of war convert their peacetime production for war requirements. While better use was made of the capacity of the existing arms industries than at any time since 1918, there was relatively little expansion of munition plants or erection of new arms factories.

The Period of Conversion.-The same reluctance to switch over from civilian production to arms production continued to characterize the countries under review during the early period of World War II, in particular during the so-called "phony war." There was some reason to believe that the governments of Neville Chamberlain in England and Edouard Daladier in France had not given up the hope that it would be possible to negotiate a peace with Germany before any serious fighting developed. This was no doubt the reason why during the first eight months of World War II the conversion of industries for war requirements in Great Britain and France proceeded at a snaillike pace. The continental democratic countries and the dominions took their lead from Great Britain, and their industrial war effort was also slow in getting into its stride.

At the same time, the outbreak of World War II completely disorganized normal business. Activity declined in the building industry and in various other branches of civilian production, in view of the uncertain future. In several countries the result was a net increase in unemployment, despite the acceleration of rearmament and the calling up of large numbers of men for military service. Thus, the number of unemployed in Belgium increased abruptly by 33,000 in Sept. 1939. Foreign trade was affected to a particularly high degree. Shipping became totally disorganized and the Allied blockade interfered with the import trade of the continental neutrals. The effect of the war on seaborne trade, paralyzing at first, was subsequently mitigated by new trade agreements concluded between Great Britain and neutral countries. Even so, foreign trade showed strongly abnormal features. They became increasingly so as World War II gradually affected the raw material and labour position. The immediate effect was a reduction in British imports from £84,100,000 in August to £52,100,000 in September, while British exports fell from £38,500,000 to £23,400,000. By the end of the year, however, a partial recovery occurred in both imports and exports. The figures of the other European countries and of British dominions disclosed similar tendencies.

Prices assumed an upward trend everywhere, particularly in Great Britain and the countries of the sterling area, as a result of the devaluation of sterling by 20% at the beginning of World War II. However, a large measure of price control was introduced in many countries, and some essential supplies were rationed. The rising trend encouraged production, and was largely responsible for a recovery in civilian production from the slump it experienced immediately after the outbreak of World War II. The rise in wages and in the cost of living lagged far behind that of wholesale prices, thus promising fair prospects of profit. Nor was taxation prohibitive at the beginning. Among the continental neutrals the expectation was not unreasonable that the experience of World War I, during which neutrals made vast profits, would repeat itself. There was, in fact, ample opportunity for making profits on the sale of supplies to both sides, as Germany and Great Britain endeavoured to outbid each other for any stocks of food or raw materials available in any part of the continent. Pre-emptive purchases, aimed primarily at depriving the axis of supplies from neutral countries. became one of the principal weapons of British economic warfare. The result of such competitive non-commercial bidding by both opponents was a marked rise in the price of many commodities.

Allowing for all the above factors, the contrast between peace trade and war trade was nevertheless not so pronounced as might have been expected. With the lessons of World War I at their disposal, the belligerents were able to introduce at the very outset measures of war economy which had been adopted only at an advanced stage of World War I. Even so, trade was relatively slow in adapting itself to war conditions. "Business as usual" was a popular slogan, and indeed, after the business world in Britain, France and elsewhere had recovered from the first shock, it made an effort to carry on as normally as possible. With the exception of Germany, where business had practically been on a war footing even before Sept. 1939, there was little indication among either belligerents or neutrals of any feverish adaptation of business to wartime conditions. In France, because of the large size of the mobilized army, a shortage of labour soon developed, and

manufacturers and merchants tried to fill the gap by drawing on reserves of inferior labour. But in other democratic countries of Europe, and in British dominions, most people carried on in their peacetime jobs, doing more or less their peacetime work.

Very little was done during the opening months of 1940 to speed up adaptation to wartime requirements. In Britain, the government was engaged in lengthy negotiations with aircraft manufacturers who wished to protect their position after the war when newly built works would become redundant. This attitude was characteristic not only of Britain but also of other democratic countries. Thus, business conditions early in 1940 showed no fundamental change from those prevailing toward the end of 1939. The effect of the blockade on German trade was negligible. There were innumerable loopholes which allowed Germany to import anything it was able to buy abroad, and it was equally able to secure the means of paying for its purchases by exports shipped in circumvention of Allied control.

It was not until after the German occupation of northern and western Europe that business conditions in Europe underwent a fundamental change. In Great Britain, the change of government and the collapse of France inspired at last a real effort to convert the whole economy to war production. Peacetime public works were suspended, in order to concentrate all available labour on war production. In spite of this, the mobilization of Britain's economic war potential made but slow headway. Government departments were not adequately equipped to cope with the immense additional work resulting from the regulation of practically the entire business life of the country. Officials were reluctant to take decisions which constituted a departure from their routine. A situation developed in which business men, to an increasing extent, came to depend on government orders and instructions for the maintenance of their activity; yet these orders and instructions were slow in coming because of official "red tape" and the initial confusion created by the suddenness of the change. This state of affairs existed also in the dominions even though to a smaller degree.

However, unemployment fell by one half in Great Britain and also in Canada during 1940. In Great Britain this was the result of calling up many hundreds of thousands of men and women for military service and civil defense, rather than of an increased volume of production. There was no corresponding decline in unemployment in Australia and New Zealand. It became increasingly difficult to judge business conditions by the usual indices, most of which became hopelessly distorted by the incidence of abnormal factors. Thus an increase in note circulation or bank deposits, for instance, merely indicated a certain degree of inflation caused by methods of war finance and not an increased volume of business. Special arrangements had indeed been made in most countries for the automatic grant of facilities for financing government contracts which gradually increased in relative importance.

Business in Continental Europe.—On the continent business conditions came to depend on direct or indirect German control in all but a few countries. The economies of the occupied countries were gradually adapted to Germany's war requirements. In many instances German interests acquired direct or indirect financial control of many industrial and commercial firms. But even without such control the occupying power was in a position to impose its will on the business communities of the conquered countries. A German request for conversion to arms production amounted to a command. The vast purchasing

power secured by German conquest and exercised by German occupation troops or the German government was used for the purchase of most things that were worth buying. This led to a sharp rise in prices since the occupied countries were rapidly depleted of their supplies of consumers' goods. Although after their defeat they were supposed to be out of the war, in practice, Germany forced them to continue their supplies.

Business in countries or territories not actually occupied by Germany but following within its orbit was affected in a similar way. In the unoccupied part of France political and economic pressure was used to make industrialists comply with German requirements. The import of raw materials and fuel into the unoccupied zone depended on Germany. It was therefore able to dictate the terms under which firms in "Vichy" France were able to keep their works going. In the Danube countries Germany's economic stranglehold which had already been very strong before World War II became overwhelming after the collapse of France.

Among neutrals, business conditions were also affected by the changed situation. Germany did its utmost to fit their economies into the planned "new economic order of Europe." Sweden and Switzerland for their foreign trade came to be almost entirely dependent on Germany and its satellites. They had to adapt their production to a large degree to the changed situation. At the same time, their industries had to provide for the increased demands of their national defense, for both countries prepared themselves to defend their neutrality should this become necessary. In Switzerland, the industrial employment index, after a moderate decline before World War II, showed a sharp rise during the first four war years. In Sweden, the trend was similar though less pronounced. The foreign trade of both countries also showed a steady increase in value, though this for the most part reflected the rise in prices.

Period of Full War Economy.—The date at which the conversion to war economy was complete in any European country or in the British commonwealth was difficult to define. By about 1943 Great Britain and the dominions had more or less attained the limit of their economic war effort. Their production had been converted to the requirements of national defense. In Australia, the index of industrial employment rose from 125.5 in 1939 to 171 in 1943. In New Zealand there was a rise from 124.1 in 1938 to 141 in 1941. Unemployment in Great Britain itself had been reduced to a negligible number of unemployables. As a result of the economic war effort and the shipping situation, and also, to some extent, of the limiting conditions attached to the lend-lease agreement with the U.S., British export trade declined in value from £470,800,000 in 1938 to £232,800,000 in 1943, in spite of the sharp rise in prices. To a very large extent, foreign trade, especially import trade, passed into government hands.

During the period of transition from a peace to a war economy, an elaborate system of rationing and other restrictions was built up. Great Britain's manpower and womanpower came to be mobilized to an extent that compelled reluctant admiration even on the part of the German leaders who sought to hold out the British example as an inspiration to the German economic war effort. The government became the largest employer of industrial labour, and the majority of private employers also worked for government account. The scope for individual initiative in business had narrowed down considerably. Individual firms either worked on government contracts or

produced approved goods for which the government allocated raw material and labour. Production itself became standardized as a result of the official adoption of "utility" types. Merchants largely sold rationed goods, or goods subject to price control.

On the continent, the German occupying power sought to enforce similar discipline on business. Even though, there, noncompliance with orders and regulations was subject to much more drastic penalties than in Great Britain, the extent to which German efforts succeeded was considerably smaller than in Great Britain. In France and in the other occupied countries of western and northern Europe black market dealings assumed very considerable proportions, and overshadowed in importance the volume of transactions at official market prices. This was due in part to the inflationary effect of German methods of exploitation as a result of which there was a strong upward trend of prices. But the main reason was that farmers and other producers in occupied countries considered that it was not only to their interest, but that it was also their duty to divert from official channels as much of their goods as possible. Indeed the more goods reaching the official market, the more would be available for the occupying authorities to divert toward the satisfaction of German requirements. Thus, while in Great Britain all public spirited citizens complied with price control and other restriction measures even though these were against their individual interests, in German-occupied Europe patriotic considerations worked in the opposite sense. Manufacturers in occupied countries found it, of course, much more difficult to divert their output from official channels. They too, endeavoured, however, to keep down to a minimum their deliveries to Germany to avoid, among other reasons, being branded as collaborators with the axis. On the other hand, they had to comply to a considerable extent with German demands, in order to be able to keep their works going and save their workmen from being transferred to Germany as slave labour.

While in Great Britain high taxation absorbed most of the business profits made during World War II, in German-occupied countries taxation was not so high, and in any case black market transactions escaped it altogether. As a result, large fortunes were made, partly through deliveries to Germany, which were paid generously with the money the occupied countries were compelled to provide, and partly through black market operations. In any case rising prices by themselves produced substantial capital appreciations, even though these were largely a mere book profit.

Both in Great Britain and on the continent merchants were able to dispose of their prewar stocks, and carried much smaller stock in trade than in normal conditions. As a result, they were able to pay off their bank debts and had substantial cash balances because of the difficulty of replenishing their supplies. Thus, the extent to which banks were called upon to finance business (other than government contracts) was materially reduced. To an increasing degree banks became the bankers of government ingead of the bankers of business.

In the British dominions, too, business conditions had fully adapted themselves to the requirements of World War II by 1942-43. During the concluding years of the war, Canada, Australia and South Africa steadily maintained industrial production at the peak levels achieved. Under the pressure of wartime requirements India made spectacular progress toward industrialization. There the

great difficulty was to moderate the sharp rise in prices caused by the shortage of supplies, the inflation of the purchasing power of the masses and the inadequate degree of saving in any form other than the hoarding of gold and silver coins. In order to reduce the hoarding of goods, the British authorities had to sell large quantities of precious metals to the Indian public. Even so, shortage and maldistribution of supplies resulted in acute famine.

A factor which increasingly affected business conditions in Great Britain, Australia and other countries of the British commonwealth was the expenditure of the United States forces stationed there pending the attack to be launched on Germany and Japan. It produced a substantial additional demand and led in many instances to a rapid depletion of the dwindling supplies of goods. At the same time it provided an important source of profit to the firms and the governments of the countries concerned.

Last Phase of the War.—During the concluding period of World War II the European neutrals grew increasingly prosperous as a result of their trade with the belligerent countries. To a large extent, however, such trade was paid for by merely adding to the frozen reichsmark claims of the exporting country. This did not, however, affect the exporters themselves, since they had their frozen balances discounted or otherwise "mobilized" by their respective monetary authorities. The system of the Allied "black lists" which placed under boycott neutral firms trading with the axis became gradually more effective as a deterrent, as and when Allied victory became increasingly certain. Many firms preferred to renounce profitable business with Germany rather than expose themselves to the postwar effects of such a ban. Generally speaking, however, Sweden, Switzerland, Spain and Portugal were doing brisk trade with Germany. In Portugal and Spain the prices of some raw materials were driven to fantastic levels as a result of competitive bidding by German and Allied agents. There was a sharp rise of prices during the concluding phases of World War II, especially in Switzerland and Spain due partly to increased purchasing power and partly to scarcity of supplies. In the same way as in belligerent countries, unemployment virtually ceased, and scarcity of labour entailed a sharp rise in wages.

During the concluding years of World War II the main characteristics of business in all Allied and neutral countries under review were the achievement and maintenance of production up to the limit of physical capacity; scarcity of labour and many raw materials; an insatiable demand for goods due to the inflated purchasing power of large sections of the public; the vastly increased role of government in the sphere of business, both as a buyer of manufactures on a large scale and as a regulator of business relations between private parties; and a strong rising trend of prices which, however, was successfully kept under control in a number of countries.

In Germany the iron discipline imposed on business life by the nazi regime continued to prevail to some extent right up to the collapse. The system described by German authors as "static inflation," under which the powerful forces making for a sharp rise of prices were suppressed by measures of control, was becoming, however, increasingly difficult to maintain. Allied air bombing began to affect the capacity of the nation to produce, to pay taxes and to save. The government found it difficult to prevent the development of a vast black market. While prices were effectively controlled almost to the last, many people became increasingly reluctant to sell and preferred

to barter their possessions. The necessity of providing for the indispensable minimum requirements of the population in districts destroyed by air raids, and the disorganization of production and transport by these raids, put the well-established system of rationing to a very severe test. At a later phase business became completely disorganized by Allied invasion in the east and west and in particular by the large-scale flight of the population from the eastern zone of Germany.

In Italy, the slow progress of the Allied invasion resulted in the division of the country into two separate economies, the dividing line being the fighting front, beyond which the German authorities assumed full control. In the southern districts under Allied occupation prices rose sharply as a result of the temporary disorganization of civil administration. Production came almost to a complete standstill. In the northern districts the German military authorities and the Italian fascist puppet government recklessly inflated the currency. In southern Italy, on the other hand, deliveries of American goods somewhat mitigated the prevailing economic difficulties. Even so, practically all business came to be transacted in black markets.

Reconversion to Peacetime Economy.—The termination of World War II was not so sudden as that of World War I. Because of the continuation of the war in the far east, Great Britain and the British dominions could not start on a general reconversion to peace economy immediately after the defeat of Germany. Even after V-J day the progress of reconversion was slow, partly because of the slowness of demobilization and partly because of the preference of the Socialist regimes in Great Britain, Australia and New Zealand for a controlled economy. A temporary increase of unemployment was inevitable, even though a shortage of labour continued to prevail in most industries. In Great Britain the number of totally unemployed on the register rose from an average of 63,000 in 1944 to 374,000 in May 1945. It had declined to 355,000 by Sept. 1946. The conversion of industries for the production of civilian goods made fair progress in 1946. High prices and the certainty of selling anything that was produced created an atmosphere of prosperity despite the resentment of business over the maintenance of controls and over the anticapitalist attitude of the Labour government. Much of the increased output of civilian goods was diverted to foreign markets, and the volume of exports rose sharply, while the home markets were kept short of many kinds of essential supplies. From £29,600,000 in the first postwar month (Sept. 1945) the value of exports rose to £92,100,000 in Nov. 1946. Imports remained high, especially from the western hemisphere. Prices continued to rise, though not excessively.

The liberated continental countries had to readapt their economies to the prewar territorial position. Already before their liberation their governments, then functioning in London, decided to declare null and void any participations in business firms taken by German nationals or even by neutrals after the outbreak of World War II. The denazification of the liberated countries was thus effected without delay. Their physical and financial reconstruction was a more difficult task. Extensive damage had been caused to industrial plant and means of transport during the fighting in 1944-45, and the rebuilding of essential services was a slow and painful process. Nevertheless, gratifying progress was made during 1946, and in every country the volume of industrial or mining output in certain lines approached and even exceeded prewar level. Thus in Belgium industrial production (1939=100) which was at 24% of its prewar level on V-E day had risen to

1--1----

83% by July 1946. In Denmark the index of industrial output had declined from 81% for 1944 to 65% in July 1945, but recovered to 96% by Oct. 1946. In France industrial output rose from 49% to 73% of prewar level between Aug. 1945 and Sept. 1946. Coal output actually exceeded the prewar level.

Stringent anti-inflation measures taken at an early stage in Belgium led to temporary inconvenience to business,

Table VIII.—Index Numbers of Employment
Basis 1929 = 100

mained intact or even been reinforced, by World War II. They were in a position to export on a large scale, but the problem was to receive payment in the form of imports of goods they needed. Sweden and Switzerland in particular entered the postwar period in very sound conditions.

In Germany, the complete collapse of administrative organization in 1945 resulted in chaotic business conditions. The inflation of the note circulation and the difficulty of buying goods in exchange for banknotes reinforced the development of barter which had begun during the concluding phases of World War II. The devastation of industrial plants, especially in western Germany, left Germany's production system paralyzed, and reconstruction was extremely difficult. In Italy conditions were less unfavourable, even though the depreciating trend of the lira delayed the return of stable business conditions. Germany's former satellites were in a varying state of economic disorganization, the worst case being Hungary.

Notwithstanding the immense difficulties that had yet to be overcome in order to return to normal business conditions in Europe, progress on the whole had been more satisfactory than most people would have dared to expect when hostilities ended.

but in the long run they paved the way toward stability. In France, on the other hand, the depreciating trend of the franc made it extremely difficult for the government to restore anything approaching normal conditions in business. The black markets that developed during the German occupation remained the predominant feature of French economy even after liberation. Prices fluctuated widely, and had a distinctly upward trend. This, together with internal political developments, gave rise to much-industrial unrest. In Greece, business became disorganized through extreme inflation. It proved impossible to achieve stability even after a most drastic devaluation of the drachma.

Neutral countries benefited by the fact that both their system of production and their financial system had re-

Butler, Pierce

Butler (1866–1939), U.S. jurist, was born near St. Paul, Minn. on March 17, 1866, and received his bachelor's degree in 1887 from Carleton college, Northfield, Minn. He was admitted to the Minnesota bar in 1888 and practised law in St. Paul until President Warren G. Harding nominated him associate justice of the U.S. supreme court Nov. 23, 1922; he was confirmed by the senate the next month and took his seat Jan. 2, 1923. He was an outstanding conservative on the supreme court bench, and, although a Democrat, voted consistently to annul legisla-

tion of the New Deal. Justice Butler died at Washington, D.C. on Nov. 16, 1939.

Butter

World trade in butter before 1937 was centred in the United Kingdom and Europe, with far-away New Zealand and Australia participating. The United Kingdom was the principal importer, taking an average of 912,000,000 lb. in 1930-34; Germany was second with a 186,800,000 lb. average. The sources of exports were Denmark, averaging 352,286,000 lb. in 1930-34; New Zealand, 253,300,000 lb.; and Australia, 200,900,000 lb. The United States was taking a balance of imports. World War II cut off the trade of Denmark to Great Britain and shifted it to Germany. The shipments from New Zealand and Australia were reduced, and the burden of supplying Great Britain and the U.S.S.R. fell upon the U.S. and Canada. The total supply of butter entering world trade was estimated to be only about half the prewar average. Danish exports in 1945-46 were only about 180,000,000 lb; New Zealand's were 295,000,000 lb. and Australia's 112,000,000 lb. Supplies were reduced in all war-ravaged Europe as the number of cows was reduced about 25% and the demand for fats became extremely acute. In relief shipments, priority was given to dried and condensed milk over butter, which was not so easy to transport. Other fats were preferred to cream products.

Butter production continued to decline through 1945 and 1946, particularly in the U.S. The Canadian output also was reduced. Denmark and Switzerland alone had an increased milk production as feed supplies increased in 1946 and turned out more butter. The world's principal butter-producing countries in 1945 were: United States, 1,705,000,000 lb.; New Zealand 331,212,000 lb.; Australia 305,852,000 lb.; Canada 293,541,000 lb.; Denmark 291,667,000 lb.; Sweden 207,360,000 lb. All other countries produced less than 100,000,000 lb. Germany was in second place before World War II, producing an average of 792,000,000 lb. 1934–38.

The people in the U.S. drank much of their butter as fat in whole milk during the decade 1937–46. In other words, the great demand for whole milk absorbed much of the increased milk production, leaving less cream for buttermaking. This was not altogether a phenomenon of the war period; butter production had been declining after 1933. Production of farm butter for sale declined from 128,600,000 lb. in 1932 to less than 50,000,000 lb. in 1945, and creamery butter output did not make up the difference. Total U.S. butter production, farm and creamery, averaged 2,170,000,000 lb. during the period 1935–39. The output declined steadily to about 1,450,000,000 lb. in 1946 or to only 67% of the prewar average.

Production of Butter in the U.S., 1937-46

(In pounds)

1939								1944				
1940	٠						2,240,000,000	1945				1,705,000,000
1941							2,268,000,000	1946				1.450.000.000

The Dairy Products Marketing association, an organization of dairy co-operatives, was started in 1938 to support the butter market with government aid. At the outbreak of World War II in 1939, however, butter advanced in price rapidly and the association ceased operations. Stored stocks of butter reached a peak in 1938. Minimum prices for butter were announced by the U.S. government in 1941 and revised upward at various times

until Dec. 1944. At times during 1941 and 1942, prices of butter were below the minimum, and the government made heavy purchases to support the market. The minimum price in April 1941 was 31 cents per lb. at Chicago, Ill., which was raised to 36 cents in March 1942, and to 46 cents in November of the same year. During 1944 the price stood at 46 cents, and the government was pledged to hold the price at 90% of parity for two years following the official end of the war. The average price began to advance in early 1946 and stood at 50 cents when price control lapsed. The price rose to an average of 75 cents in December, then declined suddenly to about 65 cents per pound. The total payments in subsidies amounted to \$41,700,000 in 1943; \$79,900,000 in 1944; and \$55,600,000 in 1945.

The U.S. government reserved 30% of all butter produced after Feb. 1943, of which two-thirds was for the military forces. A large part of the remainder was sent to the U.S.S.R. The shortage of butter for civilians became so acute in Oct. 1943 that the government ceased buying until April 1944. Rationing was begun late in 1943 and checked civilian consumption. Stocks were reduced, and it was estimated that one-fifth of the 1944 production was taken for military and lend-lease uses. Per capita consumption of butter by civilians declined from 16.9 lb. in 1940 to 11 lb. in 1945. At the same time milk production was making a new high record. The increase was absorbed by the increased buying power of consumers as well as the changes in eating habits. Millions of workers were obliged to eat at lunch counters and found whole milk a cheap and convenient form of energy-giving food.

When rationing was terminated in Dec. 1945 and surplus U.S. government stocks were released, a temporary increase in civilian consumption followed, and per capita consumption rose to the prewar rate. Another butter shortage began early in 1946, however, and the total for 1946 was expected to be about the same 11 lb. per capita as in 1945. Creamery butter production in 1945 was the lowest after 1923. The shortage of butter was not caused by a decline in the dairy industry because milk production was high and prices paid dairy farmers for their products were above average in relation to feed costs. Only the shortage of labour and high wages handicapped dairymen.

The fresh milk supplies of the large cities were well maintained, and many communities with greatly increased populations of war workers were supplied by new dairy farms in the vicinity.

The prices of U.S. milk and cream for consumer use continued more favourable to dairymen than did the sale of cream for buttermaking, consequently the buttermaker was the last market to be supplied except in the season of flush milk production in the spring.

U.S. exports of butter had averaged only 1,579,000 lb. in 1931-40, but increased to 99,630,000 lb. in 1943 and then dropped to 32,873,000 lb. in 1945. Exports of natural butter amounted to about 18,000,000 lb., of which 16,400,000 lb. went to the U.S.S.R. Other exports included 4,200,000 lb. of butter oil and 10,800,000 lb. of butter spreads, of which about half went to the U.S.S.R. (See also Cheese; Dairying; Margarine; Milk; Vegetable Oils and Animal Fats.)

Byelorussia

Also known as the White Russian Soviet Socialist Republic, Byelorussia is one of the 16 member states of the soviet union. It is inhabited by the Byelo-Russians or White Russians, a Slav people distinct from the Russians, and forming an ethnic bridge between Russians and Poles. According to the census of 1939, Byelorussia had a population of 5,567,976 on an area of 48,868 sq.mi. Capital: Minsk (pop. 238,772 in 1938); other important cities: (1939) Vitebsk (167,424) and Gomel (144,169). In 1939 the provinces of Poland, where White Russians lived, an area of more than 34,700 sq.mi. with a population of about 4,000,000, were added.

During World War II, White Russia was devastated. At the Yalta conference in Feb. 1945, Pres. Roosevelt agreed to the Russian demand that Byelorussia be recognized as having the status of an "independent" nation and that its delegates would be admitted to the United Nations conference at San Francisco. Byelorussia was represented at the conference by a delegation under Kuzma V. Kiselev, the people's commissar for foreign affairs.

Byrnes, James Francis

Byrnes (1879—), U.S. statesman, lawyer and politician, was born May 2, 1879, in Charleston, S.C., of poor parents. At the age of 14, he left school to work in a law firm as office boy. Later, he became a court reporter. Elected on the Democratic ticket to the U.S. house of representatives, he was re-elected six times, serving from 1911 to 1925. In 1930, he was elected to the U.S. senate and was re-elected in 1936. A New Deal supporter, he was appointed to the supreme court bench in June 1941, but left in Oct. 1942 to head the newly-created Office of Economic Stabilization.

On May 28, 1943, he was appointed director of the Office of War Mobilization. In 1944, he ordered many drastic job controls to siphon off available manpower into war production. He attended the Yalta conference, Feb. 4–11, 1945. Two months later (April 2), he resigned as war mobilization director, asserting that victory in Europe was near and that his main task was completed.

Pres. Harry S. Truman named Byrnes secretary of state on June 30, 1945. Byrnes then accompanied the president to the Potsdam parley (July-August) and participated in the Allied council of foreign ministers (September-October). The latter parley ended in failure; Byrnes asserted that the deadlock resulted from Russian refusal to compromise on procedural matters. However, Big Three unity was recemented at the succeeding parley of British, U.S. and Russian foreign ministers at Moscow in December, where substantial agreement was reached on many issues. Byrnes declared, Dec. 27, that establishment of closer and more cordial relations between the Big Three powers was one of the important achievements of the Moscow conference. However, in early 1946, the administration shifted from what was termed a "soft" to a "hard" policy with regard to the soviet union. Byrnes apparently followed this new "line" at all the important diplomatic gatherings he attended in 1946, which included the U.N. security council sessions in London and New York, the Paris council of foreign ministers (Apr. 25-July 12), the 21 nations

peace conference in Paris (July 29—Oct. 15) and the New York conference of foreign ministers that opened Nov. 4, 1946.

The "hard" policy led to frequent clashes between Byrnes and the soviet delegates, with the latter insisting that the U.S. and Britain were aligned in a "western" bloc of nations and Byrnes denying the existence of such blocs. On several occasions, Pres. Truman reiterated his full approval of Byrnes policy, the first being March 28, 1946, when Truman endorsed his secretary's action in pressing the Iranian dispute in the United Nations. The second was on Sept. 14, when Secretary of Commerce Henry A. Wallace's attack on U.S. foreign policy jeopardized Byrnes' position. Truman then emphasized that there was "no change" in U.S. foreign policy. Following failure of the 21 nations peace conference in Paris, Byrnes asserted that the scant accomplishments were due to a soviet obsession that failure of the great powers to agree would result in inevitable armed conflict. Toward the close of 1946, Byrnes and Bevin signed (Dec. 2) a formal agreement providing for the economic merger of the U.S. and the British occupation zones in Germany.

Cabinet Members, U.S.

Of President Roosevelt's ten original cabinet members appointed in 1933, all but two (William H. Woodin and George H. Dern) were still serving at the beginning of the decade 1937–46. During the course of the decade and until his death, Roosevelt appointed new secretaries of state, war, navy, agriculture and commerce, attorneysgeneral and postmasters-general. At the time of Roosevelt's death, only two of the original members, Harold L. Ickes and Frances Perkins, held their initial posts. The last, Ickes, remained until 1946, when he resigned.

Following is a list of cabinet members under the Roosevelt and Truman administrations, through 1946:

State.—Cordell Hull (1933–44); E. R. Stettinius, Jr. (1944–45); James F. Byrnes (appointed 1945).

War.—George H. Dern (1933–36); Harry H. Woodring (1936–40), Henry L. Stimson (1940–45); Robert P. Patterson (appointed 1945).

Treasury.—William H. Woodin (1933); Henry Morgenthau, Jr. (1934–45); Frederick M. Vinson (1945–46); John W. Snyder (appointed 1946).

Navy.—Claude A. Swanson (1933-40); Charles Edison (1940); Frank Knox (1940-44); James V. Forrestal (appointed 1944).

Attorney-General.—Homer S. Cummings (1933–39); Frank Murphy (1939–40); Robert H. Jackson (1940–41); Francis Biddle (1941–45); Thomas C. Clark (appointed 1945).

Postmaster-General.—James A. Farley (1933–40); Frank C. Walker (1940–45); Robert E. Hannegan (appointed 1945).

Interior.—Harold L. Ickes (1933–46); Julius A. Krug (appointed 1946).

Agriculture.—Henry A. Wallace (1933–40); Claude R. Wickard (1940–45); Clinton P. Anderson (appointed 1945). Commerce.—Daniel C: Roper (1933–38); Harry L. Hopkins (1938–40); Jesse H. Jones (1940–45); Henry A. Wal-

493

lace (1945-46); W. Averell Harriman (appointed 1946). Labour.—Frances Perkins (1933-45); Lewis B. Schwellenbach (appointed 1945).

For British cabinet ministers and other members of the government at various intervals during the decade, see Government Departments and Bureaus; Parliament, Houses of.

Cadmium

Data were lacking during the years of World War II for so many of the important cadmium-producing countries (Belgium, France, Germany, Italy, Norway, Poland, South-West Africa and Great Britain) that it was difficult to judge the trend of output. In 1937 these countries produced nearly one-third the total output. Among the producers for which data were available (Australia, Canada, Mexico and the United States) at the end of the decade 1937-46, output varied with local conditions, but in general increased appreciably. In Australia the 1937 output of 232 short tons dropped to 193 tons in 1939 and 1940, rose to 215 tons in 1941, dropped sharply to 177 tons in 1943 and rose to 284 tons in 1945. Canadian production was 375 tons in 1937 and 626 tons in 1941, declining to 274 tons in 1944, and recovering to 319 tons in 1945. In the U.S., where about one-quarter of the output continued to come from raw material imported from Mexico, production rose from 2,412 tons in 1937 to 4,192 tons in 1945, each year except 1938 showing an increase. The Mexican output remained all in the form of cadmiumbearing flue dust, practically all exported for treatment to the U.S. Production was not recorded and exports were somewhat irregular, depending on current demand; exports varied between a low of 684 tons in 1937 and a high of 1,160 tons in 1945.

Cadmium consumption in the U.S. increased from 3,089 tons in 1940 to about 3,850 tons in 1941 and 1942, and to a high of 4,433 tons in 1944, before dropping back to about the 1942 level in 1945. Although there was some variation from year to year depending on current demand in other lines, about 70% of the total was used in electroplated rustproof coatings, much of which was applied to war material. Unspecified uses in 1944 called for 975 tons and in 1945 for 150 tons, some of which was possibly used in the plants producing plutonium for atomic bombs.

Cadogan, Sir Alexander George Montagu

Sir Alexander Cadogan (1884—), British diplomat and statesman, was born Nov. 25, 1884, youngest son of the 5th earl of Cadogan. He was educated at Eton and Oxford university and later entered Britain's diplomatic service. He held a number of minor posts in British embassies up to and during World War I. He was made a foreign office counsellor in 1928 and was knighted in 1934. From 1933 to 1935, he was envoy extraordinary and minister plenipotentiary to China and in 1935, when the Chinese legation was raised to the status of an embassy, Sir Alexander became the British ambassador to China.

He was recalled to London in 1936 to become deputy undersecretary of state for foreign affairs, and in 1938 he succeeded Sir Robert Vansittart as permanent secretary. During World War II, he accompanied Churchill, Eden and other British cabinet members to various conferences with other Allied leaders. With Sumner Welles (then U.S. undersecretary of state), Cadogan drafted the Atlantic Charter in the summer of 1941.

In 1944, Sir Alexander headed the British delegation to the Dumbarton Oaks conference. He attended the United Nations conferences in San Francisco in 1945 and on Jan. 31, 1946, the British government announced that he had been chosen permanent British representative on the U.N. security council.

Caggiano, Antonio

Cardinal Caggiano (1889—), Argentine prelate, was born Jan. 30, 1889, at Coronda, Santa Fé province, Argentina. Educated at the Colegio de la Immaculada and Santa Fé seminary, he also studied at the Latin-American Pian college at Rome and was ordained to the priesthood in 1912. He was named bishop of Rosario in 1935 and then taught philosophy and science at the Santa Fé seminary. He later returned to Rome, studied the organization procedures of the Catholic Action and was appointed general ecclesiastical counsellor of the Argentine Catholic Action. Caggiano was largely instrumental in fostering the growth of Catholic Action in Argentina, Uruguay and Paraguay. He was created a cardinal at the consistory ceremonies in Vatican City, Feb. 18, 1946.

Cairo Conference (1943)

Calcutta

The affairs of Calcutta-second largest city in the British empire-continued to be managed by a corporation consisting of a mayor, a deputy mayor, an executive officer, 5 aldermen and 80 councillors, with elections triennial. Not only in the matter of increase in the number of elected representatives was the constitution made more democratic, but the franchise also was lowered, women made eligible for election, and special representation was afforded for Mohammedans, the scheduled classes, Anglo-Indians and Labour. Voting continued to be by ballot. Special powers were given to the corporation for maintaining municipal cowsheds and improving the milk supply. The law relating to food and drugs was made more explicit. Licensed building surveyors were appointed, and power was given to the corporation to refuse to sanction building plans unless prepared by a licensed surveyor. The improvement trust was responsible for opening up congested areas, laying out streets and providing open spaces. The port trust of 20 members managed all matters relating to shipping.

The population of Calcutta, estimated in 1937 at 1,485,500, was 2,108,891 at the 1941 census. Until the closing of the schools because of air raid threats in 1942, the corporation maintained 234 free primary schools, including 5 night schools for carters and sweepers. There were 20 free hospitals and dispensaries. The birth and death rate, 10.5 and 27.7 per 1,000 respectively, were exceptionally low for India. The most comprehensive engineering scheme of the decade was the Kulti outfall drainage scheme, which was by 1946 practically complete.

The declaration of war by Japan and the advance of the Japanese to the Assam border brought Calcutta into the front line. The city was an advanced base for supplies going to the front; it was crowded with U.S., British and Indian troops, and during the retreat from Burma, with multi-

tudes of refugees who had evacuated the country and arrived destitute and in a pitiable condition. Voluntary societies, largely run by British and Indian women, worked indefatigably to cope with the situation. The threat of bombing necessitated the raising of A.R.P. services and the erection of shelters. Calcutta had its first air raid on Dec. 20, 1942, and another on Jan. 6, 1943, when three planes were brought down. After this there was no raid for nearly a year. Casualties were light and there was no panic.

In Dec. 1942, owing to the disastrous Bengal famine, starving peasants started to arrive in the city in large numbers, and strenuous efforts were necessary to avoid the outbreak of an epidemic. Free kitchens and dispensaries were opened, and camps were erected outside the city, but the mortality was very high and the hospitals were overflowing. The famine was checked after the personal intervention of the viceroy, Lord Wavell, with the co-operation of the military authorities. Calcutta suffered heavily during the communal rioting following the declaration of "direct action day" by the Moslem league on Aug. 6, 1946. There were many casualties and the destruction of property was extensive. Many shops were looted, and tramcars and omnibuses were set on fire.

California

The most southerly of the Pacific coast states, popularly known as the "Golden State," California was the 31st to enter the union (Sept. 9, 1850). Area: 158,693 sq.mi., of which 1,890 sq.mi. is water. Pop. (1945 estimate) 8,842,700; in the 1940 census it was 6,907,387. Capital, Sacramento (105,958). Other cities: Los Angeles (1,504,277); San Francisco (634,536); Oakland (302,163); San Diego (203,341); Long Beach (164,271); Berkeley (85,547); Glendale (82,582); Pasadena (81,864). All these cities had large increases in population during World War II.

Important legislative acts during 1937 provided for liberalization of the old-age pension law, substitution of lethal gas for hanging as a means of capital punishment, and establishment of a retirement system for judges. In a special election, Albert J. Elliott was elected to succeed Henry Stubbs as representative of the 10th congressional district. An important development in municipal politics was the election of Frank L. Shaw to the Los Angeles mayoralty. A year-long graft investigation in San Francisco resulted in the resignation of all members of the police commission and ousting of many police officers.

Widespread labour unrest severely handicapped California industry during 1937. Most protracted and costly was the strike of 40,000 San Francisco maritime workers, which tied up shipping for 98 days. Violence and bloodshed marked a strike in the canning industry which was ended in November by an agreement involving 96 canneries and unions representing 70,000 workers. Important strikes also affected San Francisco hotels, the motion picture and automobile industries and certain aircraft factories. Inter-union controversy, affecting the entire Pacific coast area, reflected labour unrest during the latter half of the year.

A reaction against the conservative administration of Governor Frank F. Merriam (Rep.) swept left-wing Demo-

crats into the major state offices in the 1938 elections. Bidding for the liberal vote by promises of a pardon for Thomas J. Mooney and a self-help, co-operative program for unemployment relief, Culbert L. Olson decisively defeated Merriam, to become California's first successful Democratic gubernatorial candidate in 44 years. For U.S. senator, Sheridan Downey, running mate of Upton Sinclair in the 1934 EPIC (End Poverty in California) campaign, won the Democratic nomination from the Roosevelt-endorsed incumbent and scored an impressive victory over the Republican nominee. The Democrats maintained their majority in the state legislature's assembly, the Republicans theirs in the senate. The pension plan, which gained nation-wide notoriety as the "Ham and Eggs for California" program, and bills seeking to restrict labour activities and institute the "single tax" were defeated.

In Los Angeles, a reform party succeeded in ousting Mayor L. Shaw in a special election held in Sept. 1938. Many changes in city personnel were instituted by Shaw's successor, Fletcher Bowron. Labour strife was less extensive, although San Francisco warehouses and department stores were involved in serious labour controversies.

Throughout a record-breaking session of 133 days in 1939, the legislature consistently opposed the liberal program of Governor Culbert L. Olson. Olson's budget was reduced by some \$91,000,000, although the final amount, \$468,071,624 for the 1939–41 biennium, was still the largest budget in state history. Despite the mounting deficit, the legislature also rejected the governor's entire tax program, except for a tax on gifts.

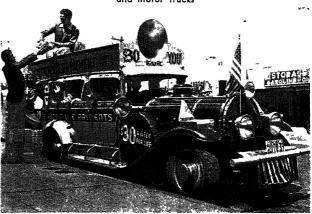

In a special election in November the "Thirty Dollars Every Thursday" pension scheme was repudiated by the voters.

Labour disturbances continued in the maritime industry in 1939, particularly in San Francisco, and in November culminated in a general longshoremen's strike which lasted for 53 days. Deportation hearings in the Harry Bridges case and the pardon of Thomas J. Mooney were other events on the labour front.

The legislature convened for five special sessions in 1940, primarily to consider additional relief measures. A bill excluding Communist party candidates from the state ballot was also approved by both the legislature and Governor Olson.

Three state-wide elections were held in 1940. The thirdterm issue split Democratic ranks in the presidential pri-

"Thirty Dollars Every Thursday," the slogan of an old-age pension plan rejected by voters of California Nov. 8, 1938. Campaigning by many hundreds of workers was carried on from public platforms and motor trucks

maries, with the Olson-sponsored Roosevelt delegation winning over three other groups. In the November general election the state cast a record vote of 3,300,410 distributed as follows: Roosevelt, 1,877,618; Willkie, 1,351,419; Thomas, 16,506; Browder, 13,586; Babson, 9,400. In the U.S. senatorial election the figures were: Hiram Johnson, 2,238,899; Fred Dyster (Prohibition), 366,044; Anita Whitney (Communist), 97,478; scattering, 11,439. Eleven Democrats and nine Republicans were elected to congress.

Under the stimulus of the national defense program, unprecedented industrial expansion took place in the state during 1941. National defense highlighted the regular session of the legislature, which created a 30-man council to co-ordinate defense preparations of state and local government, approved legislation penalizing sabotage and subversive activities, and established a program designed to forestall disruption of economy by labour disturbances. An act outlawing secondary boycotts was passed over the veto of Gov. Olson. A special session called to finance defense preparations granted only \$1,000,000 of the \$10,000.000 requested for the governor's emergency fund, but appointed a committee to study defense needs in preparation for further appropriations. (C. E. Ch.; R. H. Sh.; X.)

A Japanese submarine shelled oil fields at Ellwood on Feb. 23, 1942, and blackouts in coastal cities took place on several occasions. All Japanese (approx. 95,000) were ordered removed from the coastal zone by the commander of the western defense area. Other defense measures included dimming of lights visible at sea and a general dimout within a 50-mi. wide zone along the coast.

In the general election in Nov. 1942, Governor Olson lost to Earl Warren (Rep.) in an election in which 2,264,288 votes were cast. The lieutenant governor and secretary of state chosen were both Republicans. The Republicans also won a majority in both houses of the legislature. The electors approved an anti-hot cargo initiative measure, and defeated a proposal to repeal the state income tax.

Governor Warren's program included a tax reduction, a state guard program which abolished the militia plan in force, formation of a state war council representing the state, city and county governments, a postwar planning council to cope with the postwar unemployment problem, and a food and fibre council, created to meet agricultural problems. Clashes between service men and so-called "zoot suit" gangs in Los Angeles and riots at the Japanese relocation camp at Tulelake were two incidents related to war conditions during 1943. California was the leading state in ship and plane production (9.9% of the total output). On Aug. 16, 1943, the state's first steel mill (erected by Henry Kaiser at Fontana) started operation.

In 1944, Gov. Earl Warren delivered the keynote speech at the Republican National convention in Chicago in July, and was mentioned as a possible vice presidential candidate. In the national election in November, Roosevelt received a vote of 1,988,564 as against 1,512,965 for Dewey. In the senatorial race, Downey, the incumbent, won over Republican Frederick Houser. In a special session in January the legislature enacted a measure combining.

State expenditure . . . Number of banks . . .

Number of national banks

bining August and May primary elections for the war period, established a new administrative system for state penal institutions and authorized taxation of federally-owned property whenever consent should be given by the national government. A later session considered a teacher's retirement act and additions to the program planned to meet postwar unemployment.

In Dec. 1944, the war department authorized the return of loyal U.S. citizens of Japanese ancestry to the coast. An explosion of ammunition vessels at Port Chicago in July cost the lives of 321 persons and extensive property damage. The state continued as a heavy producer of ships and planes and remained in the "No. 1 critical" classification under manpower regulations.

In May and June 1945, attention was focused upon San Francisco when United Nations delegates met there to plan for a permanent world organization. On June 19 the legislature ended the longest session in its history. A war council created to deal with invasion emergencies was abolished and its responsibilities assigned to a disaster council, and a war catastrophe fund of \$25,000,000 was unfrozen for other uses. Unemployment insurance provisions were liberalized, a committee was set up to study a plan for prepaid medical care through a system of compulsory health insurance, \$15,000,000 was voted for improvement and maintenance of state park and beach facilities, salaries of state employees were increased, tax reductions established in 1943 were continued, and the exemption base for income tax was broadened.

The housing situation became more acute as the war shifted to the Pacific and was heightened after its termination because west coast ports became congested with returning servicemen and their families. Some industries were affected by labour unrest, with the greatest publicity being given to strikes in the movie industry. The return of Japanese residents, after restrictions were lifted in Dec. 1944, was marked by violence, and the opposition to their return was such that many preferred to settle elsewhere.

Governor Earl Warren was re-elected in 1946 in a victory that indicated the state's return to its traditional

Republican affiliation. At the start of the campaign, both Warren and his Democratic opponent, state Atty. Gen. Robert W. Kenny, declared themselves bipartisan liberals, and each took advantage of the state's law to cross-file in the opposite party. Warren had the support of the American Federation of Labor, while Kenny had the backing of the Congress of Industrial Organizations' Political Action committee. In the June primaries the governor won about 90% of the Republican vote and approximately 55% of the Democratic vote, and thus became the first executive in the history of the state to win both the Republican and Democratic nominations. Will Rogers, Jr., was chosen over Rep. Ellis Patterson to be the Democratic nominee for the U.S. senate. As a result of the governor's victory in the primary, interest in the pre-election race centred on the contest between Will Rogers, Jr., and the incumbent senator, William F. Knowland. The November elections found the Republican candidates victorious, Knowland defeating Rogers by around 900,000 votes.

A number of state propositions came up for consideration at the election. Californians voted to float a bond issue for \$100,000,000 to help veterans get homes and farms but turned down a proposal to make business loans to veterans. A state-wide minimum of \$2,400 per year for teachers' salaries was approved. A law to legalize dog racing and betting thereon was voted down, as was a Fair Employment Practices commission which would have tried employers suspected of discriminating against employees because of race, religion, colour, or ancestry.

Disputes between labour and management and jurisdictional disagreements between various labour factions slowed the return to peacetime activities in 1946. A mass strike of 100,000 A.F. of L. labourers tied up business in Oakland for three days, while a jurisdictional labour dispute at seven of the major Hollywood movie studios led to

violence between pickets and nonstrikers. As part of a nation-wide movement, west coast shipping was tied up twice during the year while operators and union officials sought to break wage-increase stalemates.

Camouflage

Until World War II, camouflage was rather generally planned and executed from the standpoint of ground attack. While the aeroplane was a factor in World War I, it was not as pronounced in importance as in the later conflict. About 500 B.C., Sun-tzu urged recognition of the art of deception as all important in the art of war; the troops of Genghis Khan trimmed their helmets with leaves and twigs; the Thebans, in the time of Xenophon, outnumbered by the Spartans, sent out a cavalry detachment to mill around and stir up a dust cloud under whose protective concealment they advanced, caught the enemy unprepared and routed him; in 1770, Charles XII burned brush to make a smoke screen, crossed a river under its canopy and defeated the Saxons; in colonial United States, General Braddock refused to recognize the need for camouflage with the result that his bright red-coated troops were decimated by troops who were nearly invisible because they blended with the natural background.

World War II camousleurs had very definitely to deal with aerial photography in planning and executing camouslage. The stereoscopic camera took pictures in three dimensions; the infra-red ray photograph immediately spotted faulty coloration in relation to natural vegetation. Both of these agencies were hard to fool. Nevertheless, World War II camousleurs did a good job. Net camouslage transformed trucks, tractors and tanks into prosaic, "harmless" haystacks. With slight variation, netting formed "flat tops" to screen anti-aircraft guns emplaced for firing. Frequently, garnished chicken wire was substituted for netting.

Soldiers were dressed in dapple-painted clothing and trimmed themselves with surrounding foliage. In the tropics, vivid colours predominated in camouflage colouring; in the north, white predominated. Invariably, the effort was to fuse with the landscape so that, except where natural surroundings were particularly vivid, paint tones were mostly neutral. Battleships, trucks, tanks, jeeps or landing barges were usually painted haze-gray because of its great disappearance value.

By using "flat top" camouflage, great industrial factories

were made to disappear. What really were roof tops and smokestacks appeared to the spying aviator as farm landscapes with their familiar barns, silos and rambling country roads. In the south of England this trick was reversed, and a sprawling industrial city was built of flimsy camouflage materials-electrically controlled, it flared into smoking stacks and flaming forge fires of seeming munitions production. Repeatedly, the Germans were taken in by the ruse and wasted thousands of tons of bombs on a cardboard industrial "giant." In the battlefield, many dummy installations were set up so that they might draw bombing and create confusion concerning real strength and intentions. The Japanese employed shadow painting in the Pacific islands to make the Allies waste bombs. Plane silhouettes were painted on the white coral beaches as plainly seen targets. When the British were hammering at Berlin with their night-raiding planes they encountered what registered as anti-aircraft batteries and air fields around the city. Actually, nine such seeming targets were dummy installations.

The Allies, through co-operation of U.S. and British engineers, led in the production of dummy targets. Tanks, trucks and cannon appeared on roads and fields as fast as they could be inflated from compressed air tanks. Germans wasted many shells on these rubber dummies. The

same was true of aeroplanes seemingly parked and awaiting destruction. U.S. engineers built these dummies to allow easy and rapid handling, prefabricated from wire, target cloth and wood. They were so constructed that an entire squadron of 24 dummy fighters could be built by 30 trained men in two weeks, along with the mock air base paraphernalia to make the ruse complete.

The camoufleur of World War II recognized that an object would be revealed by (1) its modelling and shadow, (2) its outline, (3) its tone, (4) its colour. One of the most important things he had to reckon with was the texture of the surface he presented. If glossy, light was reflected as from the facets of a diamond; if mat, light would be dispersed without concentration on any single object. Shadows bulked large in the engineer's problems. This rule applied: "Use the shady side of big things; sunny side of little things." Truck trains parked on an open road took the side of the road away from the sun or moon. Windshield and headlights were covered to eliminate reflecting surfaces. Here again nature taught the lesson. Creatures which must hide to survive have no reflecting surfaces; they are covered with furs or feathers. Those which already live in a mirror, fish, have shiny bodies. The problem of disrupting outline was met as in

White uniforms provided excellent winter camouflage for troops in World War II. This picture shows members of a Scottish regiment on patrol duty at the Zetten front in the Netherlands early in 1945, with rifles in ready position

nature by use of the fringe pattern. A butterfly's wing markings show "eyes" which are far removed from the real eyes in his body—so, in camouflage, outlines were fringed so as to lead bombing away from vital centres.

One basic formula obtained for all camouflage, either fuse the object with its immediate natural surroundings or bury it out of sight.

Canada

A North American dominion of the British commonwealth, Canada is a federal union of nine provinces brought together under the British North America act, 1867. Area: 3,694,863 sq.mi.; pop. (1941 census) 11,506,655. Capital: Ottawa (154,951). Largest cities: Montreal (903,007); Toronto (667,457); Vancouver (275,353); Winnipeg (221,960), Hamilton (166,337); Quebec (150,757).

In the federal election of 1935, the Liberals under Prime Minister W. L. Mackenzie King, who had been in office with a short interregnum from 1921 to 1930, were returned with 174 seats out of 245. The opposition was composed of 38 Conservatives under R. B. Bennett (prime minister, 1930-35), an exceptionally able man who lacked first class lieutenants, and the Canadian Commonwealth Federation (C.C.F.), a party with socialist leanings under J. S. Woodsworth, who was highly respected but somewhat lacking in driving power. Because of Canada's relative helplessness in stemming the world-wide deflation, the division of jurisdiction between dominion and provinces, and its own vacillation, the King government failed to give the nation a strong lead in pulling it out of the depression. To be sure, it made trade agreements with Britain and the United States, planned Trans-Canada Air Lines, studied the St. Lawrence waterway, helped housing, reorganized the reserve army which since 1918 had existed chiefly on paper, increased spending on national defense, and failed to condemn appearement in Europe. Yet on the whole it lacked vigour.

In all the nine provinces the Liberal party was in power except in Alberta (Social Credit) and Quebec (Union Nationale). In the former, attempts at monetary reform were hamstrung by constitutional difficulties. In the latter, the policies of Premier Maurice Duplessis expressed the deep lying strains in the social, political and religious life of a people with a rural background slowly becoming urbanized and industrialized. Duplessis fixed minimum wages, made loans to farmers and increased the representation of the English-speaking minority in the cabinet. He gave the Catholic Church a more prominent position in official ceremonies and curbed itinerant anti-Catholic preachers. Finally, though asserting that he would not permit a totalitarian state in Quebec and that minority rights would not be interfered with so long as they did not weaken the autonomy of French-Catholic Canada, Duplessis seized the literature and forbade meetings of various leftist groups. The enforcement of this "padlock law" put the Ottawa government in a quandary especially after it had disallowed Alberta's Social Credit legislation.

In Ontario Premier M. F. Hepburn began a long feud with the dominion prime minister. Personal relations had been strained for some time, but the unwillingness of Ottawa Liberals to deal with the railway problem to Hepburn's satisfaction and their reluctance in backing him up in his fight against industrial unionism touched off an intermittent quarrel which eventually made impossible a speedy solution to the urgent problem of dominion-provincial relations. Yet even in the face of this internecine wrangling and of the opposition of financial interests to the repudiation of the power contracts, the Liberals under Hepburn were returned to power in 1937.

In 1938 Bennett resigned leadership of the Conservatives to retire to England where, later, he accepted a viscounty and membership in the house of lords. He was replaced by Dr. R. J. Manion, an Irish-Catholic who was expected to capture seats in Quebec, where his party had made a poor showing ever since it had tried to introduce conscription in 1917. Manion was a moderate protectionist in a traditionally high tariff party, and a relatively lukewarm imperialist for a group which included all those Canadians who without questioning accepted British foreign policy.

French-Canada and Solidarity.—The outbreak of World War II at once made Canadians apprehensive about national unity. In World War I, the vast majority of French-Canadians had refused to enlist voluntarily and in some cities rioted against the attempted enforcement of conscription. French-speaking Canadians, though a minority, were neither small in numbers nor isolated in position. They comprised about one-third of Canada's population and, while dominating Quebec, had important blocs in other provinces as well. They were thrifty, industrious and deeply religious. Their educational and philosophical background emphasized love of family, race and church rather than science and the industrial arts. In consequence, they controlled few important Canadian banking, trading and manufacturing establishments even in Quebec. Hence they had developed an economic inferiority complex. Also they feared that urbanization and modern skepticism might weaken their church and accordingly they had become traditionalists in many of their attitudes. Their motto, officially and in many senses practically, was still 1e me souviens. They were the descendants of sturdy souls who came to Canada before 1700. They felt that France abandoned them militarily during the Seven Years War and left them stranded in a cultural sense by the anticlericalism of the early 20th century. They still had a deep feeling of loyalty to the crown, an outgrowth of their own royalist traditions, but relatively little for the British people because of the lack of blood relationship, a potent factor in their own closely-knit family life. French-Canadians could see no sense in spilling their blood in wars which seemed to have but a remote connection with their own ancestral acres. Their primary loyalty was toward Canada and to Canada alone. They called themselves les Canadiens.

It was against this background that the controversy over conscription and the danger to national unity during World War II had to be placed. In the interwar period, French-Canada had been assured again and again by politicians of all parties that conscription for overseas service would never be adopted. At the same time their leaders asserted that they would fight to the last man in defense of Canada, their patrie, in case it were attacked. It was with this tacit understanding that Canada, of its own

volition and with only a few scattered dissenting voices, declared war.

The feeling of national solidarity was deepened in a spectacular manner by the results of an election in Quebec in Oct. 1939. Premier Duplessis had taken issue with the dominion's authority to impose certain war measures on Quebec although, he declared later, he was not opposed to Canadian participation in the war provided the rights of his province were not impaired. In effect, however, here was an open challenge to the dominion government. Ernest Lapointe, the acknowledged leader of the federal Frenchspeaking Liberals and in practice associate prime minister, along with the other cabinet ministers representing Quebec in Ottawa, campaigned against Duplessis, who was decisively defeated by the Liberals. The result gave deep satisfaction to the English-speaking provinces though, as later events proved, it indicated the French-Canadian desire for national unity rather than willingness to serve in the armed forces.

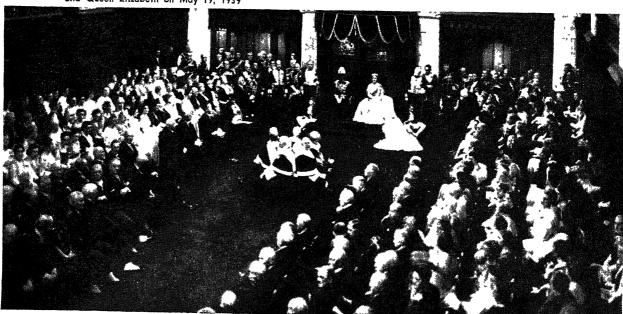

Election of 1940.—In Jan. 1940, Prime Minister King had the house of commons dissolved after a session lasting less than five hours. He argued that a prolonged and unpleasant parliamentary controversy would serve no useful purpose and would lend aid and comfort to the axis. The opposition condemned the action, legal though it undoubtedly was, as pusillanimous and incompatible with the democratic right to criticize government policy. In the ensuing election Dr. Manion was handicapped by his inability to rebuild his party on short notice, his own injudicious statements, his demand made without official party approval for a national government representing all parties, and by the impossibility of reviving the conscription issue in Ontario without losing votes in Quebec. The C.C.F. suffered from the general disillusionment with the then current policy of soviet Russia which many people, rightly or wrongly, associated with left wing groups, and from the party's stand that Canada could contribute more to defeating naziism by sending goods than men, a stand which seemed like trying to escape the legitimate moral obligations of a belligerent. The King government was

Canadian parliament at Ottawa during the visit of King George and Queen Elizabeth on May 19, 1939

returned with 184 seats, 8 more than at dissolution, while the opposition was meagre in ability and divided among Conservatives, C.C.F. and Social Credit.

The fall of France led to a vociferous demand among English-speaking Canadians for a more aggressive war program. Among French-Canadians, if any antiwar sentiment lingered, it now found no overt expression. When disaster struck their mother country, les Canadiens realized that France really meant a good deal to them and that they were now the sole bastion of French culture among the democratic nations. They still displayed little ardent enthusiasm for overseas active service, but they accepted higher taxes and wartime controls with none of the intransigeance of 1917. The government speeded up its munitions production. It accelerated the British Commonwealth Air Training plan. It expanded the Canadian navy many-fold beyond its prewar size. Taxes were stepped up sharply, and the machinery for controlling prices and the supplies of scarce goods was strengthened. The cabinet was reorganized but King, though rejecting the proposal for a government of all parties, was unsuccessful in inducing prominent Conservatives outside parliament to accept office in it. Finally, men were conscripted under the National Resources Mobilization act for home defense. Service outside Canada remained on a voluntary basis. Both the navy and the air force were flooded with recruits, but army enlistments were slower. Calling up men on this plan of limited conscription did not lead to a single disturbance among French-Canadians though a few trouble makers had to be interned. Of course there were wide differences of opinion throughout Canada on specific policies, on the vigour, or scarcity of it, with which King conducted affairs, and also on the apparent lack of a general plan, an overall pattern, to integrate the zealous efforts of individuals and organizations. Nevertheless no one in the interwar period would have thought it possible for the dominion to make such a large and constantly growing contribution to the war effort with so little political acrimony and so few signs of national disunity.

From the 1940 election to early in 1942, Canadian politics were concerned with a variety of topics. The dominion-provincial conference of 1941 came to an almost ignominious conclusion. Prices and wages were frozen; wartime agricultural policy was hammered out over the objections

of some farmers' organizations; the Hyde Park agreement between King and President Roosevelt early in 1942 eased the foreign exchange problem; war plants and shipyards turned out tons of war supplies and ships; enlistments kept up with the demands of the forces. Dr. Manion, who resigned, was followed as Conservative leader by Senator Arthur Meighen, who had been prime minister for short terms in 1919–21 and 1926. An experienced parliamentarian of great intellectual powers and forensic gifts, Meighen represented the more imperialistic and less socially minded group within his party. In particular he took up the demand of conscription for overseas service, a cause which he had championed in 1917 but rejected in the interwar period.

The Conscription Issue.-Meighen and his fellow conscriptionists, chiefly in Toronto and on the Pacific coast, argued that if the case for full compulsory service were clearly and fairly explained to French-Canadians, who had already accepted limited conscription, all but a small minority of extremists would acquiesce in it, if without enthusiasm, then at least with a feeling of resignation to an unfortunate and bitter necessity. He declared too that the danger of national disunity was a bogy manufactured by Liberal politicians for partisan ends and that the dual system of recruiting (voluntary for overseas, compulsory for home defense), besides being wasteful, would leave a calamitous legacy among young men, some of whom would regard the others as shirkers. On the contrary, Liberals contended that overseas' conscription would be the end of confederation, and that the experience with conscription in 1917 had shown conclusively that the numbers obtained were incommensurate with the trouble and expense involved. Nevertheless as a concession to conscriptionist sentiment, the government adopted an unusual course. Perhaps also it hoped that such an overwhelming majority of Canadians would favour conscription that French-Canadians would make no effort to prevent the will of the majority being carried out. In any case, in April 1942, it held a plebiscite asking that it be relieved of the promise which it gave—as did the opposition parties—prior to the general election of 1940 and before the fall of France, that it would never introduce conscription. The government, including ministers from Quebec, the other parties and the English-language press were unanimous in asking release from the promise. This was granted by a vote of 70% for the country as a whole, a majority of four to one in eight provinces but rejected by three to one in Quebec. Clearly French-Canadian opposition to compulsory overseas service had not softened as much as many of the conscriptionists had assumed. On the other hand, the vote indicated that conscription was not the demand of a few imperialist die-hards. For the time being, however, there was no change in the two-army policy. Later King epitomized his policy in the statement "not necessarily conscription but conscription if necessary." The defeat of Meighen when he attempted to get a seat in the house of commons gave the entire issue a temporary quietus.

Period of Quiet.—From mid-1942 to late 1944, dominion politics were relatively tranquil though a new party, Le Bloc Populaire, openly campaigned for a limited war effort. Hepburn, the colourful contradictory premier of Ontario, resigned to be followed by two other Liberals and then (1943) by Col. G. A. Drew, an imperialistic Conservative, whose hold on power was precarious until another election (1945) consolidated his position. A Conservative convention selected as national leader John Bracken, who had been premier of Manitoba since 1922. A sincere man with a firm grasp of agricultural problems, Bracken lacked ex-

perience in many national affairs and was deficient in dynamic qualities. A Liberal at least as late as 1935, he was chosen because he seemed to offer the Conservatives better hope of election than any orthodox party member.

In 1944, the C.C.F. won the provincial election in Saskatchewan, thus for the first time capturing major office. Many C.C.F. votes were cast by those who, for one reason or another, had become disgruntled with the older parties, but the core of the new group was Fabian Socialist. It emphasized social legislation and state ownership of industries that were strongly affected with a public interest or showed monopolistic tendencies. It insisted, however, that most lines of activity, especially those (including agriculture) in which small enterprises flourished would remain indefinitely under private ownership. It emphasized equality of economic and social opportunity without regard to sex, race or religion. It was critical of overseas entanglements because it felt that wars were synonymous with capitalism. Its immediate program in Saskatchewan included better health services, higher pay for teachers, automatic postponement of farm debt if returns per acre were low, collective bargaining with the closed shop, and nationalization of industries beginning with highway transport, cloth and footwear manufacture. Besides victory in Saskatchewan, the C.C.F. during the years 1937-46 became the second largest party in the legislatures of Ontario and Alberta. In British Columbia the Liberals and Conservatives formed a coalition to keep them out of office. Duplessis, still a vigorous provincial autonomist but less critical of the war effort than formerly, was returned in Quebec. The Maritime provinces and Manitoba remained in the Liberal fold throughout the ten-year period.

Again, Conscription.—Late in 1944, dominion politics suddenly became inflamed with passion to a degree rarely equalled. After a visit to the fighting fronts, Col. James L. Ralston, minister of national defense became convinced that Canada could not continue to provide the necessary replacements in its army overseas by voluntary enlistments alone. When he could not persuade Prime Minister King of the alleged necessity for overseas conscription, he resigned and Gen. A. G. L. McNaughton, former commander of the Canadian corps, was appointed in his stead. A month later, King reversed his previous position and ordered overseas 16,000 men from those who had enlisted for service in Canada only, whereupon the popular and able associate minister of national defense who represented a Quebec constituency left the cabinet. All the arguments for and against conscription were gone over again with growing violence of expression on both sides. It appeared that the government had fallen between two stools, losing support among the English-speaking population and failing to retain any in Quebec. Both King and Gen. Mc-Naughton were the recipients of a good deal of personal abuse particularly by the conscriptionists. Some army officers who, contrary to regulations, expressed their political opinions to the press were threatened with court martial. A few home defense troops were insubordinate for a short time, but the conscripts who were actually sent overseas carried out their duties effectively.

It must be emphasized that the navy and air force had always had adequate, and at times a redundancy of volunteers. Only army enlistments lagged, mainly because of the apparently small chance of seeing action and the certainty of long monotonous training. Of the 975,000 men who had entered the services in the first five full years of the war, only 150,000 had been drafted. Of the draftees, 40,000 had

Prime Minister King addressing a political meeting at Montreal prior to his re-election in 1945

been discharged for ill-health or other legitimate causes and 48,000 had later signed up for service wherever they might be sent. The 60,000 draftees who refused willingly

to "go active" were performing important guard duties, working in supply depots and doing other essential tasks in Canada. The 875,000 who had enlisted for active service anywhere in the world were all volunteers, and the number was as large, relative to population, as the United States had raised by its draft. Nevertheless, the Canadian army in Europe, once it went into action on a large scale, was in danger of running short of replacements. Moreover, the number of draftees and volunteers from Quebec, relative to the population in the military age groups, was only about half the similar figures for other provinces. This could have been the result of bona fide rejections for medical reasons, in which case it was an appalling reflection on the living standards of one-third of the Canadian people. It might also have been the result of an attempt by French-Canadians to evade the draft for home defense by various subterfuges even though before the war they had assured the country that they would fight if Canada were attacked as it virtually had been when German submarines operated regularly in the Gulf of St. Lawrence. It might also be attributed to the fact that from the outbreak of war French Canada was suspicious that the English-speaking majority would not adhere to the tacit understanding not to order conscription for overseas—a suspicion which had proved well founded.

Election of 1945.—At any rate, only an election could clear the air of mutual recriminations. By the time this was held, in June 1945, the end of the war in Europe had weakened the main argument of the opposition that the government's manpower policy had been a miserable failure. All but violent partisans admitted that the King government had a good record on war production, price control and finance. Also it had made some plans for reconstruction, and the cabinet contained a small nucleus of more able and experienced men than the opposition parties were likely to have. As a result, the Liberals were returned with a small working majority. In a house of 245, they had 130 including independent (nonconscriptionist) Liberals from Quebec.

Even though Bracken's personality had failed to impress the country, his party was stronger numerically (60 members, chiefly from Ontario) and in debating ability. The C.C.F. under James Coldwell, a former school principal who was competent, aggressive but uninspiring, had 28 members, all but one of them coming from west of the Great Lakes. Social Credit carried most of the seats in Alberta. Only the Liberals could claim to have a reasonable representation from all sections of the dominion. The regional fragmentation of all the opposition parties caused some uneasiness among those concerned with national unity. It was significant, however, that the isolationist Bloc Populaire carried only two seats and that the Liberals, despite the conscription controversy, got 35% of the votes of servicemen outside Canada.

Throughout the entire period 1935-46, King had kept himself in power in Ottawa by an astuteness, born of years of experience, which angered his opponents, confused his own followers at times, but which nevertheless won elections and kept the country less disunited than would have been possible under any other leader. Never a man to arouse fervent enthusiasms, King had an uncanny sense of what Canadians were prepared to accept as the best practicable alternative to their widely divergent interests. In June 1946 he completed 20 years' service as prime minister, and his prestige in international and intra-commonwealth affairs was that of an elder statesman.

In short, the decade 1937-46 was politically important for the rise of the C.C.F., the apparent breakdown of the

old party alignment of Liberals and Conservatives, the persistent problem of dominion-provincial relations, the conscription issue and the long tenure of King. The postwar problems of full employment, social security, national unity, international peace and relative freedom of trade remained to tax the skill of Canadian political leaders.

(A. W. CE.)

External Relations and War Effort

The story of Canada's external relations during the ten eventful years 1937–46 had its beginning in a period of continuous international crises, a period that witnessed nation after nation advocate the progressive weakening of their commitments under the covenant of the League of Nations, a period that saw the failure of the powers, great and small, to permit collective security a fair trial despite the imminent danger of military aggression on a worldwide scale.

Canada's policy toward the League of Nations, largely in accord with that of most other confident "fireproof" powers during the middle 1930s, consistently expressed itself in opposition to the punitive portions of the covenant and thereby undermined the structure of collective security. Prime Minister King had summarized the league policy of the Canadian government when announcing the lifting of sanctions against Italy in 1936. While strictly enforcing such economic and financial sanctions as were invoked against Italy during the Italo-Ethiopian conflict, Canada did not believe in the application of force against an aggressor unless the principle of such application was universally accepted. "There is undoubtedly much that is attractive and persuasive in the conception of a world united to prevent by force a breach of the peace by any aggressor," declared King. "It has been stoutly contended that if all nations would undertake to make war upon an aggressor, and carried out that undertaking, war would never occur. That may well be, but unfortunately it is only a hypothetical argument; it bears no relation to the actualities of today." The required overwhelming preponderance of power, economic and military, as against any possible aggressor was lacking in the league, as was its universality anticipated by its founders who envisaged the league imposing peace throughout the world. While admitting that occasions might arise where military action might become advisable, the Canadian prime minister declared that "so far as Canada is concerned, that would be for parliament of Canada to decide in the light of all the circumstances at the time." If the league was in no position to become the international war office, it could at least perform the less spectacular role of developing and applying the instruments of conciliation and arbitration of specific disputes before they led to open challenges and entrenched positions. If there still remained any doubt of the Canadian government's policy respecting the use of league sanctions this was dispelled once and for all by King's statement in the house of commons on May 24, 1938, that "the sanctions articles have ceased to have effect by general practice and consent, and can not be revived by any state or group of states at will."

Policy of Caution.—The determining principles of Canada's external policy during the troubled years prior to the outbreak of World War II embraced the following: (1) maintenance of the unity of Canada as a nation; (2) priority of Canada's relations to the United Kingdom and the United States over its relations to the league of nations; (3) adoption by Canada of a back seat in all international discussions of European and Asiatic problems; (4) denial of any Canadian obligation to participate in

the military sanctions of the league and in the defense of any other part of the British commonwealth and empire; (5) denial of any obligation to participate in the economic sanctions of the league; (6) necessity of the Canadian government securing parliamentary approval in advance of any Canadian participation in military or economic sanctions or in war, and (7) willingness of Canada to assist in the restoration of international trade and to participate in international enquiries respecting economic grievances.

This inherently negative quality of Canada's external policy arose not only from the government's concern for the preservation of national unity. Its policy of nonintervention and "no-commitments" grew also out of Canada's feeling of detachment from Europe and Asia and a belief in its own "secure" position resulting from membership in the British commonwealth of nations and proximity to the United States. Canada's attitude, for example, in 1937 toward the Sino-Japanese conflict, was one of strict neutrality and of expressed readiness to support the United States and Britain (the obvious leaders of any efforts to restrain Japanese aggression) in movements "designed to restore peace in the Orient through methods of conciliation." This Canadian policy was in accord with that of the United States, which urged Japan and China to search for an amicable settlement. It was also one certain to win favour in Britain, which obviously was more vitally concerned with events in Europe at that time.

Additional examples of Canadian policy in accord with that of the senior member of the British commonwealth, during the last fateful years prior to the outbreak of World War II, occurred in connection with the imposition of a rigid Canadian embargo on aid to Spain in men and war materials during the Spanish Civil War (1937); the recognition of the king of Italy as emperor of Ethiopia (Dec. 22, 1938), in the hope of improving relations with Italy and thereby safeguarding the Mediterranean lifeline to Britain's eastern possessions; and the tacit and sometimes explicit support of the British government's policy of German appeasement during the Czechoslovakian crisis (1938-39). Like Britain and other western democracies, Canada was slow to realize that each surrender to the demands of the aggressive axis powers made a firm stand subsequently more difficult and ultimately ineffective. Even on the occasion of the Munich agreement (Sept. 29, 1938)—the high-water mark in Britain's appearement policy -the Canadián prime minister wired Arthur Neville Chamberlain: "The heart of Canada is rejoicing tonight at the success which has crowned your unremitting efforts for peace."

Canadian enthusiasm and heart-felt relief over the Munich settlement was of short duration once the shabby treatment suffered by Czechoslovakia became known, and when the nazis forcibly occupied Prague, parliamentarians and students of public affairs commenced a stock-taking of Canadian external policy that appeared long overdue. Discussions outside of parliament in 1939 displayed a chastening realism that Canada was still a small power with little or no choice but to follow the foreign policy of the United Kingdom. The "colonial mentality" of the most vocal elements of the English-speaking Canadians remained a dominant factor, although some began to advocate a clarification of Canada's right to neutrality in case the mother country became involved in a European war.

While presenting a carefully phrased exposition of Canadian government policy to the house of commons on March 30, 1939, King expressed himself in a manner that

indicated considerable sympathy with the nonintervention point of view. "The idea that every twenty years this country should automatically . . . take part in a war overseas for democracy or self-determination of other small nations, that a country which has all it can do to run itself should feel called upon to save, periodically, a continent that can not run itself and to these ends risk the lives of its people, risk bankruptcy and political disunion, seems to many a nightmare and sheer madness." Nevertheless, to those who advocated a resolution proclaiming the right of Canada to decide its own neutrality, the Canadian prime minister replied that the same consideration of the overwhelming importance of national unity which prompted his government to decline making premature statements of possible belligerency operated against declaring positive neutrality. Such a declaration might lead to passionate controversy within the country, especially between English-speaking and French-speaking Canadians, and would undoubtedly lend aid and comfort to a potential aggressor.

The Canadian government was determined to steer a middle course between those whose distrust of British policy and fear of imperialistic entanglements prompted them to advocate a declaration of neutrality and those whose traditional patriotic fervour led them to answer "Ready, aye, ready" in support of any action which it might be necessary for the British government to take. This middle course ruled out automatic commitments and conscription for overseas service while giving assurance of co-operation with the other members of the British commonwealth in any war of unprovoked aggression which gravely threatened the United Kingdom. Moreover, it was predicated on the assumption that Canada's major contribution in war would be industrial and that her military contribution would be relatively small and largely for home defense.

Thus it was that three years of debate on the grave issues of peace and war culminated in a heartening unity of spirit, a curious blend of resignation, tolerance, caution and idealism, as the Canadian people realized that all efforts for peace had failed.

Entry into War.—On the day (Sept. 1, 1939) that Germany invaded Poland the Canadian government issued a proclamation in the name of the king declaring that a state of "apprehended war exists and has existed since the twenty-fifth day of August," while the prime minister, in fulfilment of a long-standing promise, summoned parliament to meet on Sept. 7 for the purpose of authorizing "effective co-operation by Canada at the side of Britain" in case the latter became involved in a war with Germany.

When the Canadian parliament assembled and the speech from the throne was read, the intentions of the government regarding the nature of Canada's participation remained concealed, although Britain had formally entered war on Sept. 3. "You have been summoned," ran the speech, "in order that the government may seek authority for the measures necessary for the defense of Canada, and for co-operation in the determined effort which is being made to resist further aggression. . . . " King did not, however commit his government to a declaration of war until Sept. 9, when he announced that if the house approved the speech from the throne the cabinet would immediately take steps for "the issue of a formal proclamation declaring the existence of a state of war between Canada and the German reich." With the approval of the address that evening, a royal proclamation was issued on the morning of Sept. 10, wholly on the advice of the Canadian cabinet. Thus was settled a long-standing controversial question as to the ultimate scope of Canada's sovereign authority in international relations; thus did Canada enter the war at the side of Britain with the conviction that its interests were one not only with those of the mother country but those of world freedom.

At the outbreak of the war in Sept. 1939 Canada's armed forces totalled only 10,355 officers and men-a naval nucleus of 1,774, a permanent army of about 4,500 (exclusive of the nonpermanent active militia of approximately 60,000) and an air force of 4,060. With the progressive deterioration of the international situation, the estimates of the department of national defense rose from about \$23,000,-000 in 1936 to \$36,000,000 in 1937 and approximately the same amount in 1938. Nevertheless, in the summer of 1938, Canada still lacked anti-aircraft guns, tanks, armoured cars, heavy coastal ordnance and many other items of defense equipment. Of the peacetime defense appropriation of \$64,500,000 in the summer of 1939, the air force received nearly half, thereby indicating the service designated as Canada's first line of defense. Hence with a Royal Canadian air force of 11 permanent and 12 nonpermanent squadrons organized or in the process of organization, with additions made in fighters, bombers and advanced twin-engined trainers from England, advanced singleengined trainers from the United States and from Canadian plants, and with a nucleus of experienced fliers, Canada possessed in the summer of 1939 a force capable of patrolling its coasts and of rapid expansion for more distant theatres of war. The Canadian navy, the most neglected of the defense services, consisted at that time of only six modern destroyers, five mine sweepers and three small training vessels.

Despite various measures taken during the preceding three years, Canada was by no means adequately prepared for war. Nevertheless, if this inadequacy was the natural result of the Canadian government's strategy of caution, compromise, no conscription and no commitments pledges, its justification appeared in the calmness and unity of spirit with which the Canadian people freely entered the second World War within a quarter century. Following a series of prewar protective measures which provided for the transfer of air force squadrons to the Atlantic seaboard, the manning of coastal defenses and important installations, the inauguration of military mobilization, the proclamation of the War Measures act, the creation of the Wartime Prices and Trade board and the Foreign Exchange Control board, the September emergency session of the Canadian parliament passed a war appropriation of \$100,000,000, imposed a number of special taxes designed to finance the war on a pay-as-you-go basis, and authorized the creation of the department of munitions and supply (a War Supply board assigned contracts until the department was set up on April 10, 1940), to provide the necessary armaments and war materials and to co-ordinate the entire industrial production of Canada with that of the United Kingdom and ultimately with the whole Allied war effort.

Canada's immediate war program, the outcome of close consultation with the British government, embraced home defense, the protection of Newfoundland, Labrador, the British West Indies, and the French islands of St. Pierre and Miquelon, the rapid expansion of the Canadian navy, the creation of the largest possible air force through the development of a Commonwealth Air Training plan, the authorization of an army of two divisions—one to be recruited at once and made available for overseas service on a voluntary basis, if and when required, and the maximum

utilization of the nation's human and natural resources for the production of munitions of war, raw materials and food stuffs.

During the winter of 1939-40, however, the impact of various forces upon Canada's basic defense program brought about a significant shift in emphasis. The British manufacturers, captivated by the "Maginot line" concept of warfare and opposed to the rise of a competitive Canadian armament industry, postponed as long as possible release of the latest British designs, while the government of the United Kingdom, anxious to conserve Canadian credits for the purchase of food and raw materials, gave little heed at first to the urgent need of Canadian industry for British machine tools and blue prints so indispensable to a maximum Canadian war effort based upon the assumption of overseas service of men and material in conjunction with those of Britain. Moreover, the tendency of the Canadian public-spearheaded by newspapers and citizens of pronounced imperialist sentiment-to visualize the nation's maximum war effort in terms of hundreds of thousands of infantrymen, as was the case in 1914-18, rather than to appreciate the significance of a balanced and effective program and the costly and long drawn out demands of modern mechanized warfare, and finally the failure at this time of the government to instruct the public on the overall picture of the war effort it was contemplating, were other contributing factors in the shift in emphasisfrom a war effort predominantly industrial to one largely military. Only after the collapse of the Low Countries and of France did the tremendous expansion in Canadian manufacture of military equipment and munitions really get under way.

Whole War.—Hence, Canada committed itself to a big army policy early in the war. The crisis of 1940 prompted the Canadian government to announce on May 20 and 27 the addition of a third and a fourth army division, to be followed by notice of a fifth in Feb. 1941 and a sixth in August—thereby constituting an army establishment of five infantry divisions, an armoured division, an infantry tank brigade and headquarters and ancillary troops.

The Canadian army comprised not only general service personnel who enlisted voluntarily for service anywhere, but also men called up for compulsory service in Canada and its territorial waters under the National Resources Mobilization act of June 1940. Of the total male intake of 1,017,962 for the three armed services from Sept. 1, 1939, to Sept. 30, 1945, the army received 766,491, of which 608,435 were enlistments and appointments and 158,056 N.R.M.A. conscripts. About 59,000 of the latter availed themselves of the opportunity of volunteering, during the call-up process and training period, for duty overseas in any theatre of the war. Although thousands of N.R.M.A. men served overseas during the concluding months of the war under an order-in-council provision passed in anticipation of heavy replacement needs, over 86% of the Canadian army were volunteers, exclusive of 25,252 women serving in the nursing service and the Canadian women's army corps.

The Royal Canadian navy likewise underwent a remarkable expansion during the war. Within the six years its personnel grew, by voluntary enlistment alone, from 1,774 to 99,739, exclusive of over 6,600 in the women's Royal Canadian naval service. Of these 107,000 in uniform, 42.5% served at sea in the R.C.N.'s 939 naval vessels of which 378 were combat ships. While Canadian seamen in the early stages of the war received their basic training and special courses in the United Kingdom, subsequently

the greatly enlarged and improved naval bases at Halifax, Nova Scotia and Esquimalt, British Columbia, the R.C.N. college near the latter centre, the signals school at St. Hyacinthe, Quebec, and the 12 new bases developed on the eastern and western Canadian coasts and in Newfoundland and Bermuda provided the necessary training facilities. Aside from its remarkable shipbuilding program, which embraced 3,788,000 tons of cargo vessels, 486 naval escort ships and 3,542 other craft, Canada's five years' performance outlined below was such as to win it third place in naval power among the United Nations.

Overshadowing all other Canadian war activities were those which made Canada, in the words of President Roosevelt, "the aerodrome of democracy." Not only did the Royal Canadian air force recruit wholly by voluntary enlistment a total of 222,550 men and nearly 17,000 women during the war. It applied remarkably ingenuity, persistence and resourcefulness in its development and administration of the British Commonwealth Air Training plan, frequently regarded as Canada's major contribution to the victory of the United Nations.

University of the Air.—The British Commonwealth Air Training plan, based originally on a proposal made by the government of the United Kingdom to the governments of Canada, Australia and New Zealand on Sept. 26, 1939, and set forth in an agreement signed at Ottawa on Dec. 17, 1939, entrusted the Royal Canadian air force with the provision of all equipment (except advanced trainer planes) such as air fields, hangars and other buildings for 74 training schools, practically all the instructional staff, the administration of the scheme, and 80% of the trainees. Under the original agreement, Canada's share of the estimated total cost of \$600,000,000 was \$350,000,000, while the United Kingdom undertook to pay the air crew graduates serving overseas and to make other contributions in the form of aircraft, aircraft engines, and accessoriesa provision which almost wrecked the plan on the occasion of the German break-through to the North Sea in May and June 1940.

Thus the plan was in ruins almost before the project had begun to bear fruit, for the United Kingdom was now incapable of providing the advanced trainers and twinengine craft it had promised. In the midst of grave shortages in equipment, the Canadian government nevertheless decided to accelerate and expand every phase of the project under new schedules which were wholly Canadian. The nation pooled its construction industry to speed completion of the training schools, air fields and hangars and to provide the elementary training planes, while Washington came to the rescue with vitally important engines and advanced trainer planes. Additional assistance came through diverting shipments of planes for France and Sweden.

The measure of the success of this energetic program of establishing and developing a Canadian specialized university of the air was soon apparent. The last of the 74 training schools envisaged in the original plan, came into operation in Dec. 1941, six months ahead of schedule. By Jan. 1944, the time of maximum expansion, 154 air and ground training schools and 206 ancillary units were operating from 231 sites, with a faculty of 104,113 service and civilian personnel exclusive of 15,000 in training for staff positions. Down to March 31, 1945, the date of its termination, the B.C.A.T.P. trained and graduated 113,553 airmen, of whom 38% were pilots, 23% navigators, 12% air bombers, 25.5% wireless operators and air gunners,

and 1% to 5% flight engineers, at a cost to the Canadian government with respect to the training plan in Canada alone of more than \$1,281,000,000. The Royal Canadian air force provided 72,835 or 55% of the graduates under the plan, the R.A.F. 32% and the Royal Australian air force and Royal New Zealand air force the remainder. In addition, Canadians made up 97% of the 106,514 B.C.A.T.P. graduates of ground crew courses, and of these, over 35,000 proceeded overseas. Over 15,000 Canadians also served in the women's division of the R.C.A.F., thereby releasing thousands of men for combat duty.

The outstanding success of Canada's air program, not to mention at this point the mobilization of the nation's economic and industrial resources or the participation of the R.C.A.F. in air operations overseas, gave striking evidence of the fact that from the summer of 1940 Canada fashioned its all-out war effort in the interests not only of the utmost aid to Britain but of the defense of North America and ultimately of non-axis nations everywhere. As Britain's steadfastness continued to prevail against successive nazi onslaughts, the myth of North American isolationism dissolved, the peoples of Canada and the United States came to look upon the English channel as their first line of defense against the dictator states, and the U.S. government began to recognize the need for joint action with both Canada and Britain on behalf of their common security.

Joint Defense.—Canadian-U.S. wartime co-operation, while based upon urgent necessity of the two peoples for concerted plans on behalf of the defense of the northern portion of their hemisphere and for checking axis aggression, had its roots deep in a long history of increasingly friendly relations, based upon a common language, a common way of life, a continuous expansion of economic and cultural relations, and a growing awareness of the mutually advantageous and interdependent geographical positions of their respective countries. In addition, while remaining loyal to the British commonwealth tradition, Canada grew during the prewar years more North American in general outlook and in the orientation of its external policy, thereby constituting itself the major linchpin in Anglo-American relations.

Long-standing cordiality in Canadian-U.S. relations coupled with the realization of interdependent defense interests prompted Prime Minister King and President Roosevelt to discuss matters pertaining to North American defense as early as March and Sept. 1937. Joint staff conversations on Canadian-U.S. defense commenced the following year, and on Aug. 18, 1938, at Kingston, Ontario, President Roosevelt foretold the closer military co-operation of the war years when he gave assurance that "the people of the United States will not stand idly by if domination of Canadian soil is threatened by any other empire." The Canadian prime minister endorsed this significant expression of common defense interests when he replied two days later that: "We, too, have our obligations as a good friendly neighbour, and one of them is to see that, at our own instance, our country is made as immune from attack or possible invasion as we can reasonably be expected to make it, and that, should the occasion ever arise, enemy forces should not be able to pursue their way, either by land, sea or air to the United States across Canadian territory."

These mutual undertakings on behalf of continental defense, strengthened as they were by additional meetings of the heads of the two nations in Washington (Nov.

1938), in Canadian Atlantic waters (summer 1939) and in Warm Springs (April 1940), helped to bridge the gulf which the outbreak of war interposed between neutral and belligerent. The decision of the United States to withhold application of an embargo on the shipment of arms to Canada until the latter's declaration of war on Sept. 10, 1939, and the subsequent amendment of the Neutrality act (Nov. 4) in such manner as to permit Canadian import of U.S. arms and aircraft on a cash-andcarry basis and to exclude Canada and its territorial waters from the restrictive provisions generally applicable to combat and associated areas, gave evidence of official willingness of the United States to co-operate with the lone belligerent among the nations of the western hemisphere. During this period of crisis, when official opinion in the United States was far ahead of public opinion, the personal friendship and mutual confidence of King and Roosevelt, built up over many years, and the good sense of the Canadian people ensured against any belief arising that Canada was attempting to influence the policies or to interfere in the domestic affairs of its good neighbour.

Thus it was that when the prime minister and the president took the first formal step toward joint defensive arrangements between Canada and the United States at Ogdensburg on Aug. 17, 1940, the agreement won the acclaim of government and opposition parties and press alike in both countries. As announced on Aug. 18, the Ogdensburg agreement made provision for the establishment of a Permanent Joint Board on Defense to commence immediate studies relating to sea, land and air problems, including personnel and material, concerned in the broad sense with the defense of the northern half of the western hemisphere. Consequently, the two governments on Aug. 22 each appointed a civilian chairman, a diplomatic official as secretary and high ranking army, navy and air officers to their respective sections of the board.

Although security restrictions prevented publication of the board's recommendations during the war years, the fact that it held meetings in Ottawa, Washington, Boston and Halifax and subsequently in San Francisco, Seattle, Victoria and Vancouver during the autumn and winter of 1940, indicated its concern in an advisory capacity with the overall problems of Atlantic and Pacific coastal desense and the allocation of prime responsibilities to the respective governments. More specifically, the board recommended the reinforcement of naval bases at Halifax and Boston by a heavy concentration of air depots in Massachusetts and air stations in Nova Scotia and Newfoundland. The proximity of Greenland placed it within the initial view of the board which laid plans for its defense and that of the northeastern approaches to the North American continent. Moreover, in the Pacific area, the board recommended the construction of a chain of air bases from Edmonton to Alaska, with branch lines extending into the interior of British Columbia. It early became evident that the board's preliminary discussions and recommendations greatly facilitated the problem of proceeding with additional schemes of joint Canadian-U.S. co-operation after the United States entered the war. In fact the co-chairmen of the board (Mayor F. H. La Guardia and Colonel O. M. Biggar) announced on April 17, 1941, that "strategic plans for the military and naval defense of Canada and the United States have been completed and the board from now on will devote itself to keeping these plans up-to-date to meet changing conditions."

Almost simultaneously with the creation of the Per-

manent Joint Board on Defense, Britain and the United States negotiated a preliminary agreement (formally signed on March 27, 1941) whereby the former leased defense bases in Newfoundland and Bermuda to the latter and exchanged leases on several Caribbean bases for 50 U.S. destroyers. A protocol attached to this agreement safeguarded arrangements respecting the defense of Newfoundland already made by Canada and the United States in pursuance of recommendations of the joint defense board, and recognized that the defense of Newfoundland was an integral feature of the Canadian scheme of Atlantic defenses.

Prominent among other joint Canadian-U.S. defense projects were an agreement signed on March 19, 1941, providing for the development of navigation and power in the Great Lakes-St. Lawrence basin and a new interpretation the preceding November of the Rush-Bagot agreement of 1817 whereby ships of war might be built on the Great Lakes and offensive armaments installed, provided that the latter were not put into serviceable condition until the vessels had reached the sea. This latter symbol of friendly relations extending throughout a period of nearly 130 years received a further interpretation by an exchange of notes between the governments of Canada and the United States on Dec. 13, 1946, permitting the peacetime stationing of naval vessels on the Great Lakes for training purposes by either government subject to the proviso that full information concerning the number, disposition and armaments of the vessels was previously disclosed.

Perhaps the most striking examples of joint Canadian-U.S. responsibility for defense was a series of projects undertaken in northwest Canada and Alaska and carried to completion in record time through urgent military necessity and the prompt marshalling of the pioneering spirit, engineering skill and material and financial resources of the two co-operative peoples. The most significant of the series were the famous Northwest Staging route from Edmonton to Alaska that resulted from the development of the pre-Pearl Harbor Canadian airway facilities through longer landing strips, improved hangars and other aerial installations, the Alaska highway that followed the general route of the afore-mentioned airway, and the Norman Wells-Whitehorse Canol pipe line-all designed for the purposes of Alaskan and northwestern defense, offensive action against Japan and the dispatch of lend-lease aid to soviet Russia.

Under terms of the agreement signed by Canada and the United States on March 17 and 18, 1942, the United States undertook to build the Alaska highway, stretching from Dawson Creek to Fairbanks, and to assume the cost of construction and maintenance until the termination of the war and for six months thereafter unless Canada preferred to assume responsibility at an earlier date, while the Canadian government undertook to provide rights of way, timber and gravel, to waive import duties, sales taxes and licence fees, and to facilitate the free admission of labour and supplies from the United States. At the close of the war, in accordance with the agreements, the 1,250 miles of the road running through Canadian territory reverted to Canadian ownership and became an integral part of the Canadian highway system with safeguards against the composition of any discriminatory conditions respecting the use of the road as between Canadian and United States civilian traffic.

Likewise, the two governments co-operated in the construction during 1942-43 of the Canol project, involving drilling operations in the vicinity of Norman Wells, the building of pipe line from Norman Wells to Whitehorse

and from Skagway to Whitehorse, and the erection of an oil refinery at Whitehorse and storage facilities at Prince Rupert, the whole venture being designed to supplement tank car movements of oil over the Alaska highway and to provide oil for Alaska and the Yukon if axis action should interrupt tanker shipments up the coast.

Other less spectacular but nonetheless vital aspects of northwest defense included a closely integrated network of weather observation posts and forecast stations of special service to aircraft using the Northwest Staging and the Mackenzie river air routes, additional flying facilities in the form of flight strips, and telephone and telegraph lines built by the United States government along the general route of the Alaska highway. The genuine spirit of cooperation which prevailed between the governments, servicemen and citizens of the two countries in the Northwest during the war, remained to guide the postwar disposition of these same defense projects.

Canadian-U.S. wartime co-operation embraced also the productive facilities of the two nations. The chief measures for co-ordinated activity grew out of the Hyde Park declaration of President Roosevelt and Prime Minister King on April 21, 1941. This "economic corollary" of the Ogdensburg agreement had as its main objective the pooling of all available resources of the two countries in the interests of hemisphere defense and the rendering of aid to Britain and the other democracies. To achieve this end, Canada and the United States each agreed to specialize in those aspects of war production in which it excelled and to expedite the transfer of essential materials across the boundary. In addition, the United States undertook to ease Canada's exchange difficulties by increasing U.S. purchases of Canadian defense articles and by transferring to Canada British lend-lease materials for inclusion in Canadian manufactures for the mother country.

The attainment of the above goals was greatly facilitated by a series of joint committees, the first of which was the Materials Co-ordinating committee set up on May 1, 1941. As a further step toward the implementation of the Hyde Park declaration, the two governments in June 1941 appointed Joint Economic committees from among their official experts to effect a more efficient and co-ordinated utilization of the combined resources of Canada and the United States and to recommend ways of alleviating postwar economic dislocation. On the recommendation of the Joint Economic committees the two governments on Nov. 5, 1941, established the Joint War Production committee.

As a result of the substantial degree of integration already existing in war production between Canada and the United Kingdom and between Canada and the United States, Canada became on Nov. 10, 1942, a member of the Combined Production and Resources board formed five months earlier by the senior English-speaking powers. Thereafter, the three countries closely integrated and adjusted their production programs to the strategic requirements of the combined chiefs of staffs. Additional examples of integrated war effort included the work of the Joint Agricultural committee, established in March 1943, to review agricultural and food production in Canada and the United States, the Joint War Aid committee formed during the Quebec conference (Aug. 22, 1943) to study problems arising out of the operation of United States lend-lease and Canadian Mutual Aid programs, and the Combined Food board which admitted Canada to full membership on Oct. 29, 1943, for the purpose of obtaining an expeditious utilization of the food resources of the United

Nations. (See also Canadian-U.S. War Committees.)

Indeed, Canada constituted a vital link between Britain and the United States by virtue of the constant endeavour of the various joint committees, of which it was a member, to adjust at every stage of their defense and production programs the requirements of Canadian and U.S. aid to Britain with the demands of hemisphere defense and ultimately their own individual needs for the marshalling of a maximum national war effort.

The Military Effort.—Canada's contribution through its three combat services was in the long run hardly less significant than its efforts on the industrial front, despite the prewar belief of the government that its primary role would be the provision of munitions and foodstuffs. Before the winter of 1939-40 ended, the 1st Canadian division landed in England under the command of General Mc-Naughton, a former Canadian chief of staff and an artilleryman of high reputation. The 2nd division followed in the summer of 1940, and by 1943 the Canadian army overseas consisted of five divisions and a large variety of corps, army, G.H.Q. and communication troops. Organized into the 1st Canadian army with Gen. McNaughton as G.O.C.-in-C. in April 1942, the original Canadian corps then under Gen. H. D. G. Crerar was supplemented by the formation in Jan. 1943 of the 2nd Canadian corps with Gen. E. W. Sansom in command.

Although continuous Canadian army activity on the continent of Europe began on July 10, 1943, with the Allied invasion of Sicily, Canadian troops had served as garrison forces in the British West Indies, Newfoundland and Iceland, and as a highly mobile, defensive spearhead in the United Kingdom during the dark months of anxiety that followed the collapse of France and the evacuation of Dunkirk in the summer of 1940. In the interval, the Canadian forces surmounted the severe test of inaction with rare discipline and intensive training in assault technique which they applied with high courage in a "reconnaissance in force" against Dieppe on Aug. 19, 1942. When full-scale operations were launched against the Westwall in June 1944, it was apparent that the costly experience gained in the combined raid on Dieppe contributed to the success of General Dwight Eisenhower's momentous undertaking.

The 1st Canadian infantry division and army tank brigade went into action in Sicily in July 1943, as part of Gen. Sir Bernard Montgomery's 8th army. Crossing to the mainland on Sept. 3, it participated in the advance up the east coast of Italy and bore the brunt of heavy fighting around Ortona in December. Meanwhile an additional contingent of Canadians arrived, including the 5th Canadian armoured division and other units of the 1st Canadian corps under the command of Gen. Crerar. During the remainder of their Italian campaign, the Canadians played a major part in the costly penetration of the Gustav and Hitler lines in the Liri valley in May 1944, and the Gothic line in October. The following December found them participating in the drive on Ravenna and the Senio line, which fell in Jan. 1945.

Meanwhile, the approach of Operation "Overlord" (June 6, 1944) against Hitler's Westwall found the Canadian forces in Britain highly trained for their perilous task through many months of participation in combined operational and large-scale assault exercises. When D-day arrived, the 3rd Canadian division was one of the five Allied army divisions landing on the Normandy beaches. Other formations soon followed; by July 31 Gen. Crerar

was in command of the 1st Canadian army, concentrated in the extreme leftward sector of the Allied line around Caen, where its forces distinguished themselves.

Holding the left flank of the 21st army group commanded by Gen. Montgomery, the Canadian army broke out from the Caen bridgehead in August, drove south to capture Falaise and link up with the Americans, and assumed the arduous task of clearing the Channel ports and flying-bomb sites. Then followed the clearance of the Scheldt estuary, the opening of the Port of Antwerp to Allied shipping, the four bitter winter months in the Nijmegen salient in the Netherlands, and the participation in the crossings of the Rhine that commenced on March 23, 1945.

In April the 1st Canadian corps arrived from Italy to rejoin their comrades in the Netherlands as part of the 1st Canadian army. Following the consolidation of the Rhine bridgehead, this army, whose basic strength was five Canadian divisions and two armoured brigades in addition to troops of the British and army, the 1st Polish division and Belgian, Dutch and Czech brigades at various times, undertook the task of clearing the Netherlands. Despite the compliment of the German high command in consistently opposing the Canadian army with some of the best German troops, it shattered these in battle groups and up to May 4-the day prior to the mass surrender in the Netherlands and northwest Germany-took 192,000 prisoners. An additional 180,000 troops, mainly of the German 25th army, subsequently awaited disposal in those surrender areas.

The following weeks saw the Canadian army disarming these large forces, assembling them for removal from the Netherlands, co-ordinating underground forces eager to deal with the vanquished Germans, organizing relief and other essential welfare services of the civilian population, setting up effective military government in that portion of northwestern Germany then under Canadian command, and enabling the Dutch authorities to resume, by June 30, their governmental functions after the long German usurpation.

While the major contribution of the Canadian army took place in the Italian and northwest European campaigns, including that of the 1st Canadian parachute battalion, which dropped with the British 6th airborne division in Normandy early on D-day and again over the Rhine on March 23-24, 1945. Canadian units engaged in desperate fighting at Hong Kong in Dec. 1941, formed part of the United States-Canada special service force which was in action at Kiska, the Anzio beachhead and the drive on Rome, helped the United States forces in the Aleutians to reoccupy Kiska in Aug. 1943, and saw service from time to time in Newfoundland, Labrador, Iceland, Alaska, Gibraltar, Spitzbergen, the British West Indies and islands adjacent to the east coast of America. The total casualties suffered by the Canadian army in all these operations (as reported to Dec. 31, 1945) were 80,640, including 22,790 fatalities, 51,416 wounded, and 6,432 liberated or repatriated prisoners of war-losses much lighter than in the war of 1914–18, when nearly 60,000 of the 200,000 casualties were fatalities.

The Navy.—The service rendered by the Royal Canadian navy, which expanded more than 52-fold during the five and a half years of war, proved vital to the victory of the United Nations. Its main function prior to D-day was that of convoy protection and submarine hunting along the North Atlantic route, the lifeline of Europe. From the first weeks of Sept. 1939, to the victorious months of 1945 when the R.C.N. took over the entire close escort of

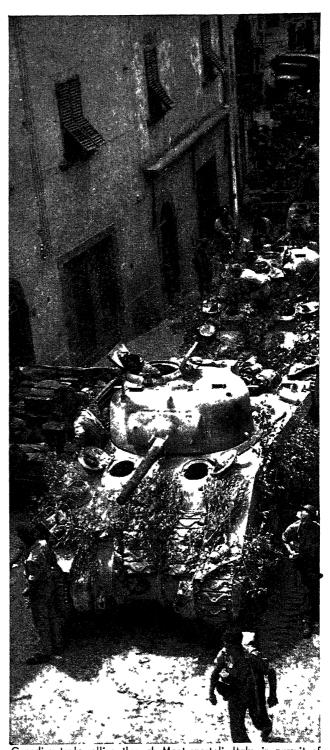

merchant convoys, its 378 combat ships convoyed 25,859 merchant vessels eastward from North American ports and 16,823 westward. They convoyed to the United Kingdom alone a deadweight tonnage of 235,104,856, the largest single merchant armada being one of 167 ships in Aug. 1944, bearing a cargo of more than 1,000,000 tons. As befitting this primary function, the R.C.N.'s numerical strength was in small vessels such as corvettes, frigates, mine sweepers, patrol vessels and auxiliary craft, constructed in Canadian shipyards.

Nevertheless, during the progress of the war, the R.C.N. greatly increased its offensive strength through the addition of 2 cruisers, 2 aircraft carriers, and a few dozen destroyers, including the Tribal, Fleet and escort classes built in British and Canadian shipyards, and 7 of the 50 U.S. overage destroyers delivered to Britain during 1940 in exchange for strategic land bases. Drawing upon its offensive power, the R.C.N. assisted in convoying the United Nations armada to axis-held bases in North Africa, provided four landing craft flotillas to help land the British 8th army (including the 1st Canadian division) in Sicily and Italy, aided the United States navy in its expedition to occupy Kiska in Aug. 1943, and provided Canadian sailors to man motor gunboat flotillas in the English channel. Moreover, there were at one time 2,000 Canadian seamen on loan to the royal navy, as well as a considerable number manning some of the heavier guns on merchant ships.

More than 100 R.C.N. ships and almost 10,000 seamen participated in the invasion of France on June 6, 1944. While 4 of Canada's Tribal class destroyers and a similar number of the royal navy engaged in assault work against German ships in the English channel and Bay of Biscay, and 2 new Fleet class destroyers bombarded coastal fortifications prior to the landings, other R.C.N. vessels, including 9 escort destroyers, 2 supporting groups of frigates, 19 corvettes, 2 flotillas of mine sweepers, 2 flotillas of motor torpedo boats, 14 assault craft, 2 huge infantry landing ships and 30 other landing craft, aided extensively in mine-sweeping the narrow channel, protecting the seaward flanks of the convoy routes, making the channel safe for reinforcements and supplies, and putting safely ashore many thousands of Allied troops. R.C.N. warships also took part in the invasion along the southern coast of France, and in the landing of British troops in Greece and the Aegean Islands during Oct. 1944. While Vice-Admiral Percy Nelles, chief of the naval staff of the R.C.N., acted as senior Canadian flag officer with general oversight of all Canadian naval forces overseas during the invasion of the continent, he did not have a definite command as Canadian ships participating in the invasion force operated in conjunction with other Allied forces, not as separate Canadian units.

As the final curtain fell on the Pacific war, Canada's plans called for participation in offensive action against Japan through the employment of approximately 13,500 men afloat and 60 ships, including 2 cruisers, an antiaircraft vessel, 2 new aircraft carriers, and a considerable force of destroyers and frigates.

Thus Canada's naval effort during the war was a not unimpressive achievement for a nonmaritime-thinking people who had placed complete reliance upon the British and United States navies for defense. To the winning of World War II—for the Allies, a war of supply by sea—Canada contributed not only 5,000,000 tons of shipping but also a moving steel wall of steadily increasing naval strength around the preciously ladened convoys, and considerable offensive power. The R.C.N. sank 17 U-boats,

Canadian tanks rolling through Montespertoli, Italy, in pursuit of retreating Germans. Montespertoli fell to Canadian armoured forces and British infantry in the Allied drive toward the German Gothic line in 1944

assisted in the sinking of another 10, and received credit for probably sinking or damaging several more. In addition, it sank, destroyed, captured or damaged at least 31 enemy surface craft and assisted other Allied forces in accounting likewise for another 80. Its losses, on the other hand, totalled 31 warships and 2,957 casualties including 1,985 fatalities, 264 missing, 87 prisoners of war and 621 wounded or injured.

R.C.A.F.-Finally, Canada made a tremendous contri-

bution to Allied air supremacy-in the opinion of Field Marshals Albert Kesselring, Karl Von Runstedt and Hermann Goering "the greatest single reason for the German defeat." To the attainment of that "unheard of superiority," the Royal Canadian air force made such heavy commitments in the development and administration of the British Commonwealth Air Training plan (described above) that its participation in air operations overseas was at first necessarily limited. Nevertheless, in Feb. 1940, an army co-operation squadron arrived in Britain to work with the 1st Canadian division, and in June another such squadron as well as a fighter squadron proceeded overseas. Gradually, new R.C.A.F. squadrons were formed in Britain from personnel trained under the B.C.A.T.P. until eventually 47 squadrons were operating with R.A.F. units in the four-commands-bomber, fighter, coastal and transport.

A separate Canadian bomber group, which commenced operations in Jan. 1, 1943, made as many as 25,353 sorties during 1944 and dropped over 86,000 tons of bombs in that year alone. In addition, there was a Canadian squadron in the Pathfinder Force of the bomber command which played a brilliant role in marking targets for successive waves of bombers.

In 1941 six additional units joined the original R.C.A.F. Fighter squadrons, and in 1944 the number was increased by six more. In 1942 an all-Canadian fighter wing was formed in Britain from three Spitfire squadrons, and later three more R.C.A.F. wings were set up. Down to the spring of 1944, the fighter squadrons were chiefly engaged in escorting day bombers of the R.A.F. and U.S.A.A.F. over airfields, rail centres and factories in axis-occupied territory. The fighters also engaged in low-level ground strafing against axis defenses, airfields, factories, power lines, locomotives and other vehicles. In addition, they did convoy patrol in British coastal waters and occasionally attacked axis ships attempting to slip from harbour to harbour.

In the spring of 1944, the R.C.A.F. fighter wings added a new role to their varied activities and became fighter-bombers. They played a significant part in dive-bombing rocket sites, bridges, freight yards and radar posts during the weeks preceding D-day, and from then onward were the spearhead of attack, covering the invasion beaches, dive-bombing German strongpoints, and taking a heavy toll of German transport and fighting vehicles.

A fighter-reconnaissance wing of the R.C.A.F. gathered tactical information in preparation for the opening of the second front, and continued this work deep into German-occupied territory during the invasion of western Europe. In addition, the R.C.A.F. contributed three night-fighter squadrons for the defense of Britain during the years 1941–44, and toward this end destroyed large numbers of flying bombs before they could reach their targets.

R.C.A.F. units operating from Britain, Canada and Newfoundland under the coastal command performed the vital but arduous duty of guarding shipping, sweeping over the seas in search of U-boats, shepherding convoys to port, or bombing axis merchant and naval vessels. Other R.C.A.F. units accompanied the 8th army in its triumphant advance from El Alamein to Cape Bon, across to Sicily and up the Italian peninsula, escorted convoys, carried freight and hunted submarines in the wide expanses of the Indian ocean, and finally provided several transport squadrons for the conveyance of troops and supplies to the Allied forces in the Netherlands and Germany.

While the strength of the R.C.A.F. increased during the

war from about 4,000 to over 206,000, with 47 squadrons serving overseas, approximately 20% of the air crew in the R.A.F. operational squadrons were also Canadian. Canadian pilots, navigators, wireless operators and air gunners served with the R.A.F. in every theatre of the war, including the skies over Malta, North Africa, Italy, Europe and Burma. Also, approximately 5,000 Canadian radar specialists were attached to the R.A.F. overseas.

Such was the record of the R.C.A.F. But the price Canada paid was heavy; over 16,800 R.C.A.F. airmen out of a total casualty list of nearly 22,000 gave their lives for their country and freedom's cause.

The contribution of Canada's land, sea and air services, which embodied more than 1,000,000 men, was such as to make Canadians intensely proud of their fighting men and of their country, despite the fact that the organization and direction of the three services overseas made them little more than subordinate branches of the British. Yet Canada's economic contribution to the Allied war effort was likewise magnificent: Its war production for 1939-45 totalled \$11,501,000,000 exclusive of \$972,000,000 for delivery of orders placed abroad. Its domestic exports jumped from \$924,900,000 in 1939 to \$3,218,300,000 in 1945. It provided mutual aid expenditures to the United Kingdom, Australia, China, France, India, New Zealand, the U.S.S.R. and the West Indies totalling over \$2,575,000,000 for war equipment, war materials and food. Its citizens and corporations purchased from Jan. 1940 to Oct. 1945, a total of \$12,673,400,000 in war and victory bonds, war saving certificates and war saving stamps. Its engineering achievements at Shipshaw, Steep Rock and Polymer-to mention only a few examples-resulted in the production of vast quantities of aluminum, high grade iron and steel and abundant synthetic rubber to meet the urgent demands of war. Clearly, the Canada of 1939 was, no more; in the course of the war years it emerged, in the words of its prime minister, "from nationhood into a position generally recognized as that of a world power," nearer in status to the great powers than to that of the small.

Canada as a "Middle Power."—In symbolic and practical recognition of Canada's new and peculiar status, its government adopted a policy in 1942 of reorganizing and enlarging Canadian diplomatic representation abroad. For example, Canada for the first time exchanged ministers with Brazil, Argentina, soviet Russia, Belgium and in Nov. 1943, raised its plenipotentiaries to the status of ambassador in the United States, soviet Russia, China, Brazil, Mexico, Chile, Argentina and Peru; at the close of the war, its ministers to France and Greece were made ambassadors. Moreover, the Canadian parliament during 1946 passed a bill providing for a distinctly Canadian citizenship and began debating the question of a distinctively Canadian flag.

Indeed, this achievement by Canada of national maturity and new "middle" power status became evident as early as 1944 in the debates of the house of commons concerning Canada's future role with respect to postwar collective security. Situated as Canada was in close proximity with the two greatest world powers, the United States and the U.S.S.R., and associated by tradition and sentiment with the third, the Canadian prime minister rejected a British proposal (as expressed by Lord Edward Halifax in Toronto on Jan. 24, 1944) for a unified and unanimous foreign policy "framed and executed by all the governments of the commonwealth," as a conception running counter not only to the future establishment of an effective system of world security but to the true interests of the commonwealth itself. In meeting world issues of

Principals of the second Quebec conference, Sept. 11–16, 1944. Front row, left to right: General George C. Marshall, Admiral William D. Lechy, President F. D. Roosevelt, Winston Churchill, Field Marshal Sir Alan Brooke, Field Marshal Sir John Dill. Back row: Major General Leslie C. Hollis, General Sir Hastings Ismay, Admiral Ernest J. King, Sir Charles Portal, General Henry H. Arnold and Admiral Sir Andrew B. Cunningham

security, Canada was opposed to the idea of power-blocs and the resultant inevitable rivalry between great powers. While its desire was to go forward in closest consultation with the other independent members of this unique community of British nations in the spirit of an "entente cordiale," relying on the common pool of ideals, traditions and usage in their attempt to reach joint agreement whenever desirable, the Canadian government took the view that its future commitments respecting the great issues of security should be part of a general scheme of international organization embracing not only commonwealth countries but all like-minded countries.

Thus the lessons of war, the fateful experiences of Britain at Dunkirk and after, the fundamental shift in power wrought by the presence of the United States and the soviet union in the inner councils of the United Nations during the Moscow-Teheran-Yalta-Potsdam sequence of conferences, the new "middle" status of Canada among the nations and its "central position in the power zone of the air age," not to mention the dependence of its highly precarious economy upon the establishment of world peace, "one and indivisible," and upon the free flow of international trade, all combined to swing the Canadian government and people around to a complete reversal of their pre-1939 League of Nations position. Indeed, the Canadian prime minister underlined in the house of commons on Aug. 11, 1944, this reversal of policy when he declared concerning the question of organizing world security: "We have made it clear that Canada will do its full part in carrying out agreed security schemes, whether they involve the creation of an international police force, or alternatively, the measures for seeing that there will always be a preponderance of power available to protect the peace."

It was a foregone conclusion, therefore, that the Canadian government and people would welcome the Dumbarton Oaks proposals as the bases for discussion in the fashioning of a strong postwar international organization. Yet this did not preclude criticism of the draft charter in parliament and subsequently at the San Francisco conference (April 25-June 26, 1945). From the outset Canada was conscious of the need of finding a compromise between the theoretical equality of the then 30-odd United Nations and the practical necessity of limiting national representation on international bodies in a practical manner. At San Francisco the Canadian delegation, representative of the three major political parties, pressed for such amendments as would give Canada as a "middle" power the influence in the organization that its contribution to the war effort entitled it. While recognizing the principle that power and responsibility should go hand in hand, they urged the conference not to act on the false assumption that power was exclusively concentrated in the hand of any four or five states.

In keeping with this attitude, the Canadian delegation achieved a considerable measure of success in its efforts to secure enhancement of the powers of the General assembly and Social and Economic council, the exemption of procedural matters from the veto of the permanent members in the Security council, and the recognition of the claims of middle powers that in the election of the six nonpermanent members of the Security council, due regard should be paid, "in the first instance, to the contribution of members of the United Nations to the maintenance of international peace and security and to the purposes of the Organization, and also to equitable geographical distribution." Backed by the Netherlands, Canada also secured an amendment, whereby an unrepresented member should be invited "to participate in the decisions of the Security Council concerning the employment of contingents of that member's armed forces." The validity of Canada's middle power concept of functionalism—the synthesis of power and responsibility at an intermediate level of international activity—was thus recognized without disturbing the effective operation of the Security council under great power control.

While Canada did not become one of the six nonpermanent members of the Security council, the General assembly of the United Nations, meeting in London from Jan. 10 to Feb. 14, 1946, recognized its growing influence in international affairs by electing the nation to two other highly important bodies-the 18-member Social and Economic council and the special Atomic Energy commission. It was the hope of the Canadian delegation that the Social and Economic council might foster those forces of economic, social and cultural co-operation so essential to the elimination of some of the most dangerous causes of war and thereby bring men and nations into new paths of constructive activity. Canada's membership on the Atomic Energy commission, resulting from its provision of the pitchblende deposits for the production of uranium and its share of much of the fateful secret with the United States and Britain, permitted it the opportunity to urge safeguards to ensure the use of atomic energy for peaceful purposes only and to protect mankind against the hazards of violation and evasion.

In many other respects Canada helped to point the way to the fundamental concept of the world as a single community. Especially did it apply its "functional" approach to the vital economic and social problems confronting the war-shattered world by giving unstintingly to the support of U.N.R.R.A., playing a prominent part in the establishment of the Food and Agricultural organization, the Permanent International Civil Aviation organization, the International Bank and Stabilization fund, and by working toward the elimination of all forms of prewar discriminatory treatment in international trade.

Thus did Canada, during the ten eventful years, cast aside its "no-commitments" policy of the interwar period, gird itself powerfully during five and a half years as a champion in its own right of the liberties of mankind, attain in the doing a new status as the principal "Middle Power" among the nations, and play no small part in the fashioning of international institutions in the interests of the security, liberty and welfare of all peoples.

The Canadian Economy

To the economist, the ten years 1937–46 represented, for Canada, as for other countries, the slow development of long run forces with the more spectacular changes wrought by World War II superimposed upon them. A federation of 9 provinces with 12,000,000 people linguistically and cul-

turally divided between French and English, with strong political ties with Great Britain and equally strong economic links with the United States, with physical resources great in certain directions and cruelly limited in others, with a heavy stake in world trade, with a high standard of living which its citizens were jealous to protect—such a country had some basic problems peculiar to itself and other fundamental ones shared with other countries. Among these basic questions were full employment, social security, dominion-provincial relations, external trade and transportation. During the war some of these issues were allowed to solve themselves, and the economic aspects of the conflict—allocation of manpower, wage and price control, munitions production and so forth—occupied the centre of the stage.

The depression of the 1930s had hit Canada with exceptional severity. The deflation of prices was disastrous for a country whose economy was geared to the production and sale of such staples as wheat, lumber, newsprint, fish and base metals. As a debtor nation Canada was obliged to sell goods in competitive markets at depressed prices in order to meet heavy fixed payments for interest on money borrowed abroad. Moreover, the physical volume of external trade was cut by tariffs, quotas and barter arrangements as well as by the general decline in prosperity throughout the world. At home, a drought of unprecedented proportions hit the Canadian west. The production of wheat in Saskatchewan, which had averaged 265,-000,000 bu. annually for the years 1926-28, fell to an annual average of about 96,000,000 bu. for 1934-36. Total national income, which was \$5,272,000,000 in 1929, was reduced to \$2,812,000,000 in 1932 and on a per capita basis from \$526 to \$268. Though the general average was down about 47%, the decline in the two drought-stricken provinces of Saskatchewan and Alberta was 72% and 61% respectively. Of course reduced prices of goods and services enabled a dollar to "go farther" than four years earlier, but even so the shrinkage of real income after 1929 was serious, especially in areas exposed to decreases in the value and volume of exports.

Intractable Depression.—In dealing with the depression, Canada had been handicapped by a number of factors. It could do little to stem the world-wide trend toward nationalism in trade. Indeed, Canada raised its own tariff to the highest level in its history. Moreover, because the dominion had to import many essential goods such as cotton, citrus fruits, certain minerals and manufactures from abroad, the effect of any purely domestic policy, for example, a large scale attempt to "prime the pump" by government expenditures, would be soon drained off to other countries through larger purchases from abroad. The policy of easy money, adopted in Canada as elsewhere, had little buoyant influence because of the prevailing pessimism in business. Also, there was confusion within Canada regarding the proper course of action to take. The program of expediency which was often followed, inevitably resulted in working at cross purposes. Even if a consistent program had been devised, it would have been difficult to carry it into effect under the Canadian constitution and in the face of political ill-feeling between the dominion and some of the provinces. In short, the depression was extraordinarily severe in Canada and peculiarly intractable.

On account of the obvious importance of external trade to the economy, the government turned its attention to this problem early in the depression. In 1930 the tariff was increased considerably with the intent of preserving jobs for Canadians and insulating the country from deflation abroad. In 1932 under the Ottawa agreements, the various members of the commonwealth slightly reduced their customs duties *inter se* while retaining them against the rest of the world. Canada's external trade had improved slowly after 1933 until, in 1937, it approached a level which ordinarily would have provided full employment within the dominion. However, this increase was attributable chiefly to exports of gold stimulated by President Roosevelt's monetary revaluation and of base metals in response to the demands of war. Agriculture, fishing and lumbering were still plagued by poor markets abroad, and the large regions in Canada dependent on these industries were badly depressed.

The trade agreement originally made in 1935 with the United States was renewed with some modifications three years later. Though it was far from the full reciprocity for which successive Canadian governments had struggled for decades and then finally rejected in 1911, it did permit more favourable access, especially for lumber and dairy products, into the most convenient and prosperous market for Canada. In 1938, also, Canada and Britain arrived at an agreement reducing or giving guarantees against increases on a wide range of commodities. The Canadian concessions to Britain were greater than those received from Britain, presumably because since 1932 British exports to Canada had increased less rapidly than those in the reverse direction. A party nominally favouring low tariffs was in power in Ottawa, but there were no serious breaches in Canada's protective system. Tariff-making had become a highly technical task because of the need for balancing the conflicting claims of various interested parties and for preventing the extension, by means of the most favoured nation clause, of benefits to countries which had not given an adequate quid pro quo.

Besides tariff policy, the governments of Canada and the United States renewed discussion of the proposal for building the St. Lawrence waterway so that vessels with draughts up to 27 ft. could travel between tide water and the head of the lakes, and for developing the hydroelectric power along the route. The Canadian parliament passed the necessary legislation, but the U.S. senate rejected the treaty notwithstanding the enthusiastic support of President Roosevelt. The province of Ontario objected to the scheme because it would add to the public debt, injure the railways and generate power for which no market could be foreseen.

In 1935 a Liberal government in Ontario had repudiated contracts made by the previous Conservative administration for the purchase of power in wholesale quantities for the publicly owned system in Ontario from privately owned companies in Quebec. Various legal technicalities and the argument that the contracts put the public system of Ontario in bondage to the power barons of another province were used as excuses to get rid of obligations to buy, or at least to pay for, power for which there was no market during the depression. Later, after some political manoeuvring, these contracts were renewed on terms more favourable to Ontario. The dominion refused to permit the export to the United States of the surplus power still existing.

Throughout the depression the problem of deficits on the publicly owned Canadian National railways occupied a large measure of government attention. The railway, formed in 1923, comprised various companies which had failed to pay their way financially and which would have gone into bankruptcy during World War I if it had not been for government assistance. It included also other lines which had been constructed originally by the public.

Some of the railroads were poorly built and had high operating expenses. Because many of them were designed to compete with each other, proper co-ordination was lacking. All of the constituent companies were overcapitalized so that, when depression and drought hit the country, the system could not pay its bond interest and the government had to meet the huge deficits. In 1932 alone, the dominion contributed for this purpose virtually all the receipts from the income tax.

A royal commission, appointed in 1932 to investigate the problem, castigated the Canadian National railways for extravagance in building hotels, constructing unnecessary branch lines, introducing luxurious passenger services by rail and coastal steamers, and generally competing in a wasteful manner with the Canadian Pacific, the large and world-famous privately owned system. At the same time it did not relieve the latter from its share in the general competitive folly. The commission recommended an aggressive attempt to cut expenses by eliminating duplicating services and unprofitable branches. In carrying out this plan, the managements of the railways tried to balance gains by one road against gains by the other. Neither system was prepared to give up any competitive advantage, and thus the savings were negligible in relation to the continuing inability of the Canadian National to earn its bond interest and of the Canadian Pacific to pay dividends on common and preferred stock.

In 1937 Sir Edward Beatty, president of the Canadian Pacific, began a campaign for unification. The physical properties of each line were to be owned by their existing proprietors but they were to be operated as a single unit by a board of directors nominated jointly by the two roads. The savings which, Beatty claimed, would amount to \$75,000,000 a year with the traffic volume of 1930, would be divided in an agreed ratio. Canadian National officials believed that the savings were greatly overestimated even if one imagined that the public and organized labour would be so docile as to allow a railway management ruthlessly to apply drastic measures. Some shippers questioned whether a single road would give the same quality of service as the two competing ones, though Beatty insisted that these fears were groundless because of the competition with carriers by water and highway and the spirit of service pervading railway management. Financial interests in Montreal and Toronto favoured unification. After some jockeying for position, all political parties officially opposed the scheme. The tremendous increase in the volume of railway traffic during World War II permitted both systems to make large profits, and the "railway problem" temporarily solved itself.

Meanwhile, the government through the Canadian National railways had set up Trans-Canada Air Lines which, by 1946, was providing high quality service from Victoria, B.C. to St. John's, Newfoundland. It was also operating on the transatlantic route and planned still other extensions. The so-called bush operators flying the short north-south routes from railhead to isolated mining camps had been consolidated into one system by a subsidiary of the Canadian Pacific which was not, however, allowed to operate transcontinental or transoceanic services. An Air Transport board was set up in 1944 to plan a postwar pattern for civil aviation in Canada. Air transportation had become of vital importance to Canada because of its value in carrying passengers and freight to isolated districts and because of the dominion's strategic position along the Great Circle route between the large

cities of the United States and of Europe and Asia.

Province-Dominion Dilemma.—Dominion-provincial relations were a thorny topic in the pre-World War II period. The framers of the British North America act, 1867, Canada's constitution, clearly intended that the federal government should have the preponderance of taxing and legislative power. They gave it jurisdiction over national defense, money and banking, the post office, most railways, navigation, criminal law and so on, and the right to raise money by any method of taxation. The provinces received control of such matters as education, municipal institutions, local public works, property and civil rights within the province and the levying of direct taxes. Because the dominion had the bulk of the taxing authority it was to pay annual subsidies to the provinces on the basis of population.

The precise meaning of the terms of the B.N.A. act was determined by the Judicial committee of the privy council, the highest court of appeal for Canadians, sitting in England. Over the course of the years this committee strengthened the powers of the provinces as opposed to those of the dominion. Furthermore the natural course of events tended in the same direction. Minimum wages, factory laws, social security measures, education and the like came under provincial jurisdiction. With the steadily growing industrialization of Canada, the practical field of provincial law-making power expanded, altogether apart from the legal decisions. This growth of authority was not accompanied by any change in the legal right to tax 'nor by any proportionate augmentation of resources subject to provincial taxation. Provincial debts and financial needs were growing much faster than tax revenue, particularly in those provinces which suffered severely in the depression. The situation was not so acute in Ontario and Quebec, where it was possible to tax the concentration of corporate and individual income and property in Toronto and Montreal even though part of this wealth had been derived from business profits originating in other provinces.

The discrepancy between jurisdiction and revenue had grown wider through the years, but the problem had been deferred by extra subsidies which under various subterfuges had been paid to the outlying provinces, and by conditional grants, i.e., direct payments by the dominion to the provinces provided the latter would administer and make small contributions to such matters as old age pensions. By the 1930s, the arrangements for the payment of subsidies had become wholly illogical. Conditional grants were objectionable because they forced a province to come into some scheme when it might otherwise have preferred to stay out. If it refused to enter, its citizens would, through the taxes they paid to the federal treasury, be paying for benefits received by other provinces while they obtained none themselves. A final difficulty was that in the depression the revenues of some provinces had declined so greatly that they were unable to meet their expenses for interest, education, relief and so on. Accordingly the dominion had loaned large sums to certain provinces with little hope of repayment.

Matters were brought to a head by the decision of the Judicial committee on the "New Deal" legislation of Prime Minister Richard Bennett. The federal government had hoped that the committee would follow its opinions in the Radio and Aeronautics cases (1932) which, by placing these subjects exclusively under the dominion, seemed to reverse the previous trend toward upholding provincial

rights. Instead, the committee, sustaining the supreme court of Canada, denied the dominion control over unemployment insurance, the marketing of primary products, minimum wages and limitation of hours of work. All these items were considered to deal in pith and substance with property and civil rights; therefore the dominion could not interefere with them under the guise of its authority to carry out certain treaties or conventions with other nations. For all practical purposes the decision made it impossible for Canada to have a nation-wide system of social legislation or to deal as it wished with the problems of the depression unless, of course, it had the B.N.A. act amended, a difficult task in view of provincial jealousies.

In order to re-examine the economic and financial basis of confederation and the distribution of legislative power in the light of the economic and social developments since 1867, the federal government in 1937 appointed a five-man royal commission under the chairmanship of Chief Justice N. W. Rowell of Ontario and, after his illness, of Professor Joseph Sirois of Quebec. Most of the provincial governments and many organizations submitted their views, and finally the commission made recommendations with respect to responsibility for the unemployed, provincial debts, the levying of income taxes and the anomalous subsidy arrangements. Early in 1941, a conference of federal and provincial cabinet ministers called to deal with the proposals came to an abrupt and unedifying close. Ontario and British Columbia objected to the recommendations in their entirety because, they claimed, they were being asked to give up much more than they received. The Ontario government also took umbrage at the fact that after the resignation of Rowell it had no member on the commission. Alberta refused to consider the plans further because of ill-feeling with the dominion over the legality of Social Credit legislation. New Brunswick and Quebec, though not approving the entire scheme, were prepared to use it as a basis for discussion while the other four provinces would accept it with minor modifications.

Social Credit.-Meantime, the government of Alberta under Premier William Aberhart had been trying since its election in 1935 to introduce social credit. The theory of this particular brand of monetary reform was confused by logical inconsistencies, mystical language and, in Alberta, by the religious fundamentalism of Aberhart's Prophetic Bible institute. At all events social credit considered that the cause of business depressions is a deficiency of purchasing power. To provide the money necessary to take off the market all the goods produced, the assets of the province were to be appraised and used as security for "scrip" which would bear a tax of two per cent a week to keep it circulating rapidly in the purchase of goods. In its cruder form a social credit dividend of \$25 a month was promised. Thus, "fountain pen money" would prevent business slumps while preserving individual enterprise and private property. Neither the public debt nor prices were to be allowed to rise. Basically, Aberhartism was a product of the depression in a drought-stricken area where interest charges were maintained and farm prices had collapsed.

Whatever may have been the merits of social credit, its introduction into a single province of Canada ran counter to federal government's exclusive jurisdiction over currency, banking and interest under the B.N.A. act. The courts quickly held Aberhart's initial legislation invalid. In 1937 Alberta passed legislation nullifying the adverse ruling, but the federal government set this aside by using its rusty but legal privilege of disallowing provincial laws. Subsequent Alberta legislation limiting the rights of the press failed to become law because the lieutenant governor,

acting under almost obsolete authority, reserved royal assent. The controversy over jurisdiction resulted in lengthy, heated arguments between the Alberta and federal governments and between the so-called monetary heretics of the west and the conservative bankers of the east. As a concession to monetary reformers the dominion government nationalized the central bank; the Bank of Canada, by buying out that half of its share capital which was privately owned. In practice this did not involve any radical change in banking policy. In the meantime the Social Credit party was torn between the radicals who would tolerate no delay in the introduction of their favourite panacea, and the conservative wing led by Aberhart, who was prepared to give business-like administration in most directions while pressing for social credit as an ultimate objective.

Despite the quarrelling over monetary and constitutional reform, Canadian business was improving. In 1937 national income reached a total figure of \$4,368,000,000 and a per capita of \$395. Unfortunately this improvement was short lived, a decline of roughly 5% occurring in the following year. This was due to the recession in the United States, another poor grain crop in the west, and the steadily deteriorating international situation. More Canadians were employed in 1938 than in the previous year but population had grown, and so the numbers on relief kept fairly constant. The construction trades lagged, though a government scheme for giving financial aid to home builders among the middle income groups had some success. A concurrent plan for helping low cost housing broke down because the municipalities, hard pressed by heavy expenses and loss of tax revenue during the depression, refused to grant the necessary tax exemptions. Wholesale prices improved, and visible stocks of grain were down to normal levels for the first time in ten years. Business confidence was shaken by labour unrest. Strikes which occurred in automobile and electrical plants in Ontario were over wages and union recognition. Basically they were offshoots of the U.S. labour movement revitalized by the Congress of Industrial Organizations. The textile strike in Quebec was conducted by the indigenous Catholic unions and was primarily a protest against low wages and the allegedly arbitrary actions of the management of an industry favoured by a high protective tariff.

Varied Effects of War.-From the declaration of war to the fall of France and the Low Countries there was no substantial change in economic conditions in the dominion. Taxes on luxuries and on incomes were increased and an excess profits tax to prevent profiteering was instituted. A Wartime Prices and Trade board was created to prevent undue enhancement of prices. The Canadian dollar, in sympathy with the pound sterling, depreciated about 9% in terms of the U.S. dollar, thus increasing the difficulty of meeting interest payments on debts owed in the United States by Canadian governments, corporations and individuals. A Foreign Exchange Control board was established to prevent the flight from Canada of capital needed in the anticipated wartime expansion. A few large armament orders were received from Britain, but manufacturers there were reluctant to share their plans and production techniques with potential competitors. Canadian business men who expected that the war would lead to an immediate boom complained. The 1939 wheat crop was the largest in history and the price was improved. Nevertheless, business as a whole was sluggish. Canada's role in the war was expected to be fundamentally that of a producer of munitions, the defender of its own territory, of Newfoundland and the British West Indies, and the supplier of limited numbers of men. In the first eight months of the war Canada, no less than its allies, was deluded by the Maginot line psychology.

The unexpected victory of German aggression on the continent of Europe left Britain and the commonwealth for over a year, as the sole belligerents defending the democratic way of life. Canada became one of the arsenals of democracy and at once placed itself on an all-out war footing. Economically speaking, the basic problem in wartime is simple—how can the productive resources of 'a country be enlarged and redirected toward the all-important objective of winning the war? This fundamental problem can be broken down into questions of manpower, wages, price control, agriculture, munitions output, foreign exchange and finance.

Manpower.—At the outbreak of hostilities there were on relief approximately 400,000 wage earners or about 11% of the then working force. This reservoir of idle labour constituted the first and obvious source of manpower to meet the needs of the armed forces and the munitions industries. As a matter of fact, the figures for idle workers were grossly understated. During the depression many persons did not trouble to record themselves with official agencies as seeking work because they knew no jobs would be available for them. Still others had part-time employment on farms or in lumber woods or in odd jobs, worked full-time on their own account or for others at substandard wages, or were supported by relatives. These statistically hidden unemployed were drawn on as the war progressed. In addition, young persons were induced by high wages or patriotism to leave school at earlier ages than would otherwise have been the case and older men who would normally have retired remained on the job longer. Married women secured work in war plants. Altogether the numbers of gainfully occupied, including the armed services, grew from an estimated 3,863,000 in Oct. 1939, to 4,578,000 in Oct. 1941, and then to a peak of about 5,100,000 from the spring of 1943 to the end of the war in Europe. Expressed in different terms and allowing for natural increase, in Oct. 1939, 46% of the total population 14 years and over were in the armed forces or gainfully occupied compared with 56.5% in April 1945.

The shifts in employment regionally and industrially were important also. Saskatchewan actually lost people and the other prairie provinces failed to hold their natural increase. Quebec, Ontario and to a less extent British Columbia gained, while the maritime provinces had full employment for the first time since 1919. New communities sprang up around military camps and explosives plants. Rapid expansion occurred in large cities like Montreal and Toronto and in many smaller centres such as Kingston and Chicoutimi. Between 1939 and 1945 the number of gainfully occupied increased nearly three times in fishing and forestry, nearly doubled in manufacturing, and showed some increase in transportation, communication, trade, finance and consumer services. Declines were experienced in agriculture and also in mining, where restrictions on gold production were not offset by increases in the extraction of base metals used for war purposes. Employment in construction, after increasing during the building of military establishments, emergency housing and munitions plants, was cut to half the 1939 figure by the end of the war. In order to obtain workers with the necessary skills, vocational training was energetically promoted both in civilian industry and in the mechanized fighting forces.

By and large, the regional and occupational shifts were made voluntarily in response to higher wages, steadier work or patriotism rather than under official compulsion. To be sure, in mid-1940 a registration of all persons over 16 had provided the government with a detailed knowledge of the skills of the people and the National Resources Mobilization act had given it almost complete authority over the allocation of manpower. This extraordinary power was used sparingly and then mainly to call up men for military service within Canada and to freeze to their jobs essential but relatively poorly paid workers like school teachers and farm help. This reluctance to use compulsion was primarily because of the opposition of French-Canadians, as explained above.

By July 1942 the shortage of manpower was beginning to make itself felt. The director of selective service who was responsible for administering the manpower regulations became impatient with the tardiness of the government in dealing with this problem. He advocated a more complete system of compulsory assignment of workers to essential war jobs than the vague one then in force, the closing down of certain industries and drastic action to reduce absenteeism. The government refused to accept the principle of a labour "czar," certainly not one outside the cabinet. For a time the controversy died down, but by late 1944 the acute shortage of men in the Canadian army overseas raised the manpower problem again in what was for Canada a political atomic bomb, the conscription issue.

Wartime Wages.—As labour became scarce, wages tended to rise. Unchecked, spirally increasing wages would have greatly raised the monetary cost of the war and enormously complicated the problem of manpower allocation. Moreover, in plants working on government contracts, the employer was often inclined to side with the men in their demands for higher wages because higher costs could be easily passed on to the public. To forestall these developments, the government put the details of wage determination in war plants and shipyards, later extended to all industry and trade, under a National War Labour board and forbade strikes until after a conciliation board had investigated and made a report. Finally, in Oct. 1941, it tied wages in all lines of employment to the cost of living. As the index of the cost of living rose above the 1939 level, workers would be automatically entitled to higher wages in accordance with a sliding scale which slightly favoured the low income groups. Firms which had not, during the war, increased their wages beyond the 1939 level were authorized to do so, but any further increases could be made only as the cost of living index rose or with the permission of the War Labour board, which was to iron out regional and occupational discrepancies. Because the government did all in its power, including the payment of subsidies on commodities, to hold down the index, wages rose only modestly after 1941. The board found it increasingly difficult to carry out its functions in the face of pressure by labour unions for upward adjustments, each minor individually, but serious cumulatively.

During the war, organized labour strengthened its position. Membership grew from about 360,000 in 1939 to 700,000 in 1945 and spread out from the prewar fields of transportation, coal mining and clothing manufacture to the automotive, aircraft and general industrial fields. Running parallel with U.S. developments, the industrial as distinct from the craft unions made the greatest relative gain while the Catholic unions remained stationary in numbers.

In 1940 the government granted labour in war plants the full right to organize and bargain collectively with employers. Though apparently receiving privileges identical with those under the Wagner act, organized labour protested that company unions were flourishing, that the government was consistently refusing to make labour a full partner in the war effort, and that labour's rights were being whittled away without consulting it by such ordinances as those freezing workers to their jobs and tying wages to the cost of living index thus keeping substandard wages depressed. Meanwhile all the provinces except Quebec and Prince Edward Island had enacted laws patterned after the Wagner act, but temporarily this legislation operated subject to the federal wartime regulations.

For the duration of the war, unions pledged themselves to avoid strikes and to increase production. Nevertheless, strikes with which the official conciliation machinery seemed, for a time, helpless to deal, occurred in steel, aluminum and coal. Even so, the number of days lost by strikes was smaller, relative to the total number of mandays per annum, than in the United States. In order to increase output unions worked successfully with management on joint committees to improve efficiency and reduce accidents. Suggestions from employees were also valuable in helping the war effort on the munitions front.

Finally, during the war, organized labour departed from its policy, traditional in the United States and Canada but not in Britain or Australia, of eschewing ordinary party politics. Some unions officially endorsed the Co-operative Commonwealth Federation, the Canadian Socialist group. On the other hand, many unions and individual members were reluctant to go far along the road toward supporting an independent labour or farmer-labour party. In sum, notwithstanding the fact that during the war the normal functions of unions in determining wages and working conditions were abrogated, the unions were much stronger at the end than at the beginning of hostilities. Yet even in 1945, union membership was only about 20% of the total wage-earning group.

Battle Against Price Rises .- Wartime control of the prices of commodities and services was necessary to keep down the financial cost of the war and prevent the injustice and social unrest which would arise if goods were available to the wealthy and not to others. For the first two years after its establishment in 1939, the Wartime Prices and Trade board, the price control agency, was concerned chiefly with the allocation of scarce, commodities like wool, sugar, fats and leather which were of direct importance for the war. Canadian industry, producing far below capacity in the prewar period, was able to fulfil the needs of the civilian population as well as the requirements of the war itself. It was not until early in 1941 that buying power (boosted by 1,000,000 new jobs) overbalanced supplies (depleted by war needs), and higher prices began to appear to any serious extent. The cost of living rose in the seven months after April 1941, as much as it had risen in the preceding 20 months. To prevent still further sky-rocketing, the government ordered that after Nov. 2, goods and services, with a few exceptions, might not be sold at prices higher than those in effect in the base period of Sept. 15 to Oct. 11, 1941. To reduce pressure on the ceilings, the Prices board kept costs down by means of orders simplifying packages, restricting the number of styles available, tightening up on the extension of credit to consumers, and eliminating nonessential deliveries. Wages, of course, were also government controlled.

Many farm products such as fruits and vegetables were at first exempt from the ceiling, and in the case of meat several increases were granted before, finally, almost all agricultural goods were brought under strict price control. Many farmers, remembering the burden of debt they had to carry during the depression and fearing a repetition of the collapse of prices after World War I, agitated for increases in the goods they sold. Most of the rural population, however, accepted the scheme because they realized the absolute necessity of it in the overall war effort, because they gained when they bought goods for their own use, and because they received direct cash subsidies on milk, cheese, butter and feed.

The prices of goods imported from countries where the price level had risen after the Canadian ceiling was applied had also to be subsidized. Further, to reduce the pressure on prices caused by available spending power from wages and other sources being far in excess of the volume of consumers' goods on the market, purchasing power was siphoned off through higher taxes and war loans. The net result of all these efforts was that the cost of living index (1935–39=100) which stood at 115.8 when prices were frozen, had risen to only 119.0 in May, 1945.

Accompanying price control proper there had to be an equitable distribution of scarce goods among various regions, retailers and ultimate consumers. The board worked out and applied a quota system based on what different districts and distributors obtained in 1941 with allowances for population shifts occurring after that year. For consumers tea, coffee, sugar, preserves, butter, meat and gasoline were rationed on the basis of specific quantities available weekly or monthly for each person or automobile. The sale of household electrical appliances and some other goods was prohibited. For producers, an elaborate system of priorities for scarce goods, notably steel, copper, timber and machine tools was developed by the War Industries Control board and tied into a corresponding U.S. plan. None of these control measures worked without friction, and at times the whole structure seemed to be endangered by pressure from farmers or labour unions as well as tardiness with which price control was instigated and, later, by the speed with which it was withdrawn, in the United States, with whose economy Canadian prices were closely knit. Nevertheless, because of the willingness of the public as a whole to co-operate, the determination of the government, and the skill of the administrators, price control was a conspicuous success in Canada's war effort.

Agricultural Shifts.—On agriculture the war had far reaching effects. Some prewar markets were lost-Germany, Belgium, France and the British outlet for fresh beef, dressed poultry and apples. On the other hand, the British demand for bacon, eggs, honey, condensed milk, cheese and other articles of high food value per unit of volume expanded greatly. Domestic consumption, particularly of milk, eggs and meat, grew rapidly with higher family incomes. Thus there were shifts in the location and the character of the markets. Moreover, ceiling prices were set. Committees of the federal and provincial departments of agriculture planned production in advance in accordance with the dominion's own needs and its commitments to Britain. Special boards were created to manage carefully the movement of bacon, wheat, dairy products and so forth to overseas markets in accordance with shipping and storage space. New techniques were devised for curing bacon while on its way to market, for installing refrigerating equipment in ships and for dehydrating fruits and vegetables.

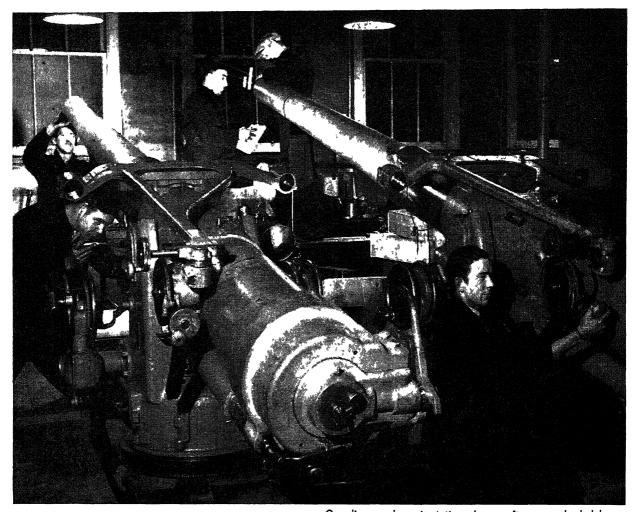

In order to satisfy the enlarged market, eastern Canada intensified its prewar attention to dairy products and live-stock, and the prairies shifted away from wheat, the shaky

reed on which it had leaned so heavily before 1940. The bumper grain crops of 1939 and 1940 overtaxed existing storage capacity, especially in view of the frequent shortage of shipping space across the Atlantic. Farmers were paid for storing grain on their farms, elevators were allowed to accept grain from farmers only in accordance with quotas laid down by Ottawa, and the government paid part of the cost of transporting grain to eastern Canada for feeding livestock. Finally, prairie farmers were subsidized to take land out of wheat and devote it to pasture, coarse grains or summer fallow.

In terms of physical goods production more than doubled. This was attained without any appreciable increase in acreage or in the amount of machinery used. In fact, the number of men engaged in agriculture was decreased by heavy enlistments from rural areas in the first years of the war, by a continuance of the normal trend toward cities, and by the existence of good-paying, steady jobs in munitions plants, where the demand for labour had risen earlier than in agriculture. By 1942 farming had begun to feel the pinch of a labour shortage which continued into the postwar period. To increase production, those remaining on farms had to work harder and longer; the enlistment of bona fide farmers was discouraged; farm machinery was used more intensively or shared among neighbours; farmers' wives, students, urban residents, prisoners of war, and Japanese removed from Pacific coast areas for strategic reasons, helped out in the emergency. The amazing growth in farm output was no less important in the war effort than the production of direct weapons of war.

Munitions.—Canada's munitions program was slow in getting under way mainly because of the general psychological background of the "phony" war period. In mid-1940 the shooting war and the fall of France tremendously speeded up plans. A department of munitions and supply was set up under C. D. Howe, an engineer of great acumen. Gathering about him men of proved ability, Howe placed huge orders with existing industries and shipyards, erected new plants, and conquered one bottle-neck after another. Aircraft, ships, guns of all types, armoured fighting vehicles, trucks, chemicals, explosives and machine tools poured out in a steady stream. A synthetic rubber plant was established in record time to supply most of Canada's wartime and peacetime needs. With almost no previous experience, optical glass and instruments, radar and machine tools were produced in large quantities. A hydroelectric plant as large as Boulder dam was completed in half the time. Month after month railways exceeded their previous records for hauling passengers and freight. By March 1943 Canada's output of war supplies was about 15% that of the United States though its population was less than 12% as large and its prewar state of industrialization very much less. During 1944 Canadian output tapered off a little because the anticipated requirements of the United Nations in some lines had already been reached and because the United States, which after Pearl Harbor had used Canada's already accelerated capacity as a source for certain goods in which its own program was not so far advanced, was now placing these orders at home. By the end of the war, Canada's own forces were using only 30% of the Canadian output of war supplies, the remaining 70% being sent to Britain, China, the U.S.S.R. and other countries.

This huge program was carried through by means of contracts placed with private industrialists. To get production under way, the original contract named a target price, normally the British price plus a small profit, and

Canadian naval repair station where craftsmen overhauled heavy naval guns during World War II

then as productive methods became more efficient, the manufacturer was allowed his costs plus 5% on his investment plus (as an incentive to keep costs down), a further percentage based on the spread between the target and actual costs. In cases where the government supplied the machinery, a management fee was paid the industrialist. Where a company used its own equipment which would have little or no postwar value, high annual depreciation charges could be included in the cost until the total capital was ultimately written off. To check on these contracts, several hundred government audits were continually carried on. Efforts were made to pool the best methods of all plants. Between 1940 and 1942, unit costs were reduced by from 30% to 50%. For example, Bren guns cost \$450 prewar, \$390 in early 1941 and \$192 in 1942. Though businesses made good financial returns during the war, there were no serious charges of profiteering.

Another technique used to handle the munitions program was the incorporation of Crown companies to operate publicly owned steamships, erect houses for war workers and produce or distribute artificial rubber, wool, scientific instruments, machine tools, uranium and so on. Capital was provided by the government, which also audited the books. For the most part, however, these companies were managed without detailed government interference, by business men who were familiar with this type of business organization and who could, in this way, escape government red tape and use their own initiative and accumulated skill.

The munitions program had to be tied in with price

control, the manpower situation, and the supply of scarce commodities. Also in order to prevent unwholesome competition for goods in tight supply, it had to be integrated with the constantly expanding war plans of the United States. In the early stages of the war, when U.S. industry was operating far below capacity, Canada could draw on the apparently limitless resources of that country for the goods which it could not provide. As physical and human resources came to be used more fully, the economies of the two nations, closely linked before 1939, had to be meshed so that the productive resources of both countries would be used to the maximum advantage in the common effort toward victory. This co-ordination was the task of a number of joint Canadian-U.S. boards, and daily, indeed hourly, consultation between "opposite numbers" in Ottawa and Washington.

Wartime Foreign Trade.—The control of foreign trade and exchange quickly intruded itself into the Canadian war effort. The flight of capital from a country which suddenly found itself at war; the conduct of trade with the axis, with axis-occupied territories and with enemy aliens in neutral countries; the export of commodities which were essential to the war effort of Canada and other United Nations; the need for retaining legitimate markets for Canadian goods abroad without discriminating unfairly against consumers at home—these and similar matters were handled by appropriate prohibitions or licensing arrangements.

The shortage of U.S. dollars was a more serious difficulty. Prior to the war, Canada had a very favourable balance of trade (values of exports of physical goods exceeded physical imports by value) with Great Britain and an unfavourable one with the United States. Through the mechanism of international trade, Canada was able without serious difficulty to use its surplus of pounds sterling to meet its deficit of U.S. dollars. After the start of hostilities Britain needed all the U.S. dollars it could possibly secure to pay for its purchases of military supplies and raw materials from the United States. The pounds Canada was acquiring in ever growing amounts because of increased exports to Britain could no longer be converted readily into dollars. At the same time, Canada's need for dollars in New York was mounting because of its expanding purchases in the United States of essential war supplies and of consumers' goods not produced at home. Though Canada sent a large part of its gold reserve to New York, the time fast approached when it might have to curtail its war effort because of the bottleneck of U.S. dollars.

To prevent this, a special excise tax was levied on imports from nonempire countries, importation of certain goods like washing machines was prohibited, travel by Canadians in the United States was drastically curtailed, the production and export of gold and newsprint to the states was encouraged since they supplied U.S. dollars in large amounts, and U.S. tourists were urged to come to Canada. Thus by increasing the flow of U.S. dollars into ·Canada and simultaneously cutting down on the demand for exchange for nonessential purposes, the situation was temporarily eased. When, early in 1942, the exchange problem again became acute, President Roosevelt and Prime Minister King agreed at Hyde Park that the United States should buy from Canada aluminum, ships and certain types of shells in which Canadian output was in advance of its immediate requirements and U.S. production was below its current need. These and other sales supplied Canada with the U.S. dollars needed to support its purchases of war goods in the United States. Even so, there could be no relaxation of the controls already established over foreign exchange, particularly after U.S. tourist spending in Canada disappeared.

The critical situation faced by Britain in the United States was dealt with by lend-lease. Materials were sent to Canada under lend-lease for incorporation within the dominion into aircraft and other goods which were sent on to other United Nations, but Canada itself never took advantage of lend-lease. The fiscal arrangements between the dominion and the United States remained throughout the war entirely on a cash basis.

Canada's prewar favourable balance with Britain mushroomed as exports of war materials and foodstuffs grew. Soon Britain faced a deficit of dollars in Montreal as well as in New York. In the first months of the war, Britain could send gold and securities to Canada to meet its purchases here. Later the dominion either made outright gifts to Britain to offset the deficit or paid for the goods with the understanding that the debt would be repaid by arrangements to be worked out after the cessation of hostilities. This aid-to-Britain was the Canadian counterpart of lend-lease and was supplemented, after May 1943, by mutual aid to soviet Russia, China and other countries. The monetary value of these Canadian arrangements exceeded the amount of lend-lease by the United States if differences in population and in the values of the respective dollars were taken into account.

War Finance.—Canada's finance during World War II

was a story of steeply rising taxes, huge victory loans, expanding national income, the drawing off of purchasing power in order to combat the threat of inflation and mounting public debt. By 1943 taxes had so increased that, to take one example, on a gross income of \$3,000 a single person paid \$824 in tax (prewar \$104), and on \$10,000, \$4,312 (prewar \$946). Victory loans, held twice annually, were oversubscribed, sometimes very heavily. National income rose from \$5,500,000,000 in 1939 to \$11,400,-000,000 in 1945. These data, being at current prices, were subject to some adjustment, 20% to 30%, for price increases. Nevertheless, the growth permitted the government to spend about 50% of the national income for war purposes and still leave the people with sufficient money, on the average, to raise their standard of living above pre-1940 levels. Early in the conflict, the government announced a pay-as-you-go policy of financing the war, but mechanized warfare was so expensive that in the later years only about two-thirds of the cost was financed by current taxes. The remainder was raised by borrowing and so, by March 1946, the dominion debt, direct and guaranteed, had risen from less than \$5,000,000,000 at the outbreak to \$17,300,000,000.

The financial and jurisdictional interrelationships of the dominion and the provinces were simplified during the war. In periods of real or apprehended emergency, the federal government had virtually unlimited powers of control and hence could legally regulate wages, hours, prices and other matters which under normal conditions clearly came under the provinces. In prewar days the provinces had been receiving an increasing proportion of their revenues from gasoline taxes and profits from the government monopoly of the sale of intoxicants. As a result of dominion wartime restrictions on these commodities, provincial revenues were endangered. Hence the federal government made special arrangements to pay the provinces additional subsidies in lieu of these temporary losses of revenue and the waiving, by the provinces, of their right to levy income taxes.

In order to build up a reserve against the unemployment which might be anticipated after the war boom collapsed, the dominion got authority to inaugurate unemployment insurance by going through the formality of asking the British-parliament to amend the B.N.A. act. The governments of Quebec, Alberta and New Brunswick protested that such an amendment required the unanimous consent of the provinces. Nevertheless a scheme of unemployment insurance went into effect in 1942. Three years later Canada began to pay family allowances, popularly called baby bonuses, on a scale graduated by age and the number of children in a family up to \$8 a month for each child under 16.

Economic Legacies of the War.—The conduct of World War II on the economic front required the effective working of a number of compatible policies all directed toward the same end and each contributing to the success of the others. The ultimate results were impressive. Canada's population remained less than that of New York state. Yet among the United Nations, Canada had the third largest navy and was fourth in air power. When war was declared, it had virtually no armament works, no production of large ships or large planes, no guns, no tanks. Thereafter its industrial capacity almost trebled to produce naval and merchant ships, warplanes ranging up to the 15-ton Lancaster bomber, military vehicles, and hundreds of other war items. In addition, food for civilians in Britain

Viscount Alexander listening to a welcoming address by Prime Minister King in the senate chambers at Ottawa after replacing the Earl of Athlone as governor general of Canada on April 12, 1946. The Earl of Athlone had succeeded Lord Tweedsmuir (John Buchan) upon the latter's death in 1940

and in Allied zones of occupation and essential raw materials like metals and lumber for use abroad in making munitions and erecting defense works were produced in huge quantities. Canada became the world's second largest exporter. The country actively participated in the development of the atomic bomb; it gave financial assistance corresponding to lend-lease to Britain and other United Nations totalling about \$4,700,000,000 and its expenditures for war on its own account involved more than \$15,000,000,000. An overall price ceiling, together with rationing, government subsidization of certain goods, controls of manpower, wages and war-vital materials, held down inflation and ensured equitable distribution. Finally, though Canada experienced strains on its national unity during the

war, it emerged from it with its national fabric relatively unimpaired—clearly an accomplishment for a country whose two predominant races differed so radically in their fundamental philosophy of life.

The war left Canada with an apparently distorted economic structure. Its productive capacity in steel had increased about 50% above 1939, in aluminum 5 times, in hydroelectricity 20%, not to mention magnesium, mercury, chromium, iron ore, shipyards, planes, chemicals, synthetic rubber, machine tools and instruments. In four years, 1941–45, about \$1,000,000,000 had been added to plant and equipment. A new industrial army had been recruited and valuable experience had been gained in methods of manufacturing. In aviation, the developments of many decades had been telescoped into a few years, and a merchant marine far beyond probable future needs had been constructed. Social services, including the new family allowances and unemployment insurance, had not been neglected.

The overbuilt industrial capacity of the country made foreign markets as important for manufacturing as for Canadian agriculture, lumbering, fishing and mining. Unfortunately, competition in the world market for manufactured goods remained extraordinarily keen, and Canada's training in selling abroad did not, during hostilities, kept pace with production techniques. In addition there was the acute danger of more or less persistent nationalism and the impoverishment of potential customers. In order to sustain Canadian exports temporarily, a British debt of \$425,000,000 was cancelled in 1946, an interest free loan of \$700,000,000 made in 1942 was extended to 1951, and a new loan of \$1,250,000,000 was made to Britain on terms similar to the contemporaneous assistance by the United States. Added to this were loans totalling \$750,000,000 to France, Belgium and the Netherlands as well as \$76,000,000 to U.N.R.R.A.

Sooner or later these makeshifts would have to be replaced by international trading on a normal basis or else the disastrous mistakes of the beggar-my-neighbour policy of the 1930s would be repeated. Foreseeing this, Canada co-operated fully in supplying money and technical experts in the various attempts—Bretton Woods, the International Monetary fund, the Food and Agricultural organization—to stabilize foreign exchange rates, provide purchasing power, raise nutritional standards and break the fetters of international trade generally. It enlarged its official agencies for making trade contacts abroad, set up an import branch within the government to help others sell in Canada, and made at least a start on tariff reduction by allowing free importation of agricultural implements.

Canada, moreover, was anxious to assist Britain solve its exchange problem. This was not merely an act of patriotism. Unless Britain, Canada's most important customer, could find a way to liquidate its obligations to India and Egypt and export goods and services in order to provide itself with dollars to make normally essential purchases in the United States, it would be forced to retreat within a sterling bloc. Should this occur, Canada would be faced with an exceedingly difficult question. Canada might tie its currency to the dollar of the United States but that country had not always given Canadian trading interests the consideration Canadians felt they deserved. On the other hand, Canada could make its dollar readily convertible only into the pound sterling, retain its chief export outlet but give up hope of meeting its obligations in New York on account of debt, and buy goods ordinarily imported from the United States from other, less satisfactory, sources. Foreign trade had a high priority.

Internally, certain direct legacies of the war had to be handled without delay. The extent of Canada's participation in the Pacific war had not been fully determined by V-I day, but the forces were being slowly reduced in size until September and then demobilized so rapidly that by June 1946 they were down to peacetime strength, about nine times the prewar number of 10,000. Former service personnel were treated generously in regard to postdischarge medical attention, clothing allowances, cash gratuities, rehabilitation grants to be used for buying a home or farm or individual business or for technical or university education, reinstatement by law in pre-enlistment civilian jobs without loss of seniority and hospitalization for the permanently disabled. Surplus war supplies of every conceivable type had to be sold for civilian use or scrap. The factories and machinery acquired, chiefly by the government, for munitions production were sold to private industrialists who, it was claimed, could readily convert at least two-thirds of them to producing civilian goods.

Commodity controls were quickly abolished except on timber and steel, in which acute shortages persisted. Consumer rationing of butter, sugar and meat was continued. Regulations regarding wages were kept in effect but they were steadily becoming more untenable because of strikes in steel, lumbering, inland water transport and other activities basic to speedy reconstruction in Canada or the relief of suffering abroad. The government was finding it almost impossible to hold a balance between preventing a dangerous inflation with an ultimate collapse, and precipitating an immediate contraction through the shortage of goods. Price ceilings were removed on a multitude of relatively unimportant articles, but the broad scheme was retained though obviously it could not be held indefinitely if wage control crumbled or strikes at home and abroad perpetuated wartime shortages of supplies. Some farmers refused to deliver goods for market until agricultural prices were permitted to rise with higher costs of living and of production. Big business was critical of alleged bureaucracy and the high cost of subsidizing some prices to keep them down. It wanted freedom to produce goods at a larger profit and thus, it claimed, maintain employment. Because of the shortage of houses, the control of rents and prohibitions against eviction of tenants were continued despite the inequities which they prolonged or created. The repeated attacks made on the government in 1946 during the passage of an act extending its emergency powers for one year emphasized the strong undercurrent of feeling against wartime restrictions. Late in 1946 the government began a further retreat from wage and price control.

Unemployment was not a serious matter in the 16 months after V-J day. Cutbacks caused by cancellations of orders by Britain and the United States had occurred as early as 1944, and on V-E day only about two-thirds as many were engaged in war production as at the peak in 1943. Civilian output to catch up with deferred demand by consumers or build up depleted inventories easily took up the slack in munitions plants, shipyards and the like. In addition, perhaps 400,000 married women, elderly persons or students quietly disappeared from the labour market. Agriculture and forestry continued to experience shortages of labour because of the greater isolation and poorer pay in these industries.

The government had attempted to anticipate postwar problems by setting up committees of the cabinet, of parliament and of citizens to study and propose definite lines of policy. In 1943 it created a separate department of reconstruction under Howe, who had handled the munitions program with such success. The government adopted the

maintenance of a high and stable level of employment and income as a primary object of policy. It proposed to attain this end by increasing domestic consumption, enlarging export markets, carrying out a broad program of social welfare, stimulating and encouraging private investment and creating a "shelf" of public works from which projects could be drawn for immediate construction should need arise. Many plans were based on the assumption of a relatively long period between the end of the war in Europe and in Asia. During this period substantially all the controls would still be in effect and it would thus be possible under government control of most of the economy to carry through a relatively smooth transition from war to peace. The sudden surrender of Japan catapulted the nation into a nominally peacetime world. Fortunately, business prosperity did not collapse as feared. It was sustained by heavy government expenditure for demobilization, rehabilitation and social security, by heavy consumer spending caused by deferment of demand during the war, by reconversion of capital facilities to peacetime use, and by a high level of foreign trade caused in part by government loans. The unsettling factors in the situationstrikes, rising costs, uncertainty in foreign trade, rumours of war and many more—raised misgivings about the future.

Dominion-provincial relations continued clouded. In Aug. 1945 the dominion proposed that the provinces withdraw from levying taxes on personal and corporate incomes and on estates in return for a federal subsidy based on population and national income. The dominion would assume responsibility for health insurance, conservation of natural resources, and for full employment and a high national income. However, the more prosperous provinces of Ontario, Quebec and British Columbia, while recognizing some responsibility for provinces with fewer resources and lower standards of social services, were reluctant to give up too many of their potential sources of revenue. Alberta considered that the plan would frustrate the Social Credit reforms. Quebec was suspicious that its cherished rights to its own language, religion and educational system might be endangered, particularly since the English speaking majority did not adhere to the prewar tacit agreement on conscription. Other provinces feared they would become mere pensioners of the dominion without real control over their affairs. Consequently, further discussion between the dominion and all the provinces collectively was postponed, and in late 1946 interim agreements were being made with some of the provinces individually.

Any federal state has to maintain a nice balance between centralization and states' rights or provincial autonomy. In Canada the basic problem was aggravated by an area large relative to population, by the divergent interests of various regions, and by racial divisions. Add to this the whole enormously difficult problem of the most satisfactory relation of the state toward economic life and of various nations with each other and it became obvious that it would not be easy for Canada to solve its postwar problems in spite of the demonstrated capacity of its people to handle the difficulties of war.

Canadian Literature

Canadian literature during the decade 1937-46 showed many paradoxes when compared with the 1927-36 decade; there were fewer active writers but more writing, less paper but more books, fewer people with leisure but more reading, less contact with France but more French books. The 1937-46 decade also revealed a sharper sense of reality by Canadian writers, a truer focus of the nation's cultural energies, and a more acute awareness of fundamental issues on the part of the general public, than during the previous decade. These characteristics notably fostered and tempered the writing of the period.

Almost up to the impact of World War II, Canadian fiction had been preoccupied, with a few notable exceptions, by a nostalgic type of local colour in which the past was recreated romantically and sentimentally by writers who were antiquarians rather than social critics. These writers falsely imagined Canada as basically "habitant" or loyalist, or certainly provincial, and looked at Canada with introspective nationalism rather than extroverted nationalism.

They saw their country as an isolated phenomenon in the larger world, and thus saw it only partially if not inaccurately.

Although a change in outlook was becoming discernible just prior to World War II, the pressure of the war accelerated the process, and during the war Canadian literature became definitely cosmopolitan even when examining the dominion's own peculiar problems.

For instance, as one critic correctly declared, Earle Birney's narrative poem, David, published in 1942, depicted more than a particularized personal struggle to conquer a peak in the Rocky mountains; it was also an expression in universal terms of Canada's own national struggle to humanize its sometimes harsh and always impersonal environment. Gwethalyn Graham's novel, Earth and High Heaven, published in 1944, and Hugh MacLennan's novel, Two Solitudes, published in 1945, were deeply rooted in their local scenes of Montreal and Quebec and dealt penetratingly with specific local conditions; they also examined dispassionately but penetratingly problems of racial discrimination and religious intolerance that were world wide in scope.

The increase in quantity and the improvement in quality of Canadian writing during the 1937–46 decade, compared with previous decades, did not arise from any single cause, and certainly not from any single literary cause. A complex series of economic and political factors was the basis for the renaissance.

By the end of World War II, Canada had literally come of cultural age, with an entirely new feeling of national consciousness born of the war and Canada's participation in it. The desire for a Canadian flag and legislation defining Canadian citizenship were recognizable indications of this condition.

A distinctive Canadian spirit had emerged, and Canadian writers had learned how to express themselves in harmony with it.

Influence of Publishing.—Canada has two publishing centres, Montreal and Toronto, the former French and the latter English; and undoubtedly the economic effects of the war on the other major English-speaking publishing centres, New York and London, and the other French-speaking publishing centre, Paris, had much to do with

the 1937–46 expansion of Canadian publishing, which in turn influenced Canadian writing.

Increasing demand by British and U.S. readers for books by British and U.S. publishers cut into the supplies of potential exports of their products to Canada; and later the acute shortages of paper and labour further restricted export activities. Meanwhile, the Canadian reading public was expanding, and the English Canadian publishers were forced to depend more upon their own production efforts and less upon the import of books from London and New York to supply their markets.

During the decade, there were three firms publishing Canadian books in English for every firm doing so 25 years before. Moreover, the day of the 500 to 1,000-copy editions had gone. In the 1940s a Canadian publisher was not unduly alarmed when faced with a 10,000-copy edition; and, during the war years, many Canadian-produced titles of Canadian-written books sold more than 50,000 copies each, a phenomenon for Canadian publishing, compared with any previous period.

Furthermore, a reverse flow of books was set up. Instead of importing in large quantities, Canadian publishers began exporting in large quantities. In 1939, Canada exported bound and unbound books worth \$156,880; in 1945, Canada exported bound and unbound books worth \$1,027,700.

These figures revealed a new market not only for Canadian publishers but also for Canadian authors, and proved a direct stimulus to Canadian literature during the 1937–46 decade.

But providing an expanded market for Canadian books abroad was not the only way in which World War II stimulated Canadian writing; the market also expanded at home. Canadians had more to spend, because the per capita national income had increased from \$406 to \$675 in the decade. And while there was a shortage of many goods, there was a comparative abundance of books. Buyers turned to them. Moreover, books made ideal gifts for troops, and a generous wartime flow started in that direction,

There was another factor stimulating Canadian reading: Canadians, becoming more conscious of the role of Canada in world affairs, began studying its history and geography, its economics, its social and racial affairs, and all books relating even remotely to these subjects were eagerly sought.

Retail Canadian bookstores reported in 1945 that more than 30% of their total sales were of books published in Canada, whereas in 1935 the figure had been only 15%. The peak years of expansion in the Canadian book publishing industry were 1943, 1944 and 1945.

French-Canadian Publishing.—However, Canada is a land of two distinct cultures, and while Toronto was the centre of book publishing in English, Montreal was the centre of book publishing in French. During the 1937–46 decade, an astonishing expansion in Montreal publishing occurred.

Prior to 1939, except for school textbooks, religious books and some general books, French books were imported into Canada from Paris. In 1940, the flow of books from France to Canada was cut off. Booksellers were faced with the prospect of a book famine of indefinite duration. A unique step therefore was taken. The few active French-Canadian book publishers asked the Canadian custodian of enemy property to permit the publishing in Canada by special licence of French books, copyrighted in France and

523

therefore normally protected by the Berne convention.

Under this arrangement, between the years 1940-44, the members of La Société des Editeurs Canadiens du Livre Français, which embraced all the major French-Canadian publishing firms, printed more than 1,600 titles, in which first editions were seldom less than 3,000 copies and often ran 5,000 copies. That method of reprinting French titles in Canada under the Emergency War Measures act came to an end on Jan. 31, 1946, a year after the resumption of Canada-France trade.

The stimulus to French-Canadian publishing was not without its very beneficial effects on French-Canadian literature. During the decade, while there were many French-Canadian written books of a general nature, liveliest interest was in the novel as a literary vehicle. It became a true art form, with a number of successful works in the psychological, historical and sociological fields.

Among the outstanding French-Canadian novels of the period, the following were representative: Ils Posséderont la Terre by Robert Charbonneau, a psychological story; Tentations by Gérard Martin, depicting the conflict between sin and grace; La Fin de la Joie by Jacqueline Mabit, depicting the tragic friendship of two girls; Les Opiniâtres by Leo-Paul Desrosiers, a historical novel of Three Rivers in the mid-17th century; Un Homme et son Pêche by Claude-Henri Grignon, a sociological novel of peasant customs and ethics in the Laurentides north of Montreal; Trente Arpents by Ringuet (pseudonym of Dr. Philippe Panneton), a story of the prosperity and later ruin of a Quebec peasant in the early 20th century; Le Survenant by Germaine Guèvremont, of rural life near Sorel; Au Pied de la Pente Douce by Roger Lemelin, of life in Quebec city; Bonheur d'Occasion by Gabrielle Roy, of the working classes in Saint-Henri district in Montreal during World War I.

English-Canadian Writers.—English-Canadian writing during the 1937–46 decade was, because of the active nature of the publishing market, complex and ramified. In fiction, poetry, general literature, juvenile literature and in the technical fields, Canadian writers turned out an amazing number of books, most of them of high quality. Of course, some of the writers active in that decade had been writing for years, while others broke for the first time into the charmed literary circle.

In 1946 Clara Thomas published a book called Canadian Novelists which, although not entirely satisfactory in scope, nor always accurate in detail, was nevertheless a useful handbook about Canadian authors active in the quarter century 1920–45. The book reported on some 120 writers, and an analysis revealed some amazing facts.

Of the writers listed, 12 of importance migrated to the U.S. or Great Britain before 1937, 16 died before 1937, and 10 others died during the 1937-46 period. Some of the latter were still in their creative prime, and their deaths were consequently sad blows to Canadian writing. There were novelists like Charles W. Gordon, L. M. Montgomery, Frederick Niven, Stephen Leacock; there were poets like Constance Davies Woodrow, Annie Charlotte Dalton, A. M. Stephen, Sir Charles G. D. Roberts; there were general writers like F. H. Howay, Arthur S. Morton, Emily Carr.

Another astonishing fact revealed by Clara Thomas's Canadian Novelists was that more than 30 Canadian authors who had, prior to 1937, written one or more books which had earned critical acclaim and had sold fairly well disappeared entirely from the literary scene. These 30 writers had published a combined total of more than 200

books, and their silence must always leave a large question mark in the minds of the critics surveying and analyzing the 1937–46 period. It is true that senility may have overtaken a few of them, but newspapers, advertising agencies, schools and colleges, civil service offices and even the stage, swallowed up most of them: at least there was money in those jobs, even if there was not enough money in writing!

An equally striking commentary on the impetus which Canadian writing experienced during the decade was the fact that, although about 30 creative writers lay fallow, almost exactly the same number of new writers of capacity or promise appeared between 1937 and 1946. Some of these initiates published first books in 1937 and 1938 but the larger number first appeared during the war years, and the greater percentage of the latter during the close of the war and just after it.

Not-Too-Productive Writers.—Some particulars of these two main groups of writers—those active before 1937 and remaining active thereafter, and those who came upon the scene after 1937—will do something to indicate the characteristics of Canadian literature in the period.

In the first group, Morley Callaghan had published two collections of short stories and five novels prior to 1937. In that year he published More Joy in Heaven, and then fell silent as a novelist, a victim of Canadian radio. Similarly, H. A. Cody, who had published 23 books prior to 1937, published only one more in that year, Storm-King Banner, an adventure novel, and then lapsed into silence. Ethel Chapman published two novels prior to 1937 and then published With Flame of Freedom in 1938 and in turn fell silent, preoccupied with the problems of an editorial desk.

These illustrations were not isolated: John Murray Gibbon, prolific as a novelist and nonfiction writer prior to 1937, published only one book thereafter, Canadian Mosaic, in 1938, and then became preoccupied with song writing. Madee Macbeth, novelist and playwright up to 1937, published Wings in the West in 1937 and devoted herself to feature journalism thereafter. Pearl Foley, mystery-story writer, Archie McKishnie, naturalist, and Frank J. Tate, sociological novelist were other examples of this unfortunate creative drought.

During the decade some writers produced but little in permanent book form. Leslie Gordon Barnard and Will R. Bird, both preoccupied with short-story writing, wrote only two books: the former a collection of short stories called So Near Is Grandeur and the latter a novel of early English immigration to Nova Scotia, called Here Stays Good Yorkshire. Two other one-book novelists were Mabel Dunham with Grand Valley, a story of the Mohawk wars in southern Ontario, and Ethel Kirk Grayson, Fires in the Vine, a story of pioneering along Lake Ontario.

Other writers making only a limited contribution were Allan Roy Evans with All in a Twilight, a novel of pioneering on the prairies; John Coulter with a biography of Churchill and Turf Smoke, a whimsical novel about an Irishman who lived in a New York penthouse; Jessie G. Sime with In a Canadian Shack and The Land of Dreams, the latter being a psychological study of dreams; William Strange, with Canada, The Pacific and War and Into The Blitz, the latter a personal account of blitz-torn London.

Backbone of Fiction.—But there were a number of major authors who were writing before 1937 and who continued to produce throughout the decade following. Frederick Philip Grove wrote two novels, Two Generations and Master of the Mill, and his distinguished autobiography, In Search of Myself. Nellie McClung wrote More Leaves from Lantern Lane and The Stream Runs Fast, both auto-

biographical in content. Philip Child produced a mystery story, *Blow Wind*, *Come Wrack*, and a serious fictionalized study of dictatorship, *Day of Wrath*. Denis Conibear wrote two adventure novels, *Northward to Eden* and *Husky*.

Even more prolific "old timers"—writers well established by 1937—were William Lacey Amy (Luke Allan), Louis Arthur Cunningham, Mazo de la Roche, Maurice Dix, Frederick Niven, Laura Goodman Salverson, Arthur Stringer and Alan Sullivan.

These eight writers were really the backbone of Canadian fiction during the 1937-46 decade, producing a total of more than 50 books. Their more significant publications in the period were as follows: William Lacey Amy: Ghost Murder, Blue Pete: Horse Thief, Beyond the Locked Door, Vengeance of Blue Pete, The Tenderfoot; Louis Arthur Cunningham: Moon Over Acadie, Valley of the Stars, Discords of the Deep, Of These Three Loves, Sign of the Burning Ship, Marionette; Mazo de la Roche: The Very House, Growth of a Man, The Sacred Bullock, White Oaks Heritage, Wakefield's Course, The Saplings, The Building of Jalna, Quebec (not a novel), The Return of Jalna; Maurice Dix: The Kidnapped Scientist, The Fixer, Beacons of Death, This Is My Murder, Prologue to Murder, Murder Strikes Twice, Night Assassin; Frederick Niven: The Staff at Simpson's, The Story of Their Days, Mine Inheritance, Brothers-in-Arms, The Transplanted; Laura Goodman Salverson: The Dark Weaver, Black Lace, Confessions of an Immigrant's Daughter; Arthur Stringer (considered in the main stream of Canadian literature, though resident in the U.S.): Heather of the High Hand, The Lamp in the Valley, The Dark Wing, Ghost Plane, Intruders in Eden, Star in a Mist, The Devastator; Alan Sullivan: The Man at Lone Tree, With Love from Rachel, The Fur Masters, Cycle of the North, Three Came to Ville Marie, And From That Day, Cariboo Trail.

New Writers.—But while some Canadian writers were lying fallow during the 1937–46 decade, while some were passing permanently from the literary scene, and while some were shunted into nonliterary preoccupations, new and vigorous writers were rising. These could be divided into three groups: those who were part of the normal evolution of Canada's creative writing, those who were brought to the public eye partly as a result of the wartime boom in publishing, and those who joined the parade in the postwar part of the decade as a result of the continuing stimulus.

Among the important writers in the first category was Angus Mowat, who wrote Then I'll Look Up in 1938, and followed with Carrying Place in 1944, both powerful psychological novels. W. G. Hardy also came on the scene in 1938 with Turn Back the River, following in 1942 with All the Trumpets Sounded, both being historical novels of Biblical times. Another 1938 arrival was Gwethalyn Graham with Swiss Sonata, the setting of which was laid in a Swiss boarding school; a success which she followed in 1944 with an even more outstanding work, Earth and High Heaven, a novel of religious intolerance. Irene Baird was still another early arrival of the decade, with a light romantic story called John in 1937, which she followed with Waste Heritage in 1939, a vigorous novel of labour strife. In 1941 she published He Rides the Sky, a novel of World War II.

Much interest centred on the writers whose arrival on the literary scene was prompted by or coincided with the war. In the brief period some of them published as many as five books, and obviously were long-distance writers; others published only one or two books, and while critics regarded their appearance with enthusiasm, judgment regarding their creative staying powers was reserved. Among these latter were such novelists as Herbert Sallans, *Little Man*; Mary Quale Innis, *Stand On a Rainbow*; Wilfrid Eggleston, *The High Plains*; Judith Cape (pseudonym of Patricia K. Page), *The Sun and the Moon*.

Critics were free with their praises, and equally free with their expressions of doubt about staying qualities, when they examined the works of James F. C. Wright, Dyson Carter and Maude Hill Beaton. In the period Wright wrote Slava Bohu, a full account of the life of the Doukhobors in Canada, and All Clear, Canada, a personal report of a trip to England during World War II; Carter wrote Sea of Destiny, an analysis of the military strategic role of Hudson bay, and Night of Flame, a novel with scenes laid in a hospital; and Miss Beaton wrote From Cairo to Kyber to Celebes, a travel book, and Keep Your Quilt, Mary Anne, a novel of life on Great Manan Island, off the coast of New Brunswick.

The critics were lavish both in praise and in their certainty of further good work from Thomas Raddall, Hugh MacLennan, Dorothy Dumbrille, Bruce Hutchison, Franklin D. McDowell and Grace Campbell. In the period Raddall wrote two books of short stories, Pied Piper of Dipper Creek and Tambour, and three historical novels about Nova Scotia, His Majesty's Yankees, Roger Sudden, Pride's Fancy; Hugh MacLennan wrote a novel about Halifax during World War I, Barometer Rising, and a novel studying religious intolerance in Quebec, Two Solitudes; Dorothy Dumbrille produced two books of poems, Watch the Sun Rise and Stairway to the Stars, and a novel, All This Difference, about Quebec; Bruce Hutchison wrote Unknown Country, an impressionistic study of Canada as a nation, and Hollow Men, a novel about politics in Canada's capital; Franklin McDowell wrote two historical novels, The Champlain Road, about early missionary activity in Ontario, and Forges of Freedom, the central theme of which was the Watt Tyler revolt in England.

A literary phenomenon of this period was Emily Carr, retired British Columbia painter and artist, who wrote four autobiographical books, the latter two of which were posthumously published. The books were Klee Wyck, The Book of Small, The House of All Sorts and Growing Pains.

In 1944 there was one major new Canadian novelist, John MacDonald, whose Darkly the River Flows won a U.S. literary prize. In 1945, two new women writers appeared: Violet King, with a historical novel of Ontario in 1837, Better Harvest; and Grace Tomkinson, with a novel of English-French relations in Quebec, Her Own People.

In 1946, however, the flood came: no less than eight new novelists, nearly all of them young people, appeared on the Canadian literary scene. They and their works were Ralph Allen, Home-Made Banners; Constance Beresford-Howe, The Unreasoning Heart; Eric Cecil Morris, A Voice Is Calling; Lillian B. Thomas, New Secret; Joyce Marshall, Presently Tomorrow; W. O. Mitchell, Who Has Seen the Wind; Marion Greene, Down River Lies the World; Winnifred Bambrick, A Continental Review. Much was expected of these first novelists.

Nonfiction.—During the war period, of course, there were many books specifically relating to the war, both by new and by experienced writers. The more impressive of these were Wallace Reyburn's Glorious Chapter, Isabel Guernsey's Free Trip to Berlin, Amea Willoughby's I Was

on Corregidor, Leslie Roberts' Malta Spitsire, Matthew Halton's Ten Years to Alamein, William G. Carr's Checkmate in the North, L. B. Shapiro's They Lest the Back Door Open, D. F. Griffin's First Steps to Tokyo, Ross Munro's Gauntlet to Overlord, Leo Heaps' Escape from Arnhem, W. H. Pugsley's Saints, Devils and Ordinary Seamen, Grant Macdonald's Sailors. Edgar McInnis wrote six invaluable books covering the war year by year.

Most impressive general nonfiction of the period of the 1937-46 decade, besides the books above mentioned, were My Discovery of the West by Stephen Leacock, The Canadians by G. M. Wrong, Postscript to Adventure by C. W. Gordon (Ralph Connor), Two Ways of Life by W. J. Lindal, Persons, Papers and Things by Paul Bilkey, Canada, Europe and Hitler by Watson Kirkconnell, The Canadian Peoples by B. K. Sandwell, Never a Dull Moment by Kathleen Strange, Cape Breton Over by Clara Dennis, The Unguarded Frontier by Edgar McInnis, Friendship by Harry Symons, The Incomplete Anglers by John Robins, Sir Charles G. D. Roberts by Elsie Pomeroy, On Canadian Poetry by E. K. Brown, Partner in Three Worlds by Dorothy Duncan.

A number of significant collections of poems were published during the decade, chief of which were The Tree of Resurrection and Challenge to Time and Death by Audrey Alexandra Brown; The Fable of the Goats, Brebeuf and His Brethren, Collected Poems, by E. J. Pratt; The Legend of Lost Lagoon by Joseph Schull; River Without End by Leo Cox; By Stubborn Stars by Kenneth Leslie; The Wind Our Enemy and Calling Adventurers by Anne Marriott; Under the Sea by Arthur Bourinot; Personal Note and Grey Ship Moving by Charles Bruce; David and Now Is Time by Earle Birney; Who Dare to Live by Frederick V. Watt; News of the Phoenix by A. J. M. Smith; Night and Day by Dorothy Livesay.

During the 1937-46 decade the beginning of an impressive collection of Canadian juvenilia was well advanced. The more important items included Starbuck Valley Winter by Roderick L. Haig-Brown; A World of Our Own, Danger on the Coast and Canada and Her Story, by Mary G. Bonner; The Cruise of the Mamie L. by Helen Dickson Reynolds; By Paddle and Saddle by Olive Knox; Jory's Cove by Claire Bice; Sugar Shanty, Lefty and Lefty's Adventure by Louise R. Rorke; Arctic Adventure, Dark Treasure and Mystery Ship by William MacMillan; Jess by T. Morris Longstreth; Just Mary and Maggie Muggins by Mary Grannon; Swampy Cree Legends, Young Voyageur, Fur Trade Apprentice and Phantom Fur Thieves by Charles Clay.

Awards for Literature.—The effect during the 1937–46 decade of awards for Canadian literature was important. Most distinguished of these, even though they did not carry any monetary value, were the governor-general's annual literary awards, under the jurisdiction of the Canadian Authors' association. They were first given in 1937 for the best books published the preceding year. They were awarded annually throughout the entire decade, and consisted of a bronze medal in the fiction, poetry and general literary categories until 1943, when the general literature category was divided into creative nonfiction and academic nonfiction, making four medals. In 1943, because bronze was in short supply, silver was used for the medals.

In 1946, steps were taken to add a medal for the best juvenile book of the year. Other annual medals donated throughout the period included the Canadian Women's Press club gold medal, the Lorne Pierce gold medal, the Royal society gold medal for literature.

The only monetary awards of any significance were the Ryerson Press Annual All-Canada Fiction award, inaugurated in 1942 for \$500 and raised to \$1,000 in 1943. In the province of Quebec there were provincial prizes called the David prizes for English and French fiction, poetry, drama and general literature. These ran in value from \$600 to \$1,200.

Such literary awards did much to stimulate 1937-46 writing: the publicity given to the winning books, both in Canada and the U.S., resulted in good sales and provided incentive to Canadian writers.

Canadian-U.S. War Committees

Before World War II, relations between the United States and Canada were based less on common institutions than on the constant interchange of population, tourists, books and movies, across an unguarded and everpeaceful frontier. Wartime co-operation between the two countries arose from the desperate situation facing the world in 1940, when German power had swept through western Europe to the very shores of the Atlantic. It was based on the urgent necessity for curbing the aggression of the axis powers and concerting plans for the defense of the northern part of the western hemisphere. On Aug. 17, 1940, 11 months after Canada declared war on Germany, President Roosevelt and Prime Minister King signed the Ogdensburg agreement which brought into being the Permanent Joint Board on Defense. As a result of the Hyde Park declaration of April 1941, which recognized the need for further measures to co-ordinate the productive facilities of both countries if the utmost aid were to be given to the United Kingdom and the other democracies, the Materials Co-ordinating committee, the Joint Economic committees and the Joint War Production committee were established. The Joint Standing Committee on Agriculture and the Joint War Aid committee were not set up until March and Aug. 1943, respectively.

Permanent Joint Board on Defense.-It was clearly intended that this board's functions should extend beyond immediate wartime needs and should constitute the permanent advisory instrument for planning the defense of both the United States and Canada in the postwar period. Even before the United States entered the war, joint Canadian-U.S. measures were taken for the defense of the northwestern approaches of the North American continent. After Pearl Harbor a policy of the closest co-operation among all the armed services of Canada and the United States was initiated. The over-all plans for the defense of North America were drawn up by this board and implemented by the two governments. Recommendations of the board resulted in the building of the Alaska highway, the construction of a chain of air fields between Edmonton and Alaska, and construction of other operations in Labrador, Newfoundland and Alaska by U.S. and Canadian civilian and military forces. After the end of World War II, the United States and Canada continued to co-operate on joint defense measures against

any future attack, particularly across the Arctic regions.

The United States and Canada also co-operated closely in liquidating their joint wartime ventures, particularly the air route between the U.S. and Alaska and the installations connected with it. The Alaska highway, airfields and telephone lines were taken over by Canada on April 3, 1946. Canada paid for every permanent air facility installed by the U.S., and the United States did not request postwar bases on Canadian soil.

The Permanent Joint Board on Defense was set up with six U.S. members (four representing air, ground and navy forces, one the department of state and one acting as civilian chairman) and five Canadian members (representing parliament, air force, army, navy and department of external affairs).

Materials Co-ordinating Committee.—This committee was established on May 1, 1941, shortly after the Hyde Park declaration, to plan the over-all raw material supply and requirements program of the two countries and to iron out distribution problems arising from short supply. It was the agency which formally presented Canada's position to the Combined Raw Materials board. The three U.S. members represented the War Production board and the three Canadian members, the department of munitions and supply. The committee officially went out of existence on Dec. 31, 1945.

Joint Economic Committees.—Establishment of these committees was announced June 17, 1941. They were to harmonize economic controls, priority regulations, shipping problems, questions of tariff, duties and exchange, and generally to mesh production in both countries for the most effective prosecution of the war. Exploratory discussion of postwar problems led to the initiation by the committees of a joint Canada-U.S. study of the North Pacific area including Alaska, the Yukon territory and northern British Columbia. The project was announced on Jan. 25, 1943, and was to study the possibilities for the economic development of the region in the light of wartime changes and for the benefit of the two countries and the welfare of the inhabitants of the area. These committees were dissolved in March 1944, when it was apparent that other agencies had taken over most of their functions.

Joint War Production Committee.—This committee was first set up in Nov. 1941 as the Joint Defense Production committee by President Roosevelt and Prime Minister King pursuant to an earlier recommendation of the Joint Economic committees. The objective of the committee was to integrate and speed up munitions production in both countries. It was successful in reducing duplication, increasing the exchange of technical information, closing short-term gaps, and in rationalizing production to take advantage of the best facilities available in both countries. Ten technical subcommittees did the basic groundwork for the committee. These expert bodies covered aircraft, artillery, artillery ammunition, conservation, chemicals and explosives, small arms and small arms ammunition, naval shipbuilding, merchant shipbuilding, signal corps equipment and tank automotive. The eight Canadian members represented the department of munitions and supply and the department of external affairs while the seven U.S. members were from the War Production board, the war and navy departments, the air force, the Maritime commission and the Foreign Economic administration. The dissolution of this committee was formally announced by the two countries on Jan. 12, 1946.

Joint Standing Committee on Agriculture.—This committee was set up in March 1943 to keep in constant review agricultural and food production and distribution in

the light of war and civilian needs at home and in liberated areas. There were four U.S. members representing various agricultural and food agencies, while the four Canadian members were representatives of the department of agriculture and the Wartime Price and Trade board. This committee became inactive in Oct. 1943, when full membership on the Combined Food board was extended to Canada.

Joint War Aid Committee .- During the Quebec conference in Aug. 1943, President Roosevelt and Prime Minister King announced the formation of this committee. Its purpose was to consider problems arising out of the operations of Canada's Mutual Aid plan and United States lend-lease. It examined all calls for assistance on these agencies in order to prevent overlapping or duplication and kept each other informed on current commitments. The five U.S. members were from the departments of state and war, the War Production board, the Munitions Assignment board and the Office of Lend-Lease administration, and the six Canadian members represented the Canadian section of the Combined Production and Resources board, the Canadian embassy in Washington, the Canadian joint staff, the Wartime Prices and Trade board, the department of munitions and supply and mutual aid. Since the purpose of this committee was to study problems arising out of the operations of United States lend-lease and the Canadian Mutual Aid programs, its operations ended with the termination of these programs early in Sept. 1945. (See also British-U.S. War Boards.) (W. E. TH.)

Canadian Women's Services, World War II

World War II saw the organization of three Canadian women's military services, complementing the royal Canadian air force, the Canadian army and the royal Canadian navy. These were the royal Canadian air force (women's division), commonly called the "W.D.'s"; the Canadian women's army corps, nicknamed the "CWAC's" (pronounced "quacks"); and the women's royal Canadian naval service, popularly known as the "Wrens." These services were vital to the Canadian war effort because they freed for other duty clerical and similar ranks from the various men's services.

The W.D.'s.—The R.C.A.F. women's division was the first to organize, in July 1941, and before disbanding in Aug. 1946, it reached a total enlistment of 17,038. The W.D.'s were also the first to go overseas, 1,470 serving in that capacity, mostly in the United Kingdom. Many were assigned to the R.C.A.F. bomber group when it was organized in Jan. 1943.

The slogan of the R.C.A.F. women's division was "She serves—that men may fly." The service was an integral and component part of the R.C.A.F. itself, and all organization and administration was dovetailed, thus, eliminating duplication of records, authority and work. But the W.D.'s had their own officers and noncommissioned officers to supervise them and look after their welfare and health.

Rookies received five weeks' basic training at a manning depot, where they were issued uniforms, inoculated, taught to drill and march, given physical training, and learned service etiquette and service history. Special technical training was carried on at more than 100 other establishments scattered throughout Canada.

When first organized, the R.C.A.F. (W.D.) trained recruits in ten trades; at the peak of operations it was training them in 43. They became cooks, hospital assist-

ants, clerks, telephone operators, drivers, wireless operators, laboratory assistants, photographers, dental assistants, signal officers, equipment and accounting officers and messing officers. At air force headquarters in Ottawa, during the height of the manpower shortage, many men officers' positions were filled by women officers. On the majority of R.C.A.F. stations a W.D. officer was assistant station adjutant.

In the control towers of R.C.A.F. flying depots, W.D. meteorological observers charted the weather, airwomen in the flights checked the pilots "in" and "out" and kept a close record of their flying hours. In the equipment sections they handled engine parts. In the stores sections they gave out uniforms. In the maintenance hangars they repaired wing fabrics and worked on the engines. In the parachute sections they packed 'chutes.

The W.D.'s played a vital part in the Canadian defense system. The duty of keeping check on the position and course of every aircraft which approached Canada's North Atlantic coast was entrusted to clerks-operational.

As a consequence of duty well done, 13 W.D.'s were invested by the king with membership in the Order of the British Empire, 21 were awarded the British Empire medal and 40 were mentioned in dispatches.

CWAC.—The Canadian women's army corps was the second women's service to be organized, in Sept. 1941. By the time it was disbanded, in Sept. 1946, a total of 21,614 women of ten nationalities and four races had served, 1,907 of them in the United Kingdom, Italy and northwest Europe. Others had served in Newfoundland and in the United States. There had been companies, platoons or detachments in practically every military centre in Canada.

Contingent of the women's royal Canadian naval service saluting the Earl of Athlone, then governor general of Canada, during the ceremonies marking V-J day in Ottawa The slogan of the CWAC's was "Release a soldier for active service," and, as in the other women's services, recruits enlisted for the duration of the war plus one year. The corps had the same standing as any corps of active militia in the Canadian army, and it was the first time in the history of any army that women achieved a status equal with men. They took the same oath of allegiance, came under the same rules and regulations, and enlisted for service in any part of the world. They got trades pay and dependents' allowances on the same scale as male recruits. Besides basic training, the CWAC's received special courses in such subjects as photography, drafting, architecture, cartography, meteorology, radio, radar and film projection.

They served in about 50 different capacities, including clerks, laboratory technicians, drivers, orderlies, cipher clerks, wireless operators, recruiting officers, cooks, stenographers, waitresses, superintending clerks, draftsmen, mechanics, radio instructors, instrument mechanics, dental chair assistants, postal soiters and signals operators. It was a high compliment to the Canadian women's army corps that, when the United States army decided to organize a women's army corps, it used the Canadian service as its model.

Outstanding acts of heroism or application to duty won individual members of the corps the plaudits of the civilian population and recognition from the king of England; 62 CWAC's received appointments as officers or members of the Order of the British Empire, or received awards of the British Empire medal: 16 were mentioned in dispatches.

Wrens.—The women's royal Canadian naval service was organized in June 1942. By the time mustering out was reached on July 31, 1946, 6,783 women had served. Of these, 450 had been to England and Scotland, 450 to naval establishments in Newfoundland, 50 to New York

The Wrens were closely modelled on the women's royal naval service in Great Britain but they were not, like the British, merely an auxiliary service. They were an integral part of Canada's naval service, and Canadian

Wren officers were granted the king's commission and given naval rank rather than the British designations of superintendent, chief officer, first officer and so on.

The Wrens were given basic training aboard H.M.C.S. "Contestoga," which was operated in the traditions of all other land establishments of the royal Canadian navy. Located at Galt, Ontario, it was commissioned in Oct. 1942 as a training ship in the royal Canadian navy. It was unique not only in Canada but also in the British empire, as the first and only ship captained by a woman. The only male personnel on board were the stokers, a shipwright and plumber.

Organized to serve in clerical, administrative and domestic capacities, the largest group of Wrens consisted of general duty writers (naval term for office workers), and numbers of others served as messengers, messwomen, wardroom attendants and cooks. Wrens became motor transport drivers, laundry assistants, teletype operators, visual signallers, wireless operators, coders, sick berth attendants, sailmakers, operational plotters, draftsmen, training assistants and electrical artificers.

As the manpower shortage grew, the demands upon them increased greatly, with many of the girls filling posts vital to the success and safety of Canadian warships in the battle areas. A special detachment worked with the technical research establishment of the royal Canadian navy at Halifax, Nova Scotia.

Wrens manned the lonely and secret wireless stations which kept tab on the movements of U-boats in the Atlantic; from the high and wind-whipped signal posts overlooking the Atlantic they directed warships into and out of port; on enormous charts in operational headquarters of the various Canadian bases they plotted the movements of warships and convoys; in night action rooms they taught sea-going naval personnel the latest tactics and methods in the war against nazi U-boats.

For special work in the line of duty, three Wrens won the Order of the British Empire, seven the Member, Order of the British Empire, ten the British empire medal, and two won commendations.

THE MORALE of all the Canadian women's services remained high throughout World War II. The W.D.'s, the C.W.A.C.'s, and the Wrens kept in mind that by undertaking their military service they were freeing enlisted men of high health category for combatant or other duty, and in the days when Canadian manpower shortages were particularly acute that was essential. The success of the various Canadian women's services was measured in terms not only of the final victory they helped achieve, but also in terms of the high regard in which they were held by the men they released from office, ground and shore duty. And, finally, upon demobilization the Canadian government awarded the members of the women's services with gratuities and other re-establishment benefits on a par with the men of the armed forces.

Speaking to a military review on Canada's Parliament hill Aug. 28, 1946, Field Marshal Bernard Montgomery paid tribute to the Canadian women's services: "The contribution to the war by Canadian women was terrificabsolutely! The name of the Canadian women's services SERVICES, WORLD WAR II.) BIBLIOGRAPHY.-C. E. Whitton, Canadian Women in the War

stands very high in Britain." (See also British Women's

Effort (1942); Canadian Geographical Journal (Nov., Dec. 1943, Nov. 1944).

Canals and Inland Waterways

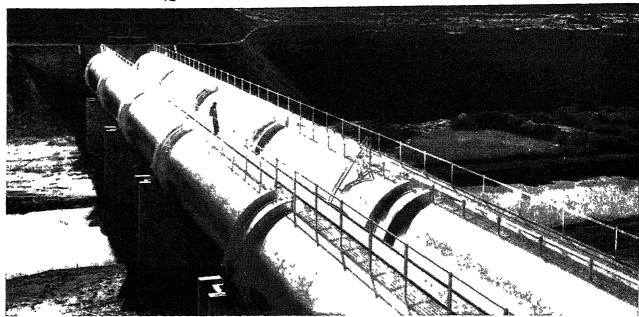

During the decade 1937-46, improvement and construction work on U.S. canals and inland waterways, most extensive in the world, was given great impetus by the nation's wartime industrial production. Not only did the inland and protective coastal waterways relieve the railroads of their overburden, they also afforded a means of coastwise waterway transportation that did not run the hazard of submarine attack. In addition to their value as carriers of commercial cargo, the inland waterways were used during World War II to float hundreds of seagoing vessels from newly constructed inland shipyards to the ocean. Shipyards and dry docks were constructed at points on the Mississippi, Illinois, Missouri, Tennessee, Cumberland and Ohio rivers, as well as on the Great Lakes. In the three years and nine months of war, these shipyards produced 3,943 war vessels of various sizes and descriptions, and 146 dry docks.

Channel improvements, for connecting channel construction along the rivers, bays, inlets, lakes and bayous of the Atlantic and Gulf coasts, gave the United States an inland waterway extending 2,300 mi., from New Jersey almost to the Mexican border. In 1936, traffic on the major canals and inland waterways totalled 276,300,000 tons. In 1944, traffic had increased to a total of 402,731,000 tons. During the years 1936 through 1945 (the last year for which figures were available at the end of 1946) traffic totalled 3,600,816,000 tons.

Principal commodities transported continued to be coal and coke, iron and steel, petroleum products, cement, sand and gravel, bauxite, cotton and grain. Other commodities moving in large amounts were sugar, molasses, coffee, sisal and sulphur. The industrial areas at St. Paul and Minneapolis received barge shipments from Alton, Ill., and terminals on the Illinois waterway, which connects the Mississippi with the Great Lakes. One of the largest increases in traffic on the Mississippi river system was the movement of petroleum products from refineries in the St. Louis area to Minneapolis, St. Paul, LaCrosse, Burlington and other consuming and distributing centres on the upper river. New movements of gasoline and fuel oil from Louisiana and Texas refineries to St. Paul and Minneapolis were developed in 1940. Other new developments in petroleum traffic were movements of gasoline from Lockport to East Peoria and from East St. Louis to Kingston mines. The transportation of gasoline from refineries in Texas via the Intracoastal waterway, Mississippi and Ohio rivers, Pittsburgh, destined for the Atlantic coast, was inaugurated to alleviate the shortage caused by diversion of coastwise tankers that formerly supplied that area.

Principal waterways in the United States were divided by the corps of engineers, U.S. army, into the Intracoastal waterways, inland waterways and Great Lakes connecting channels.

Intracoastal Waterways.-The Atlantic and Gulf Intracoastal waterways provide a protected channel for barge and other light-draught navigation following coastal sounds, bays, rivers and artificial channels. This canal system, extending for more than 2,300 mi. along the Atlantic

Sectional siphon of the All-American canal where it bridges a natural river near Calexico, Calif.

and Gulf coasts, afforded a channel 12 ft. or more in depth throughout the Atlantic coastal section from Trenton, N.J., to Jacksonville, Fla., and on the Gulf coastal section from Carrabelle, Fla., to Corpus Christi, Tex. Important coastal canals at the end of the decade included the Cape Cod canal, Mass., and the Chesapeake and Delaware canal, maintained and operated in the interest of ocean-going vessels.

Inland Waterways.-The principal inland navigable waterways of the United States at the end of the decade included the Mississippi river, the Illinois waterway, the New York state barge canal system, the San Joaquin-Sacramento river system in California and the Columbia river system in the northwest. The Mississippi river waterway embraced the river proper, the Illinois, Ohio, Tennessee, Monongahela, Allegheny, and Kanawha rivers and other streams. The Mississippi river had a channel suitable for ocean-going vessels upstream to Baton Rouge, La., and thence a channel for modern barge navigation to Minneapolis, Minn., and others in its principal tributaries. The Illinois river and waterway to Lake Michigan had a barge channel connecting the Great Lakes with the Mississippi river system. The San Joaquin-Sacramento river system, with an outlet to the sea through San Francisco bay, provided a deep-draught channel to Stockton, Calif., on the Sacramento river. The Columbia river had a deep-draught channel to Portland, Ore., and Vancouver, Wash., and depths suitable for commercial vessel traffic to the head of the pool formed by the Bonneville dam, and thence depths for barge navigation upstream to and including the Snake river. Lake Washington ship canal, Wash., provided a channel for ocean-going vessels within the city of Seattle extending from Puget Sound to Lake Washington.

Great Lakes Connecting Channels.—The Great Lakes have natural deep waters except in the connecting channels, artificially deepened where necessary to accommodate deep-draught vessels. They have an outlet to the Atlantic ocean via the St. Lawrence waterway and via Oswego and Erie branches of the New York state barge canal system and Hudson river. The connecting channels at the end of the decade were Keweenaw waterway, Lake Superior to Keweenaw bay; St. Mary's canal, Mich., between Lake Superior and Lake Huron; channels in the

Straits of Mackinac, connecting Lakes Michigan and Huron; Sturgeon bay and Lake Michigan ship canal, between Green bay and Lake Michigan; St. Clair river, between Lakes Huron and St. Clair; channels in Lake St. Clair; and Detroit river, connecting Lake St. Clair and Lake Erie. In addition, the Welland canal in Canada connected Lake Erie and Lake Ontario.

Great Britain.—The geographical and physical conditions of Britain are unfavourable to any large development of inland water transport in competition with rail and road haulage, and little was done further to develop this form of transport after the report of the royal commission on canals and inland waterways was issued in 1909. During 1937–46, new construction was on a very small scale. In 1905, the traffic carried on British inland waterways was 42,000,000 tons. It diminished rapidly up to 1926. Later the annual figures remained fairly constant until 1938, averaging about 15,000,000 tons (excluding

Manchester ship canal traffic). During the years of World War II, traffic originating on the waterways declined to an average of about 11,000,000 tons annually for the years 1940–45 inclusive; the figure for 1945 fell to just over 10,000,000 tons despite efforts to utilize water transport fully as a relief for traffic congestion on the railroads. Shortage of manpower alike for operating barges and for building and repairing them severely restricted the use made of the waterways during the war years. In July 1942, the government took control of the canals.

British Commonwealth.—Apart from Canada, the improvement of rivers and the construction of canals for navigation in the British empire was relatively insignificant compared with such developments as took place in Europe. Between 1937 and 1946, some further progress was made in Australia with the opening up to navigation of the Murray river (New South Wales and Victoria).

In Burma the Irrawaddy and its chief tributaries form important waterways. The main stream is navigable beyond Bhamo, goo mi. from its mouth, and carries much traffic. In India, the system of artificial canals, constructed mainly for irrigation and flood control, was used only to a very limited extent for transport.

Canada.—The canals controlled by the dominion government afford access to navigation from the Atlantic to about 1,890 mi. of waterways. More traffic passes up and down the Detroit river than over any other waterway; the traffic through the Welland canal and the locks at Sault Ste. Marie, linking Lake Huron with Lake Superior, Ont., in 1944 exceeded 128,000,000 tons, of which a little more than 112,000,000 tons used only the U.S. locks at Sault Ste. Marie. In 1943, 23,472 vessels passed through the canals of the dominion, carrying about 21,500,000 tons of freight, chiefly grain, petroleum products, iron ore and coal. Of the total waterway mileage under the control of the dominion government in 1946, 509 mi. were constructed canals.

The St. Lawrence waterway project had been under discussion for more than a generation. Canal navigation between Montreal and Prescott was limited to vessels of about 270 ft. length and 14 ft. draught. Under the St. Lawrence seaway agreement made in March 1941 between the U.S.A. and Canada, it was proposed to build an international ocean waterway at a cost then estimated at \$350,000,000, of which Ontario would contribute \$89,250,-000, the dominion government \$45,250,000 and the U.S.A. the remainder. New construction work could not begin on any large scale until the U.S. senate had passed the treaty, which had been under consideration for several years. Meanwhile, the Beauharnois power and navigation canal along the right bank of the St. Lawrence river, which was ultimately to form a link in the ocean waterway, was already in existence. The minimum depth of water in the channels of the waterway was proposed to be 27 ft. and the project included a further deepening of the Welland ship canal to 30 ft. With this great project realized, large ocean-going ships would be able to reach any of the Great Lakes by way of the St. Lawrence river.

Europe.—The development of inland water transport in Europe during 1937-46 was most marked in Germany and soviet Russia, though in Germany progress was slow before the Hitler regime and in soviet Russia canal construction did not begin on a large scale until the inception of the five-year plans. Canal construction and the improvement of existing waterways was also vigorously pursued in the Netherlands and Belgium up to 1940.

Soon after World War I, the League of Nations formed a transit section which for a time fostered and negotiated

agreements for the control and improvement of international waterways in Europe. A convention, concluded at Barcelona on April 20, 1921, on the Regime of Navigable Waterways of International Concern, laid down the principle of freedom of navigation and equality of treatment for all flags. In the years immediately preceding World War II, Hitler had denounced a large part of the agreements and conventions to which Germany had previously adhered. These conventions, including the Barcelona statute, became of little more than historical interest.

The increasing use of water power for the production of electric energy throughout the 20th century made it practicable to carry out many useful schemes of river canalization in European countries which would have been uneconomic but for combining hydroelectric power installations with dams necessary for making the waterways navigable. Such combinations of purpose might permit the economic development of many rivers in countries, e.g., India and the east generally, where major improvements for navigation had hitherto been impracticable.

The Rhine.-In 1926 Switzerland had completed the construction of a large river port at Basle in anticipation of the improvement of the Rhine between the Swiss frontier and Strasbourg. Navigation of the upper reaches above Strasbourg was complicated by a clause of the Versailles treaty by which France was authorized to build a lateral canal alongside the Rhine between the Swiss frontier and Strasbourg and to draw water from this river for the production of electric power. The river remained navigable in its upper reaches during the summer season only by barges of small draught. Three methods of improving the navigation were possible: (a) regulation and deepening of the river; (b) canalization; and (c) construction of a lateral canal. Swiss and German opinion favoured one or other of the first two solutions; the French pressed strongly for the last. In 1925 the control commission of the Rhine approved both river improvement by Germany and Switzerland and the construction by France of a lateral canal which was to be as free to navigation as the river itself. The first section only of the lateral canal was completed (1932): this was the most important from the point of view of navigation as it avoided the rocky bar of the Istein rapids below Basle and the locks accommodated barges of 1,200 tons capacity. The extension of the canal below Kembs was not carried out. In the meantime, Germany and Switzerland began improving the river itself to make it navigable throughout the year by barges of 1,200 to 1,500 tons capacity between Strasbourg and Basle, the objective being a minimum channel depth of 6 ft. 6 in. at lowest water level. This work, planned to be completed in 1941, was still unfinished in 1946. The Kembs barrage and locks suffered severe damage during the battle of Alsace in the winter of 1944-45. Repairs of the barrage and canal by the French were expected to be completed by the end of 1946. Repair of extensive war damage and removal of ruined structures still partly obstructing navigation were carried out in 1946 by German labour under the direction of the Allied control commissions.

The Danube.—In the riparian states of the Danube, the movement of industrial products downstream and of cereals and oil upstream produced a large increase in the river traffic in the years immediately preceding World War II. The European commission of the Danube, established by the Treaty of Paris in 1856, and the international commission set up in 1920 were still in being in 1946. The

former was concerned with the international largely technical control of the lower Danube from Braila to the Black sea. The system of international control by the commission was modified in 1938 by agreement among Great Britain, France and Rumania, effective control of the lower section of the waterway being transferred to Rumania. In 1939 Italy adhered to the modification and Germany was admitted to participation. The international commission did much good work in regulating the flow of the Danube, creating and improving navigable channels between Ulm and Braila and controlling the main river, between these points, and its tributaries. Under the two commissions, Danube navigation steadily expanded and grew more efficient, though traffic on the river never equalled that on the Rhine. War in 1939 suspended the work of both commissions, and in 1940 the river was the cause of acute controversy between Germany and soviet Russia which continued until Hitler's attack on soviet Russia in 1941.

Germany.—The total length of German inland waterways (1946) was about 8,100 mi. of which 4,660 mi., including 1,550 mi. of canals, were of first importance. The two main sections of the German waterway system (a) west—the Rhine and its supplementary canals and (b) east—the Elbe, Oder and their connections were linked by the completion of the Mittelland canal in 1938.

The project of enlarging the waterway made (1836-48) by King Ludwig of Bavaria for 120-ton barges, linking Bamberg on the Main with Kelheim on the Danube, was approved by the German government in 1922, but little progress was made until 1933. Following the occupation of Austria in 1938, the work was speeded up both on the canal section proper and on the canalized river Main; but in 1939 the project was still some years distant from completion, and small barges only could navigate the summit section. The enlarged waterway should have been opened to through traffic in 1945, but was still unfinished in 1946, though 1,500-ton barges could proceed up the Main as far as Wuerzburg. The length of the improved waterway from Aschaffenburg on the Main to Passau on the Danube was 380 mi. Canalization of the river Main and improvement works on the Danube below Kelheim had been substantially completed. The Danube below Regensburg was regulated by a dam with navigation locks constructed at the Kachlet rapids above Passau. The enlarged waterway had a potential traffic capacity exceeding that of any other river or canal system in Europe. Hydroelectric power installations were built in conjunction with many of the river dams, particularly those on the Main.

From the year 1935 onward, the German government made strenuous efforts to hasten construction. As a result, by 1940 a large part of the new canal and river works was in effective operation. The Mittelland canal, between the rivers Weser and Elbe, begun about 1890, was completed in 1938 by the construction of the last link of a waterway for 1,000-ton barges extending from the Rhine to the Oder.

River canalization works in progress in Germany from 1937 until their virtual cessation in 1944 included improvement of the upper Weser for 1,000-ton barges, begun in 1935, and of the middle Weser, begun in 1938; of the Neckar, for 1,200-ton barge traffic, originally planned to be completed up to Stuttgart by 1944; and of the Werra between Muenden and Wartha. The enlargement of the Dortmund-Ems canal from 700 tons to 1,500 tons barge capacity, begun about 1935, was so far advanced in 1940 as to make the southern section available to 1,000-ton

barges to and from the Mittelland canal; the northern section was expected to be completed by 1944. Vital sec tions of this waterway were heavily and repeatedly dam aged by Allied air attack during World War II; in 1946 repairs were not yet completed. The Masurian canal in east Prussia, begun before 1937, was by 1940 open to 400ton barges. In 1940, communication between the Odei and Upper Silesia was improved by the completion of the Adolf Hitler canal for 750-ton barges. Construction of a new canal to be known as the Oder-Danube canal started in 1939, but little progress had been made when the war ended. The deepening of the Ems-Weser canal to take 1,000-ton barges; the construction of the Elbe-Havel canal, also of 1,000-tons capacity; the low-water regulation of the Elbe and the improvement of the Oder navigation below the canalized sections up to standards required for 1,000-ton barges were completed or neared completion during the earlier years of World War II.

Water traffic in Germany mostly carried on the large navigable rivers and canals reached nearly 65,000,000 tons in 1910; by 1937, this total had risen to 133,000,000 tons For 1943, it was estimated at 180,000,000 tons, despite the cessation of overseas traffic to and from Belgian and Dutch ports and the reduced activity of German Baltic ports.

Czechoslovakia.—The canalization of the upper and middle Elbe (the Labe) and its tributary the Vltava was nearing completion in 1939. By late 1946 canalization had reached the town of Kolin and plans for further work had been completed.

Belgium.—The Albert canal, 70 mi. long, connecting the Belgian Meuse near Liége with Antwerp, was opened to through traffic of 2,000-ton barges in 1939 on the eve of the German invasion of the Low Countries: its cost was \$165,000,000. One important objective in the building of the canal, to provide a military barrier to invasion through the Netherlands, was defeated in dramatic fashion when invasion came. The Belgian government concurrently with the making of the Albert canal rebuilt the canalization works on the Meuse for 2,000-ton barges and extended them downstream, below Liége.

Netherlands.—Within a year of the end of World War II the ship canal from Ijmuiden on the North sea to Amsterdam was clear of obstructions and restored to navigation. The removal of war obstructions in the Rhine and Meuse and repair works on a considerable scale also made Amsterdam accessible by water from the Ruhr downward in 1945. Barges of up to 4,000 tons could then pass through the canal between the Rhine and Amsterdam.

In the interwar years, the Netherlands began and completed about 1935 the enlargement of many important canals and waterways and the construction of several new canals. Most of the works undertaken provided for the navigation of barges and other vessels of up to 2,000-tons deadweight capacity.

In 1932, the Netherlands and Belgium agreed to revise the 1839 treaty to the extent of permitting the feeding of the new Dutch Juliana canal from the waters of the Meuse in return for concessions made to Belgium which would enable other canals to be built in that country. The old dispute about the use of the Meuse waters was, however, not finally settled until 1937, when the Hague Permanent Court of International Justice held that each country was free to modify or enlarge a waterway situated entirely in its own territory, provided that the diversion

of water at the feeder and the volume to be discharged through the canal were not affected.

France.-In France, whose total length of navigable waterways in 1946 was a little over 7,000 mi., and where the capacity of barges in use on most of the canal system did not exceed 300-350 tons, little was done to increase the capacity of the waterways to take the large barges common in Germany and the Low Countries. One of the latest river canalization works carried out in France, on the Moselle from Metz to Thionville, provided only for barges of a maximum capacity of 350 tons. The project of the French government to make the Rhone navigable between Lyons and the Lake of Geneva made little progress except for the beginning in 1937 of the construction of the great Génissiat dam and navigation locks, still uncompleted in 1946. The project of improving the Rhone navigation below Lyons provided for a minimum navigation depth of 5 ft. 3 in.

U.S.S.R.-A vast program of expansion of inland navigation, the construction of new waterways and the improvement of others constituted important parts of the three five-year plans of the U.S.S.R. A large part of the projected works had been completed when Germany invaded soviet Russia in 1941. Information on the condition of these waterways and on the works completed or initiated after 1940 was scanty, but among the works in progress or completed between 1937 and 1941 were the following: the Moscow-Volga canal (80 mi.) begun in 1932 and opened to navigation in 1937: 190,000 workers were said to have been employed in making it; the Volga-Don canal (60 mi.) begun in 1938, to link the lower Volga with the Don, was to form one section of the Black sea-Moscow navigation; the Marinski canal system, a link in the waterway connecting Leningrad with Moscow, included the Moskva river navigation and was planned for completion in 1940; the Volga-Caspian canal, begun in 1939 to connect the navigable reaches of the river above Astrakhan with the Caspian sea; the Dnieper-Niemen waterway (315 mi.), with 30 locks, begun in 1939 to link up the river Yasiolda, a tributary of the Pripet, with the river Shara, a tributary of the Niemen (this waterway would form one link in the projected Baltic-Black sea navigation); the Dnieper-Bug canal (126 mi.) between the Dnieper and the western Bug, opened in 1940, provided an outlet to the Black sea for the products of western Byelorussia.

The improvement of the river Dnieper for navigation along its whole course begun in 1931 was still in progress in 1941. The new river port of Leningrad on the Neva, undertaken as a part of the third five-year plan, was nearing completion when Germany attacked soviet Russia in 1941.

Most of the canals newly constructed or enlarged after the inception of the five-year plans were designed for the transit of barges and other craft of 1,000 tons deadweight capacity or more. In 1946 the precise situation was uncertain, but the completion of the works included in the second plan would have increased the total length of the Russian navigable inland waterway system from 84,000 mi. to 101,000 mi. Passenger traffic on Russian rivers and canals remained important: in 1940 more than 70,000,000 passengers were carried by the river fleet. (See also Aqueducts.)

Cancer

The ten years 1937–46 witnessed a great increase in both the experimental and clinical investigation of cancer as one of the great problems of medicine still awaiting solution. Cancer thus far had resisted all attempts at a specific cure. Much was gained by education in the signs and symptoms of the disease especially directed toward the lay public. Diagnosis improved greatly during the decade, and the methods of treatment advanced rapidly, but a real control over the disease was lacking. A large proportion of those developing an internal cancer still died of the disease. Yet real progress was made; research enlisted the abilities of many experts in chemistry, biology and physics, and the financial needs of such investigation were being generously supported by public and governmental agencies.

Causation.—Scientific investigators of cancer agreed that this disease of man and animals is an alteration in the normal cells of the body. The view at the end of the decade was that the changes in the normal cells which occur before a cancer appears may affect only a single cell or a small number of cells and is of the nature of a mutation; that is, a permanent change in the structure and chemical nature of the cell. The alteration from the normal may be slight and the cancer cell once produced may carry on active secretory functions; thyroid cancer making thyroid gland hormone and liver cancer, for example, secreting bile. Once the mutation has occurred it is irreversible; that is, cancer cells do not change back spontaneously into normal cells, but continue a life of their own, which in animal cancers had been proved by inoculation to be permanent. Many animal tumours had been inoculated for 20 or 30 years through thousands of generations, the cells retaining all the qualities of the original cell from which the cancer sprang. In animals of a purebred strain it became quite possible to transfer cancer cells by grafting and have them grow freely in all the animals of the same species inoculated, but there are many which will grow only in the animal in which they have arisen, and others which can be transplanted only with the greatest difficulty into the same strain. The reason for the change of a normal cell into a malignant cell was not clear at the end of the decade. It occurs under various conditions capable of being studied by animal inoculation. By 1946 the most fertile producers of cancer had been a group of chemical compounds of complex type related to the alkaloids in their structure. In many cases they belonged to the great class termed the phenanthrene group (see monograph by L. F. Fieser, The Chemistry of the Products Related to Phenanthrene, 1936). These were the most potent agents and had been known to be active in man in crude form after tar cancer was described by Sir Percivall Pott in 1745. Some members of this group have very high carcinogenic properties and can produce tumours very rapidly in almost all

species of animals. In general, the time of appearance is correlated with the length of the normal life of the animal; that is, in mice most tumours develop very quickly, and with the same stimulus it takes a little longer for a rat tumour to appear. Only occasionally had tumours been produced in the larger animals, such as dogs, long after inoculation had taken place. The fact that the tumour cells are specific for the animal species in which the cancer arises and cannot be grafted into the subcutaneous tissues of animals of another species proved that cancer is not a communicable disease. J. B. Murphy, H. S. N. Greene and others had shown that cancer tissues could be transplanted into the membranes of the chick embryo, the eyes of guinea pigs or rabbits, the brain substance, etc., and grow for a time protected more or less from the destructive effects of the fluids of the body. But, under normal circumstances, it was impossible to graft a mouse tumour into the subcutaneous tissues of a rat and obtain a permanent growth, or a rat tumour into a guinea pig; in other words, there is a cellular specificity which is characteristic not only of the cancer cell but also of the normal cell. For this reason, for example, skin grafting on man is only practical with skin from the individual upon whom the graft is to grow; that from another person is very apt not to take. The only condition under which cells can be transferred from one person to another is in blood transfusion, but even here careful studies of the groups of blood types must be carried out or a fatal result may occur. Also the transfused cells remain alive only for a short time. Tissues of low vitality and with very little circulation, such as the cornea, can be grafted, but this is related to the anterior chamber and the vitreous graft of tissues from one animal growing in another, as just mentioned. Apparently, then, the alteration in the cell, or mutation, is a permanent change and nothing alters it.

The Cancer Cell.—A popular belief, continuing through the decade, was that a cancer cell is a very active poisonous cell just like the bacteria which cause various epidemic diseases. On the contrary, a cancer cell is a very fragile cell and is easily destroyed if it can be reached with sufficient radiation from X-ray or radium. Unfortunately this is not very often possible because cancer cells are widely distributed at a very early period in the beginning of the disease. This is why it is not possible to cure all cases of cancer by radiation.

There is no question, at least insofar as the human body is concerned, that a considerable number of cancer cells which have entered the circulation die because they cannot obtain nutrition unless conveniently furnished with sufficient blood supply. It had been long pointed out that in the neighbourhood of cancer tissues blood vessels could be found which contained dead cells. If it were not for this fact every cancer would be rapidly fatal. The cancers of the blood (leucaemias) furnish an example of a disease which is incurable because of the universal transfer of the cells throughout the circulation and their growth in practically all the tissues. Persons with such cancers can often be improved and may live a considerable time, even years with suitable treatment, but reported cases of cures are so rare that it raises a question as to the diagnosis.

Despite the fact that the cancer cell is a very sensitive one there are great differences among cells arising from different organs. Some are much more resistant to radiation than others. If an attempt is made to destroy resistant cancer cells in an organ, the final result is that the organ is destroyed at the same time that the cancer cell is destroyed, so that a cancer in which the cancer cells involve an important organ cannot be cured because a dose to kill

the cancer cell will destroy the organ. Small, slow-growing, superficial cancers do not spread rapidly throughout the body and frequently can be permanently cured by surgical removal or destruction by an electric spark or by the rays of X-ray or radium.

With the discovery of the phenanthrene group of carcinogenic substances it was obvious to suppose that cancers occurring in the human body might be caused by some similar substance produced in the body by chemical changes or introduced by food. One of the first investigations in 1935 was followed by apparent success. A Russian investigator, L. M. Shabad, extracted liver tissue from patients with cancer of the stomach, reasoning that any chemical product would pass to the liver and perhaps be held there. Benzol was used for extraction and after the evaporation of the solvent the fatty residue, dissolved in olive oil and lard, was injected subcutaneously into mice. A certain number developed malignant tumours. However, repetition of the experiment with normal livers and with tissues like the lung in persons who did not have cancer showed that a slightly carcinogenic material could be obtained in the benzol extract. It was found that with other solvents extracts of various organs from normal animals will give rise to a few cancers in mice and even lard may do so. Shabad suggested that possibly the extraction process or some contaminant in the solvent might be responsible, so this work had to all be controlled by using albino rats or other animals as a test object before it could be finally accepted. These animals are much less apt to develop spontaneous tumours than mice. In other words, what originally promised to offer an explanation failed, as the experiments showed plainly that there was no specific carcinogenic substance in the body.

It was not necessary, however, to assume that cancer in the human body is produced by a carcinogenic substance. A. J. Earle at the Laboratory of Public Health Service at Bethesda, Md., was not only able to watch the transformation of normal cells into malignant cells in tissue culture when the fluid in which these cells were growing was contaminated with a minute quantity of one of the carcinogenic chemicals, but stranger still, some cultures which had no contact with any carcinogenic agent apparently became malignant. If this extraordinarily interesting experiment were to be confirmed, it would wipe out the necessity of assuming any specific agent acts to produce human cancer. This means, in other words, that anything which causes an excessive and non-functional proliferation of cells may ultimately permit a change to take place in these growing cells which results in cancer. An interesting clinical illustration of this fact is seen in superficial burns produced either by hot water or by contact with hot metals. The scar of the burn may be in a perfectly healthy condition for many years until the skin is broken, and then because of the poor nutrition of such damaged tissue, a small ulcerated area remains. If not given prompt medical attention in the course of a year or so a cancer may develop in such a situation. It was not the burn which produced the cancer; the burn only produced a local condition in which healing would not take place. This gave the tissues a chance to attempt to repair the injury. In that attempted repair many millions of cells divided; one of these cells in the course of this division may, again for some unknown reason, possess the capacity of growing freely throughout the tissues of the body. This one cell, therefore, is the beginning of a cancer. This, in a rough sense, is a repetition of the old idea of the origin of cancer from irritation,

because cancers are frequently seen to develop in unhealed areas on the skin. They develop in ulcers of the stomach; they develop in polyps of the intestine which are irritated by the passage of faeces; they develop in the mouth under the irritating effects from the prolonged and excessive use of tobacco. The more careful the study of the antecedent situation, the more likely it is that such a continuity of events will be discovered.

In 1946 there was still a school holding that viruses are the cause of cancer. There was no question that, as Peyton Rous had originally shown, there is found in chickens a type of tumour which is transmissible by a filtrate which is cell-free. There are also some benign human tumours, like the contagious warts, which are known to be caused by a germ so small that it passes through a filter fine enough to hold back all cells.

In an interesting discovery, J. J. Bittner found that young mice from a strain which rarely or never developed cancer, when allowed to nurse from mothers of a high breast cancer strain, also were apt to develop breast cancer when they grew up. This extraordinary phenomenon naturally led to a large amount of experimental study of the situation. Bittner finally came to the conclusion that it was caused by the fact that breast cancer in mice, at least in some of the high-frequency strains, is the result of a virus and that in nursing the virus is transferred to members of the non-cancer strain, who then develop cancer. There was no dispute concerning the facts as observed, but final agreement on the nature of the transferring agent had not yet been reached. It was difficult to perform the parallel experiment in rats, and no one with even a minimum of scientific judgment would generalize from a single species of animals. Despite this lack of evidence that the phenomenon was in any way general, several papers appeared advising women in a family in which cancer of the breast had occurred to avoid nursing their female children. Such a recommendation was utterly without basis and added one more source of nervousness concerning cancer. S. Peller criticized this transfer from mouse to man from a statistical point of view, stating that apart from the milk factor in mice others were present which complicated the situation and rendered it doubtful that, in mice at least, any one agent could be incriminated. Peller enumerated heredity, age, hormonal activity, dietary and caloric factors which either promote or retard or even prevent the appearance of breast cancer in animals. He stated that cancer of the breast in the human female plays a minor part in the disease, only about 4% or 5% of women developing a primary cancer in that organ. About 15% die from cancer of some other organ, and some 78% to 80% never have cancer, so that apparently in women the milk factor, even if it should exist, is not as important as it seems in mice. Peller said that if there was any truth in the proposal made by L. Gross it would lead to the abolition of breast feeding. However, as breast feeding by 1946 was very much less frequent than it was a few years before, there was little likelihood that this milk factor in breast cancer was of any importance in the induction of cancer of the breast in human beings, especially as there was not the slightest evidence that a virus causes human cancer.

Another very interesting investigation was conducted by Peyton Rous and W. E. Smith. Ever since cancer had been studied microscopically it had been noticed that tumours of extreme complexity occasionally occur in the body of human beings, very often suggestive of structures seen in the embryo. Julius Cohnheim especially, among the older

pathologists, suggested that these tumours arose from cells of embryonal character lying latent in the organisms until some intercurrent factor released their inherent capabilities. Obviously the answer to this proposal was the injection of embryonic tissue into homologous animals. Occasionally some of this injected embryonic tissue grew for a short time, especially the cartilaginous fractions, but epithelium, usually after a short time of proliferation, quieted down to form an epidermal cyst. This had been so regular an occurrence that C. Oberling in his book *The Riddle of Cancer* dogmatically stated that there had never been a tumour of complex embryonic type produced by the injection of embryonic cells.

Peyton Rous felt, however, that possibly the embryo tissue needed some stimulus. When he implanted skin or bits of minced embryos and added a small quantity of carcinogenic chemical he obtained a variety of transplantable tumours containing a number of types of cells. Neoplasms developed rapidly, for example, after pieces of embryo stomach were grafted into a mouse. Many of these embryomata were transplantable and some metastasized. Sarcomas were less frequent than carcinomas. Rous believed that the rarity of malignant tumours at birth resulted from circumstances of intra-uterine life and to its brevity and not to any lack of capacity of the cells of the embryo to undergo neoplastic change.

H. S. N. Greene confirmed Rous's work. He transplanted a variety of embryo tissues and organs, including lung, stomach, intestine, muscle and cartilage. About 60% of the transplants fulfilled both morphological and biological requirements. Greene added that "embryonic tissues undergo such modification within 35 days whereas from 90 to 200 or more days are required before comparable changes appear in adult tissues" (Science, 101:644-645, June 22, 1945). A number of sarcomas were found, but Greene pointed out the sarcomas may arise under the conditions of the experiment from the connective tissue of the adult host rather than from the inoculated embryonic connective tissue. Greene also found that it was possible to transfer embryos either in whole or in part to the anterior chamber of the eyes or the testicles of rabbits or guinca pigs. The growths resembled teratomas and could be transferred serially into other animals. Similar results were obtained with human embryonic material transplanted to the eyes of rabbits and guinea pigs. It was impossible to transfer liver or the organs of internal secretion by this technique.

Tissue Specificity.—The discovery of a large number of carcinogenic chemicals led to some very interesting results in tissue specificity. For instance, methylcholanthrene and the immediate closely related group of phenanthrene compounds apparently are capable of producing tumours in all of the mammalia, at least in those available for laboratory experimental purposes. Alpha-naphthylamine, on the other hand, does not produce cancer when fed to animals, except in the bladder, and has no carcinogenic effect when injected subcutaneously. P-dimethyl-amino-azobenzene and 2-amino-5-azo toluene do not cause tumours when injected under the skin, but when they are fed to white rats, which are kept on a diet low in vitamins, they cause a cirrhosis. In the cirrhotic liver cancer develops. The cirrhosis and the cancer do not appear if the diet is a normal one. The eggs of Taenia crassicollis, a tapeworm parasitic in the cat, form cysts in the liver when fed to rats, and in the cyst wall some 17 different types of sarcoma had been found by 1946. The liver is an epithelial organ, but despite this fact out of thousands of sarcomata, only one carcinoma was found. On the other hand, an osteogenic sarcoma containing cartilage and bone was once discovered in the walls of one of the cysts of the liver after feeding tapeworm eggs.

Mixed Tumours.—For many years complicated tumours were all seen in man, chiefly in the salivary glands but also elsewhere; they were the subject of much theoretical discussion without any final solution of the problem. It was generally assumed by histologists that epithelial and connective tissue remain as independent types during adult life and that it is only during embryonic development that the distinction between the two is not always possible. A good many pathologists, including James Ewing, Pierre Masson, etc., had assumed, on the basis of morphological study of a variety of mixed tumours, that it is possible for epithelium to form a mesodermal type of tissue such as cartilage. W. F. Dunning, M. R. Curtis and M. E. Maun attempted an experimental solution of the problem with their large material of purebred strains of rats. Twentyseven malignant mixed fibro-epithelial tumours were available for this study.

Transplantations of the tumours were followed in some instances by separation of the two components. Metastases from these tumours either carried both components, epithelial and connective tissue, or they might result in a pure culture of one component of the original growth. In one case the carcinomatous portion of the tumour was carried by grafting for nine successive generations without showing any stimulating action on the fibroblasts of the new hosts. It is obvious that the original tumour was composed of malignant epithelial and connective tissue and that these elements were separable and both autonomous. It would seem that this demonstration of the possibility of segregation of two fractions of a complex tumour cast much more light upon the nature of these growths in the salivary and lacrimal glands than did years of argument.

Human beings from the time of the Pharaohs have suffered from a parasitic worm (Bilharzia) which enters the skin of the lower extremities and discharges eggs which enter the urinary bladder and set up an irritating inflammation in that organ, often followed by cancer. In Caribbean populations the eggs of a similar parasite do not irritate the bladder, but instead enter the mucous membrane of the rectum and cause carcinoma of the rectum. A slight difference in the parasite induces a cancer in a different site. Feeding urethane to mice greatly increases the incidence of cancer of the lung. There is, then, a certain amount of organ specificity in cancer-producing irritants. When it was remembered, however, that the U.S. public health service had published a volume listing more than 600 carcinogenic substances causing cancer in animals and in man, it became obvious that there can be no single cause of cancer, and that the only cause is the proliferation of tissues caused by some irritant substance, some disorganization of internal secretion and some hereditary malformation which favours slow reparative processes. During this multiplication of cells a mutation takes place and the cancer cell is formed.

Cancer in Man.—Knowledge of the differences in the occurrence of cancer in different organs and races had become full as regarded experimental animals, but it was still very difficult to get comparable properly controlled human material. A large number of very interesting observations were made, however. C. Bonne in Java, for instance, made statistical studies on large groups of indentured workers upon whom postmortem examinations are always made. He found that the greater proportion of the Chinese had cancer of the stomach, whereas the Malays, working under the same conditions, had cancer of the liver. The Malays also had a great excess, as compared

with the Caucasian races, of a very unusual type of tumour -a reticulum cell sarcoma which occurred as huge masses in the neck and was often rapidly fatal. The Negroes of Curação in the West Indies differed greatly from the white population in that they had an excessive amount of cancer of the upper digestive tract. It was found that 25% of all cancer deaths were caused by tumours of the oesophagus, a relatively rare condition in whites in temperate climates. The American Indian and the Eskimo had long been popularly supposed to have little or no cancer, but publications showed that they had the same amount as the white races. Such studies, while difficult to collect and analyze, were certain to cast some light on the causation of the disease and to be useful in diagnosis, the basis of all treatment. The publication of atlases, such as that of the French Cancer society; monographs, such as the one on bone sarcoma by A. Kolodny, for which the American Society for the Control of Cancer was responsible and the Atlas of Ovarian Tumors by G. Barzieai, were of great value in standardizing the microscopic diagnosis of tumours, thus forming a basis for judgment as to whether X-ray or surgery was the proper therapeutic agent and the results to be expected in the application of either.

Treatment: Surgical.—The strides made in the treatment of malignant diseases during the decade 1937-46 attracted much less popular attention in the daily press than the emotional articles on 200,000,000 electron volt betatron generators or radioactive phosphorus. Actually the treatment of cancer made very great advances, perhaps quite as much as in any other aspect of medicine. In the first place, the diagnosis of tumours had become very well standardized. By 1946, there were publications in considerable number giving the records of the results obtained by surgery on all of the important tumour groups. In this field the College of Surgeons had collected nearly 40,000 cured cases of cancer as forming a basis for estimating the capacities of surgery. Instead of reporting patients at the end of five years as cured, it was realized that ten years was a safer limit for a final computation, because a certain number of patients died after the five-year period had elapsed. Many of these were carried toward the ten-year limit by suitable X-ray treatment, the development of which was very marked.

Serum Diagnosis.—The fact that many internal cancers were not recognized until they were too advanced to cure led to an immense amount of energy spent in attempting to devise some chemodiagnostic method for cancer, just as the Wassermann reaction reveals the presence of syphilis, or the Aschheim-Zondek reaction the presence of a foetus or of a tumour composed of placental tissue. Despite every effort, a reliable test had not been devised by 1946, with the one exception noted. The chief difficulty was that all the tests gave a high percentage of false positives and thereby might lead either to unnecessary exploratory surgery or to cancer phobia. Few of the tests, even in the hands of the inventors, had given better than 75% of positive tests in well-developed cases of cancer. Certainly it would be extremely unwise to inform a patient of the possibility of a growth on so flimsy a basis, especially when the development of X-ray and other instrumental technique in diagnosis had been outstanding. The various methods of demonstrating lesions of the gall bladder and genitourinary tracts by the injection or excretion of drugs containing iodine or other opaque components had given very complete visualization of these regions, and certain optical improvements had made it possible to diagnose most of

the growths of the respiratory, lower intestinal and urinary tracts and to photograph for record purposes the lesions of the gastric mucosa.

Moreover, the great improvements in local and general anaesthesia, such as the intravenous use of pentothal sodium and similar products, permitted rapid exploratory operations for the removal of biopsy specimens or the exploration of accessible lesions with very little risk even to the seriously ill patient who could not stand a general anaesthetic. It became common experience to get biopsy material from the thorax, throat, bronchi, bladder, high-up rectal tumours and so on, which at the beginning of the decade were never obtainable. The mere demonstration of a carcinoma might not mean that the patient was necessarily to be cured, but at least he was going to be treated with intelligence and given every possible chance. No field was a better demonstration than that of surgery of the lung. While the number of people cured by excision of considerable lung tissue for a malignant growth remained small, nevertheless, all had died until the combination of the physiologist, the anaesthetist and the surgeon showed that the pleural cavity could be opened, the tumour resected, and-if the growth was sufficiently localized-the patient's life saved. The speed and effectiveness of modern surgery were certainly caused in part by the developments resulting from the handling of mass material during World War II.

The combination of physiological studies and surgery resulted in an extraordinarily interesting situation with regard to a very common type of cancer, that of the prostate. This was one of the most difficult fields in which to obtain cures, or even to afford a patient some relief. The prostate is situated in a complicated anatomical region so that extension of the growth to the pelvic bones takes place at a very early stage. C. Huggins found that the removal of the testicles in man caused an extraordinary relief from symptoms of the disease. In some instances individuals who were bedridden and taking large quantities of morphine without much benefit were able to resume their occupations. The phosphatase tests were useful in this connection as helping in the diagnosis and prognosis. It is probable that the removal of the gonads makes the bone metastases, which occur so early in carcinoma of the prostate, shrink somewhat and become slightly more sensitive to radiation, which is a great help because of the early involvement of the osseous structures in most of the patients. Morphological studies on the tumour removed after operation showed very considerable regression of the glandular structures-the explanation of the clinical improvements. Some patients received no benefit; many were made more comfortable for a time, and some became free of symptoms for several years or more. In judging the results it must be remembered that a certain number of cases of carcinoma of the prostate are found only after death from other causes, but there was no question that this was a forward step in the treatment of a very hopeless disease. There was no reason to expect, unfortunately, that any of the patients could be permanently cured. (The usage of properly high dosages of synthetic oestrogens by mouth in many cases apparently brought prostatic carcinoma under control.)

The great success in this field led to the administration of testosterone to women with carcinoma of the breast. Unfortunately there was not infrequently a slight slowing of the growth of the breast tumour under the influence of large doses of testosterone. This led to the treatment with

this drug of a certain number of patients with small tumours, the individual being delighted to escape surgery; but testosterone does not permanently inhibit the growth of a breast cancer, and by the time this fact is discovered the patient has lost her opportunity for surgical cure. There are also some very unpleasant concomitant effects produced by large doses of the drug which are extremely distressing both to the patient and her relatives. It is therefore always wiser to do a radical mastectomy as soon as a positive diagnosis can be made, and then if it is thought desirable, testosterone can be administered. Apparently this chemical reduces the sensitivity of the skin to X-ray, and larger doses of that agent can be given without producing severe skin irritation. It therefore may be of some slight value in the radiation treatment of post-operative recurrences.

Radiation Therapy.-Advances in radiation therapy during the decade 1937-46 were not so striking as in surgery. The principles underlying treatment had been laid down by Claude Regaud and his school 30 years before the end of the decade, but the treatment so outlined was tedious both to the patient and the operator; it was also expensive to the patient and destructive to apparatus, and only in later years received any widespread recognition. The studies of the Crocker laboratory, using biological materials, showed the basic fact that if back-scatter was eliminated, a roentgen unit of X-ray energy was just as effective in killing cells at 10,000 volts as it was at 1,000,000. The advantage of 1,000,000 volts was purely in one direction, and that was that the back-scatter against the skin from the impinging dose was only 3%. In other words, nearly all of the X-ray energy enters the body of the patient, whereas at 200,000 volts 35% is scattered back against the skin from the deeper tissues and thereby damages that tissue and limits the application of the radiation through the skin at a much earlier stage than at the higher voltage. In most instances it is possible to meet this difficulty by using multiple portals, but there are situations, such as arise in the treatment of carcinoma of the bladder and certain tumours of the nasopharynx, which need heavy doses and can better be handled by a voltage above 200,-000. The objection to the 1,000,000-volt machine is its initial cost, the expense of operation, the large amount of protection from scattered rays required for patients and personnel, and the fact that it is unnecessary except in special instances; in other words, such machines need an endowment. While radium gives off gamma rays at about 1,250,000 volts, the price was still too high in 1946 for use as a pack. Unless large quantities were available, proper geometric distribution of the radiation could not be obtained. Perhaps the cyclotron or the uranium pile would develop a radioactive element giving large quantities of gamma rays, with a half-life of 20 or 30 years and producible in quantity for a low price. In that case it would be an advantage to return to the use of radium packs, the advantage of which lay in the fact that, as Regaud showed in 1913, prolongation of the treatment is one of the important factors. Long external exposures with a pack can be made on bed patients which combine convenience and prolonged, slow treatment.

Long after Regaud, D. den Hoed and D. Levie showed by tests on animals that radiation given at a rate of 20 r. per minute caused much more permanent normal tissue damage than the same dose when given at 5 r. per minute and was less effective in curing the cancer. The atrophy of the skin was always more marked on the side of the rapid radiation; hyperkeratosis was rare at the lower rate; necrosis caused by endarteritis was less in the slow rate

areas, and the experiments definitely showed that less permanent injury is inflicted on the tissues by radiating at 5 r. per minute than at 20 r. Most carcinomata required 8,000 roentgen units for their destruction. That amount was within reach of external radiation therapy. It was often more convenient to obtain this amount by the use of radium emanation seeds which could be left in situ or by combination of X-ray and removable radium needles. Some tumours, like carcinomas of the mucous membranes of the gastrointestinal tract, required more.

Cancers of this region therefore were out of reach of radiation therapy. Palliation could be accomplished but cure could not be expected. Eight thousand r. meant 40 treatments of 200 r. which takes 40 minutes at 5 r. per minute. Many patients would not persist in such a treatment. They said that X-ray caused cancer, but vast numbers of patients had been radiated with X-ray and radium and had never had cancer develop afterward. Overdosage with destruction of the tissues was the basis for the cancer, and rapid administration was one of the reasons for serious injury to the skin.

Much was hoped for the radioactive elements produced by the cyclotron, but the employment of intravenous radioactive material had been shown to be dangerous by W. Falta and those with the most experience were, in 1946, beginning to abandon its use as uncontrollable and in many instances dangerous. The same was true of neutrons. The betatron was cited in the daily press as giving voltages of 200,000,000; this was not the voltage in the ordinary sense, however, but electron volts. As radium gives off electrons of almost the same velocity, there was no probability that such electron beams would be of practical value, for the early use of unscreened radium resulted in a series of destructive burns. Physicians had long since learned to filter off the beta rays from radium with a considerable thickness of heavy metal. Improvements then in the use of radiation were great, though their adoption had been slow. Many radiotherapists could point out patients who had survived diseases of the lymph node type, leukemias, even inoperable carcinomata, living for 10 or 15 years; patients with Hodgkin's disease restored to health for long periods of time, and patients with recurrent carcinoma of the breast cured for 10 or 15 years, bone tumours cured without operation, epitheliomata of the skin, lip, tongue, tonsil and so on cured apparently permanently. On the other hand, there were fields into which radiation could not enter. These included most of the brain tumours, cancer of the lung, of the gastrointestinal tract and prostate, and most of the bone sarcomata. All these still belonged to surgery, if surgery was possible. But the situation in 1946 was far from that of the days when patients had to be told that a small recurrence on the chest or a node in the neck was a death warrant. Many could now be assured of comfortable and useful life for many years by the intelligent use of radiation.

Curative Sera.—On the analogy of the specific antibodies obtained from bacteria, like diphtheria or tetanus antitoxin, pneumonia antiserum, etc., innumerable attempts were made to obtain similar protective or curative sera for cancer. While in general no antibody had been found which had a definite lethal effect on growing tumours, occasionally an observation was made which suggested that the long search might some day be rewarded. For example, J. G. Kidd reported that some rabbits may develop an inhibitive antibody in the blood after inoculation with cell-free saline extracts of the Brown-Pearce tumour which prevents the subsequent inoculation of the tumour. The protection, however, was not always complete and cures

were not obtained. Similar destructive action on growing tumours in mice was obtained by R. Lewisohn and coworkers using various toxic bacterial products. The effective intravenous dose was accompanied by so high a mortality in the treated animals that no tests on human beings were made. Apparently the action is allergic in nature, the tumours often being converted into haemorrhagic sacs because of damage to the smaller blood vessels which ultimately thrombose. Evidently surgery and radiation were the only effective curative agents at the end of the decade. (See also BIOCHEMISTRY; MEDICINE; RADIOLOGY; UROLOGY; X-RAY.)

Candy

Annual sales of confectionery in the United States nearly doubled in the ten year period from 1937 to 1946, when 1,482 manufacturers, employing 70,000 persons, produced 2,400,000,000 lb. of candy valued at approximately \$625,000,000. The industry reached an all-time high in 1944, when the volume was 2,804,000,000 lb., valued at \$658,000,000. In 1937, 1,200 manufacturers made 2,050,000,000 lb. with a wholesale value of \$321,000,000.

Table 1.—Estimated Confectionery Production, Per Capita Consumption, and Value of Sales, 1937–46

Year	Production (millions of pounds)	Per capita consumption (pounds)	sales value (millions of dollars)	Average value (cents per pound)
1937	2.010	15.5	321	16.0
			321	10.0
1938	1,955	15.0	298	15.2

1944	2,804	20.5	658	23.5
1945	2,562	18.7	620	24.2
*1946	2.400	18.7	625	25.0
*Estimated.				_5.0

Elsewhere in the world, however, candy manufacturers did not fare as well. In fact, from 1939 to 1945 very little candy was made in any country outside the United States, Great Britain, Latin America and Germany. At the same time, candy produced in the United States and Great Britain during the years of World War II was used to a considerable extent (some 20%) in the war effort. By the same token, candy and chocolate also proved "instruments of war" for the Germans. In each case, science and research were given full play, and as a result, wartime developments enhanced the importance of candy in nutrition during peacetime. In the United States, candy manufacturers produced various types of rations, including ten-in-one, K, C, D, air crew lunch, life boat and parachute. Developed through research by means of joint government-industry co-operation, these rations came in forms of bars, solid chocolate, fudge, caramels, jelly drops, hard candy and sugar-coated peanuts. They came in specially prescribed sizes and were packed in prescribed packaging and packings to withstand various temperatures, climates and shipping conditions. Fortification, by means of added vitamins and minerals, played a major role in the production of candy and candy rations for the armed forces of the United States and Great Britain.

In addition to using candy and candy rations as sources of food and energy for its armed might, Germany provided its forces with candies that contained large quantities of caffeine and other drugs to keep them awake and alert during difficult combat sieges. Unlike the United States, Germany permitted the use of saccharin and other nonfood substitutes in confectionery. In the United States, the use of such nonfood sweetening agents in candy (and other foods) was specifically prohibited under the Federal Food and Drug act, as well as under all state food laws.

The United States remained by far the most important candy centre in the world. Compared with the 1,482 candy manufacturers and plants in the U.S. at the end of the decade 1937–46, there were 1,739 plants throughout the rest of the world, divided by nations as follows:

Argentina

In addition to manufacturing the largest quantity of candy, the United States also produced a greater variety of confections than any other nation. For example, the United States made solid chocolates, hundreds of varieties of chocolate-covered candies, many types of bar goods, different classes of hard candy, jelly beans, pan work, nut products, seasonal goods, stuffed fruits, glacé candies, iced goods, pops and suckers, taffies, toffees, etc. Compared with this, other countries were noted for only a few varieties of candy. To illustrate, England continued to make mostly solid chocolate bars and toffees. (Incidentally, England made more coated goods than the United States, where the consumer had learned to like hard candy and uncoated soft goods almost as much as chocolate coated confections.)

In soviet Russia and the other Slavic countries, hard candy, including plastic and filled, remained the most popular. In the Netherlands, coffee and a combination of chocolate and coffee candies continued to rate very high in popularity. In Germany, solid chocolate bars led the field in consumer preference and production. In France, perfumed candies met with general consumer acceptance, but were practically unknown in the United States and other English-speaking countries.

During the decade, however, there was a notable change in consumer candy preferences throughout the world. Responsible for this trend were the U.S. troops stationed in the four corners of the earth. With more than 20% of the candy production of the United States shipped to troops in all parts of the world, American candy became very popular, with the result that manufacturers in various countries began to make, or plan to make, American types. Plans were also afoot by American manufacturers to export candies on a greater scale in the world market as soon as sugar shortages were eliminated and other production difficulties were overcome.

Candy also became a major item among the Latin-American countries, particularly in Cuba, Mexico and in the Argentine. Before World War II, there were fewer than six candy plants in Mexico. In 1946, there were more than 150. In Cuba there were about 100 plants operating in 1946, as compared with only a handful before the war. Most of the confections made in Latin America were of the hard candy type.

Inversely, the war years resulted in new trends in candy production in the U.S. markets. The decade saw the establishment of many plants in the United States by European refugees who brought with them the knowledge and craftsmanship they had used for generations in Europe, particularly in Austria and France. The candies introduced by this group of manufacturers, numbering more than 100, were known as "continental types"—moulded chocolates made in specially designed metal moulds. Because of the increase in importance of this type of candy in the United States, new machines were invented to simplify and speed its production.

Nonmelting and Nutritive Candies.—One of the most revolutionary developments in the candy field during the decade was the introduction of a type of candy that would withstand extreme temperatures, both in the tropics and the arctic climates. While the development of candies that would hold up well in cold climates was not a difficult problem, the perfection of a confection that would meet the standards required in the tropics presented a problem

of great complexity. However, it was solved, and the product used by the soldiers in the jungles of Africa and other tropical climates had a low melting point and could withstand temperatures as high as 120° F., and sometimes even higher.

Helping greatly in improving the keeping quality of candy rations during the war was the use of a product referred to as the 100-hour shortening. This was a hydrogenated vegetable oil able to stand exposure to active oxygen for 100 hours without showing deterioration or rancidity. Able to withstand heating to 400° F., without change in colour or flavour, a shortening of this type stood up under long storage periods.

The high melting point or nonmelting coating for bar goods was another product which gave improved keeping qualities to candies shipped abroad. By adding to the mechanical strength of the bar in keeping moisture and oxygen from penetrating the centres, coatings of this type withstood strenuous storage conditions and protected the centres of the bars. At least one manufacturer developed a real chocolate coating having nonmelting properties.

During the war, the Research and Development laboratory connected with the Chicago Quartermaster depot developed a process which resulted in a nonmelting type of chocolate bar able to withstand high temperatures. Because commercial chocolate bars had a very low melting point, this was no easy job.

The decade also saw candy receiving greater acceptance from the point of view of nutrition. The U.S. department of agriculture, with the aid of the National Confectioners' association, established a number of research and experimental stations for the purpose of developing candies that would have greater dietary values and, at the same time, consume larger amounts of agricultural products, particularly those types of plant and vegetable life that had not hitherto been used in the manufacture of candy.

The stations were located in Illinois, California, Alabama and Louisiana. As a result of these experiments, soybean products, pulverized wheat hearts, cottonseed flour, peanut flour, sunflower seed meal, fruit concentrates, yeast, pectin and other ingredients were added to creams, fudge, nougats, caramels, jellies and other types of candies, making for better balanced foods while retaining the taste-appeal which the U.S. expected of all candies.

Experiments to find possible new ingredients containing natural plant constituents—protein, fat, carbohydrate, minerals and vitamins—continued constantly in the effort to produce finer, more nutritious confections.

An interesting development, also a result of these developments, was the introduction of a starch sponge for potential commercial use in candy and other foods. This starch conversion product could be used for several purposes. In its dry state it had a crispness that imparted crunchiness to candies and crackerlike wafers. When shredded, the dry sponge could be used like shredded coconut or shredded nutmeats. Whether ground or shredded, it could be incorporated into chocolate candy coatings or candy bars to improve their texture and their ability to withstand extreme variations in temperature. Showing promise as a stabilizer in confectionery coatings and icings, the starch sponge could be used as a carrier for flavouring extracts and in chocolate, soya and wheat flours, vitamin preparations and fruit, vegetable or meat concentrates. Such ingredient materials were added to the starch paste before it was converted to the sponge state by freezing and drying.

By impregnating starch sponge with sweet chocolate, a new type of confection was made. This chocolate confection was crunchy, disintegrated rapidly in the mouth without becoming gummy and did not have the cloying sweetness of the chocolate alone. Compressed sponge is a concentrated carbohydrate and, as such, had obvious possibilities in emergency rations and sportsmen's packs.

For the first time in the history of the candy business, an evaluation was made of the nutritive value of candy ingredients. While candy had usually been classed as an energy food, research and changes in production formulas during the decade, plus the addition of new ingredients, increased the protein, fat and mineral content to an appreciable extent.

Chocolate, eggs, milk and nuts, all used in candy, are sources of essential body-building proteins. Nutrition authorities grouped nuts with peas and beans as economical protein foods to be used occasionally instead of meat, poultry or fish. The candy industry used about 250,000 tons of all kinds of nuts in a year.

The caloric content of candy was derived from many sources. The fat supplied by butter, chocolate, cream, eggs, oils and nuts contributed to its energy value. Fats are needed in the diet for certain essential fatty acids. They also act as carriers of some of the vitamins and are concerned with the utilization of carbohydrates.

Many candy ingredients also contained some or all four of the following minerals: calcium, phosphorus, iron and copper. Table II shows the relative nutritive values of eight candy ingredients, as compared with an average taken from ten candy items.

To produce 2,500,000,000 lb. of candy annually with an approximate wholesale value of \$625,000,000 and a retail value of \$1,200,000,000, the candy industry used ingredi-

ents at an approximate cost of \$300,000,000. Cane sugar was the largest single item in this group, accounting for about 800,000,000 lb. Corn syrup was the second most important item, with 700,000,000 lb. used annually.

The candy industry in the United States also used 230,000,000 lb. of chocolate, 6,000,000 lb. of eggs, 400,000,000 lb. of milk, 30,000,000 lb. of fats and oils and 10,000,000 lb, of fruits annually. (See also Cocoa.)

Cane Sugar

See SUGAR.

Canning Industry

In the period 1937-40, there was no noteworthy change in the overall United States canning production although steady increases in size of pack occurred in fruit juices, fruit and vegetable specialties and milk. Undoubtedly influenced by the war situation, abrupt increases occurred in 4941 in nearly all packs, resulting in a total of 468,100,000 cases as against 384,100,000 cases in 1940. From this point there was, with the exception of the pack of 1943, a persistent upward trend, with the peak in 1946. Fruit juices showed exceptional gains in this period, and gains for the milk pack were maintained. The fish packs were remarkably constant over the ten-year period.

U.S. and territorial canned food production during the ten-year period 1937–46, including canned vegetables, fruit, fish and milk, is given in the accompanying table in terms of million standard cases.

United States and Territorial Canned Food Packs, 1937–46* (Million standard cases)

In view of the widespread geographical distribution of armed forces of the U.S. and the food needs of Allied nations, attention centred not only upon the food packs of the U.S. but the production elsewhere. This was particularly true in regard to Australian production, which was depended upon for subsistence of U.S. troops in the South Pacific. Canadian production was of importance also in supplying substantially the requirements of the British armed forces. Canning in Great Britain proper was at a low ebb after 1939, but with the actual level of production unknown through lack of reliable statistics.

In Australia, prior to World War II, approximately 10,000,000 lb. (330,000 cases) of canned vegetables were produced by some half-dozen canneries. By 1944, the production had mounted to 113,000,000 lb. (4,000,000 cases) from

59 canneries. Carrots led the list of canned vegetables at 46,000,000 lb., with beans next at 12,000,000 lb.

Australian production of canned peaches, pears, apricots and pineapple during the 1938-45 period was as follows:

																	1	P	r	0	Ċ	lu	C	ti	0	n				
Year												(Λ	1	ii	l	i) [ı	s	t	aı	ı	l	ıγ	·d	С	as	e	s)
1938																						3	٠4							
1939																														
1940																		•	•	•		. 3	.0	•						
1941															•					•		3	. 1							
1942											•				•				•			3	.3							
1943																	٠					. 2	٠5							
1944																		•		•		2	4							
1945																			•	•		2.	.3							

As further index of the status of the canned food industry in Australia as compared with prewar years, usage of tinplate in 1946 was at the rate of 115,000 long tons per year as against 50,000–60,000 long tons prewar, with 92% used as food containers.

Canadian production of canned fruits and vegetables during the period 1937-44 was as follows:

	Fruits	egetables
	(Pack in millions of ca	ises)
1937	2.1	. 14.4
1938		.14.0
1939		.12.2
1940	4.7	. 15.2
1941	4.5	.20.9
1942	2.1	. 18.6
1943		.14.7
1944		.22.0

The 1945 packs were estimated to be somewhat lower than in 1944.

During the decade of the '30s, production of pineapple averaged about 14,000,000 cases annually. Of this amount, slightly less than 10,000,000 was U.S. production, chiefly in the Hawaiian Islands. British Malaya and Formosa accounted for three-quarters of the production in other countries, with most of the remainder from the Philippine Islands, Australia and Cuba. No information was available as to wartime production in Pacific areas except for the Hawaiian Islands.

Prior to World War II, considerable quantities of tomatoes and tomato paste were canned in Italy. No information was made available as to production during the war, but reports indicated no immediate exportable supplies following the end of the war.

Utilization by the Armed Forces.—To attain complete mobility and constancy of food supply during the wartime period, U.S. armed forces relied on canned foods to the largest extent possible. The basic, peacetime ration utilized many perishable foods. Because foods for wartime use had to withstand shipment and storage under the most adverse conditions for periods ranging from nine months to more than two years, the basic wartime rations were composed of nonperishables—canned meats and canned and dehydrated fruits and vegetables.

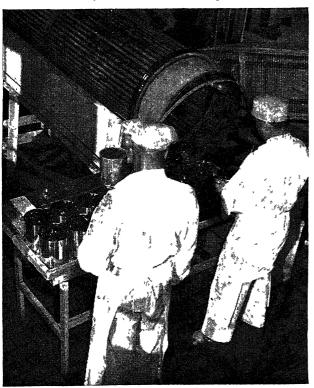

To ensure against bacterial spoilage which might occur during storage of canned foods at elevated temperatures, the U.S. army quartermaster corps equipped mobile laboratories for bacteriological surveys of the canning plants during the canning operations. Canned foods examined by the laboratories were certified for tropical use. Specially constructed, solid fibreboard and wood cases were used for protection during shipment. Joint investigation of lacquers, paints and waxes which could be applied after the canning operation was undertaken by can manufacturers

and the canning industry, and several of the coating materials proved efficacious in protecting the metal containers from corrosion. Protection of the cans in this manner was known as procoating; most of the canned foods for overseas use were procoated from early in 1943 to the end of the war.

Joint procurement and research facilities were established to utilize canning facilities to the fullest extent. While many canned food items, such as fruits and vegetables, were standardized and readily assimilated into the ration picture, it was necessary to develop many new items and adapt them to quantity production in the face of labour and equipment shortages. Canned meat products especially were limited in variety, and their number was increased from 9 to more than 50 during the war years. Through the complete co-operation of the canning industry it was possible to supply U.S. forces with an adequate, varied and nutritionally balanced diet.

Legislation.—Enactment of the (U.S.) Food, Drug and Cosmetic Act of 1938 was of particular interest to the canning industry, since the new law provided for adoption of minimum standards of quality for all foods analogous to those for canned foods under the old 1906 law. The latter had been amended at the request of the canning industry to make possible the promulgation of such minimum standards with the force of law. When a minimum standard of quality for any food had been adopted, any lots which failed to comply were required to be labelled to show that they were of substandard quality. Similar requirements applied to standards of fill-of-container. Such standards were sought for their value in regulating competition between that portion of the supply which was of highest acceptability and that which, although wholesome, was less desirable in respect to flavour, appearance, texture, uniformity, etc. Under the 1938 act standards of identity, quality or fill-of-container were adopted for all of the prin-

Food cannery at the federal penitentiary on McNeil Island, Wash., where prisoners helped to prepare canned goods needed for U. S. domestic consumption and lend-lease during World War II

cipal canned vegetables, the more important of the canned fruits, canned milk and some canned sea foods.

Research of the Industry.—In respect to quality of pack, and particularly to methods of ascertaining and designating quality factors, the industry exerted organized effort throughout the decade 1937–46. Instruments and tests for determining the suitability of raw materials were developed and gained wide use. One example of this was the tenderometer, a testing machine designed for determining the tenderness, and indirectly the maturity, of fresh peas for canning. Another instance was the test for percentage of alcohol in soluble solids, developed as a measure of maturity for canned peas and incorporated in the standard of quality for that product. Such tests found application in determining suitable forms of labelling to reflect quality attributes of canned foods.

There was a continued trend toward use of more informative types of labelling. This took two forms, the use of descriptive terms to indicate separate attributes, and employment of grade designations based on a weighted scoring system as a collective index of quality. Both systems had proponents, and in some instances both were used together.

Although considerable research on the nutritive values of canned foods had been accomplished prior to 1937, such work was given a fresh impetus by the results of research on the identity and evaluation of nutritional factors. The chemical nature of several of the vitamins had been disclosed, as well as the plural nature of some previously thought to be individuals. In addition, improved methods of assay were becoming available so that it was possible to express in numerical terms vitamin potencies which had previously been measured only in a qualitative or semiquantitative way. As a result, investigation of the nutritive qualities of all foods, including canned, was greatly facilitated. The largest single investigation of this sort was that launched in the U.S. in 1941, and continued in subsequent years, under the joint sponsorship of the canning and can manufacturing industries. Work under this project was divided among several prominent universities. The results received early application as a basis for design of rations for the armed forces, in addition to their function in determining the contribution of canned foods to the general dietary.

The Problem of Tin.—While the use of glass containers increased steadily, the canning industry continued to depend mainly on metal containers. As a result, canning was a large factor in the demand for tin. Of the U.S. consumption of tin, amounting to roughly 70,000 to 100,000 long tons during the years 1937-41, approximately half was accounted for by tinplate. With the advent of war in the Pacific in 1941, supplies of tin from the far east, which had been the principal source, were cut off by Japanese occupation. The greater part of the world tin supply had originated in the Malay states, Straits Settlements, the Netherlands East Indies and adjacent areas, the sources next in order of importance being Bolivia and the Belgian Congo. For the duration of World War II, no information was available as to the amount of tin mined in the areas under Japanese occupation, or the fate of the workings. It was later found that very little was produced in those areas and that mining equipment had deteriorated to such a point that several years would be required to restore production to a prewar level. Some alleviation of the shortage of tin resulted from increase in the production of Bolivian ore and construction of a new plant in

Texas for smelting and refining it.

Existing stocks and new supplies of tin were put under strict government allocation and a program of conservation was put into effect. In the U.S. and Canadian canning industries, this took several forms: (1) use of substitute containers utilizing less tin than theretofore; (2) reduction or elimination of the tin content of solders; (3) imposing quotas on production of some canned food items; and (4) prohibiting the canning of some foods, particularly those for which canning was not an essential means of preservation. The most far-reaching technological changes were those resulting from introduction of substitute containers, which were fabricated from types of plate previously produced in small volume or not at all. For some products, it was found possible to use hot-dipped tinplate of lower tin content than that used for many years, electrolytically-coated tinplate bearing only one-third the weight of tin of conventional hot-dipped, and even lacquered, chemically treated steel sheet bearing no tin at all. The facilities for production of electrolytic plate were greatly expanded, and there were indications that much of the increase in use of this type of plate would be perma-

Among other technical developments was a process devised in 1940 in Great Britain for rendering tinplate more resistant to chemical attack. It consisted of treatment of the tinplate in an alkaline oxidizing bath and had two results promising practical benefit. One was reduction or elimination of interior staining of cans by sulphur-bearing foods such as meat; the other was increased resistance of cans to external atmospheric corrosion.

Capetown

Plans for doubling the area of Capetown, legislative capital of the Union of South Africa, were announced on Aug. 13, 1937. The scheme provided for reclamation from the sea and the laying out of an area of land equal to the existing metropolitan area; it included the entire rebuilding of the foreshore and the erection of a large modern railway station and a new city hall. The carrying out of the scheme was to last ten years, but work was held up at the outbreak of World, War II. The building of the

Graving dock completed at Capetown, South Africa, in 1945

giant Sturrock dock, however, began in April 1942 and was completed in 1945; it had a clear entrance width of about 148 ft. and an available length of 1,212 ft. The new harbour of 290 ac. was named "Duncan dock" in April 1943 in honour of the governor general, Sir Patrick Duncan. New plans for the rebuilding of the city itself were accepted in 1946 by the joint committee representative of all the interested bodies, providing for the retention of the historic Adderley street, the grand parade, the Michaelis gallery, the public gardens, the Malay quarter and the castle. It was announced on March 30, 1946, that the royal family would visit South Africa in the early months of 1947. At the end of the year Capetown began its preparations for a ceremonial welcome, which took place in Feb. 1947.

A population census taken in 1946 showed that 454.052 people were living in the city, a large increase over the 1936 census figure of 344,223.

Carbon Black

Three related factors combined during the years of World War II to affect the carbon black industry: first, 90% or more of the output of carbon black was used in the compounding of rubber; second, with the United States cut off from most of its normal sources of supply of natural rubber, it was necessary to substitute synthetic rubber; and third, the compounding of synthetic rubber required about twice as much carbon black as did the natural rubber formerly used. The combined effect of these factors can be followed in the accompanying table.

Data on the Carbon Black Industry in the U.S., 1937-45

	193 <i>7</i>	1939	1941	1943	1945
Production	255,303	262,583	297.033	296,711	526,399
Year-end stocks	50,249	65,396	59,429	102,108	51,003
Total sales	244,808	280,267	322,372	314,650	510,018
Export sales	92,127	101,914	74,083	52,456	86,887
Domestic sales	152,681	178,353	248,290	262,194	423,131
Rubber	134,792	158,311	219,751	236,737	402,193
lnk	9,058	10,965	19,099	11,765	11,412
Paint	3,080	3,191	2,920	1,972	3,711
Other uses	5,701	5,886	11,520	11,720	5,816
Natural gas used*	341,085	3 <i>47,</i> 270	365,3 <i>77</i>	315,562	431,380
Average yield †	1.50	1.51	1.63	1.88	2.32
Average value‡	3.41	2.45	3.26	3.41	4.02

*Millions of cubic feet.
†Pounds per thousand cubic feet.

Because of the fime required to build up the output of synthetic rubber, most of the increased demand for carbon black was concentrated in 1944 and 1945, and in spite of increased plant capacity, demand outstripped supply; even when the end of hostilities brought reduced military requirements, civilian needs absorbed the surplus.

In 1937 there were 24 operators with 57 plants and a

capacity of 316,832 tons; in 1945 the 22 producers and 59 plants had a capacity of 663,132 tons, indicating an increase of 104% in average plant capacity.

The postwar prospects for the carbon black industry were largely dependent not only on the rate at which natural rubber could be made available, but also on the extent to which it was deemed advisable to keep the warborn synthetic rubber industry in active operation as a safeguard against possible future interruptions in the supply of natural rubber. Since natural rubber required only about half as much carbon black as synthetic rubber, a return to natural rubber would be a severe blow to the carbon black industry; on the other hand, the failure to provide a market for at least a reasonable amount of natural rubber would have even more severe repercussions on the whole economic life of such areas as Malaya and the Netherlands Indies. (See also Rubber.)

Cárdenas, Lázaro

Cárdenas (1895—), Mexican statesman and army officer, was born May 21, 1895, at Jiquilpin de Juarez, Michoacán, Mexico. Forced to leave school at the age of 11 to help the family finances, he worked in a small printing shop. When he was 18, he joined Francisco I. Madero's revolutionary army, advancing rapidly through the grades to general of a division. Supported by the Mexican labour unions, he was elected governor of the state of Michoacán in 1928. He became leader of the National Revolutionary party in 1930 and the following year President Plutarco E. Calles appointed him minister of war.

Cárdenas was elected president of Mexico in 1934, largely because of Calles' support, but soon after his inauguration on Dec. 1, he exiled his former political mentor. In 1938, Cárdenas expropriated oil lands belonging to foreign companies, principally U.S. and British. As a result of the seizure of the British-owned oil fields there, Mexico severed relations with Great Britain on May 13, 1938. The Cárdenas administration also exchanged several sharp notes with the U.S. government before the president finally agreed to submit the matter to a joint-claims commission.

In July 1940, Cárdenas selected Gen. Manuel Avila Camacho as his successor; Avila Camacho won the presidential elections by an overwhelming majority. On Dec. 10, 1941, three days after the Japanese attack on Pearl Harbor, Avila Camacho appointed Gen. Cárdenas commander of all land, sea and air forces on the Pacific coast. He was made minister of national defense (1943–45) and was appointed commander-in-chief of the Mexican army in 1945. He retired Sept. 2, 1945.

Cardozo, Benjamin Nathan

Cardozo (1870–1938), U.S. jurist, was born in New York city, of Jewish parentage, on May 24, 1870. Educated at Columbia university, he was admitted to the New York bar in 1891, and immediately set up practice in New York city. In 1914 he was elected to the supreme court of New York state, later joining its court of appeals. In 1932 he was appointed to the U.S. supreme court by President Herbert Hoover. Cardozo was interested not so much in the precedents and rules of law as in its philosophy and the reasons for its application. Liberal in outlook, he became known to the entire U.S. in the earlier part of Franklin D. Roosevelt's presidency, when measure after

measure involving the New Deal was challenged for constitutionality before the court. Cardozo invariably took the side of the administration, and the judgments pronounced in favour of the New Deal were usually written by him. Justice Cardozo died July 9, 1938, at Port Chester, N.Y.

Carlson, Evans Fordyce

Carlson (1896-), U.S. marine corps officer, was born Feb. 26, 1896, at Sidney, N.Y. After attending high school for a brief period, he enlisted in the army when he was 16, and was honourably discharged in 1915 as a top sergeant. Recalled to service at the time of the Mexican border troubles, he later went overseas to France during World War I. Carlson, who was mustered out in 1919 with the rank of captain, had received French and Italian decorations and a citation from General John J. Pershing. Chafed by civilian life, he enlisted in the marines in 1922 as a private. Commissioned a second lieutenant in 1923, he served in Central America and the orient. In 1937, he made a 2,000-mi. trip into China, observed battles between Chinese Communist guerrillas and the Japanese and praised the tactics and fighting ability of the guerrillas. Carlson subsequently resigned and revisited China in 1940 and 1941 as a civilian. Back in the U.S., he rejoined the marines and in May 1941 he was returned to active duty as a major.

In 1942, he was given command of a marine corps raiding unit, later known as "Carlson's raiders." Thoroughly schooled in guerrilla tactics, he and his raiders staged a successful raid, Aug. 1942, on Japanese-held Makin Island and later participated in the fighting on Guadalcanal and the invasion of the Gilbert Islands, Nov. 20–23, 1943. Wounded in the battle for Saipan, he was promoted to the rank of colonel in Nov. 1944. He retired from the marines, July 1, 1946, with the rank of a brigadier general.

Carol II

King Carol II of Rumania (1893—), eldest son of King Ferdinand and Queen Marie, became crown prince on the death of his grandfather Carol I in 1914. Carol married outside of the royal line, but the union was dissolved and in 1921, he wed the Princess Helen, daughter of Constantine, king of Greece. They had one son, Prince Mihai, born Oct. 25, 1921.

In 1925, Crown Prince Carol fled with a commoner, Mme. Magda Lupescu, and renounced his rights of succession to the throne. On the death of King Ferdinand in 1927, the crown prince, Mihai, was enthroned as king under a regency. The following year, the marriage of Carol and the Princess Helen was dissolved. Carol and Mme. Lupescu resided in England and France until 1930, when he returned to Rumania. The regency council resigned, Mihai again became crown prince and Carol became king, June 9, 1930.

In the succeeding years Carol ruled with powers amounting to a virtual dictatorship, although he permitted continuance of parliamentary forms of government. In 1938, after the rise of the fascist Iron Guard threatened the throne itself, Carol proclaimed martial law and censor-

ship. He culminated these absolutist actions with his royal decree of Dec. 16, 1938, announcing establishment of a single legal political party, "The National Renaissance

A year after the outbreak of World War II, in a lastditch effort to save his tottering regime, he appointed Ion Antonescu as premier on Sept. 5, 1940, conferring dictatorial powers on the general. But Antonescu forced Carol's abdication, Sept. 8, in favour of Mihai. With Mme. Lupescu, Carol went to Spain, where he remained under guard until March 3, 1941, when he and Lupescu escaped into Portugal.

They then took up residence in Mexico City. In 1943, Carol tried to regain favour with the Allies and hired a U.S. publicity agent to help him gain this end. After failure of this venture, Carol and Lupescu were cast back into political obscurity.

Caroline Islands

The Caroline Islands, mandated to Japan by the League of Nations and fortified in comparative secrecy after Japan left the league, formed the longest link in a chain of atolls and small islands from the "Land of the Rising Sun" southeastward toward the shipping lanes between the United States and Australia. Together with the Marshall and Gilbert Islands, these "anchored aircraft carriers" provided numerous bases for Japanese air, surface and submarine operations against Allied shipping during World War II.

Japan's two strongest bases in the mid-Pacific were in the Palau group, in the western Carolines and in the Truk group, in the eastern section of the archipelago. U.S. amphibious forces landed on Peleliu in the Palaus Sept. 14, 1944 and secured a 4,000-ft. air strip in two days of fierce fighting. They made immediate use of the base to keep other islands of the group neutralized, clearing the way for shipping in support of operations against the Philippines. Ulithi, in the northwestern Carolines, was taken without resistance Sept. 20 and its ample anchorage, protected against submarines, was put to use as a staging and repair centre for the U.S. navy.

Few other islands in the Caroline archipelago were taken by the Allies, who chose to keep Japanese bases in the group neutralized by bombing, strafing and shelling. Truk, Yap and other garrisons not captured, surrendered to the Allies after the war came to an end.

Like the Marshalls, the Carolines were of little value and interest to the nations of the world until the 1930s, when the threat of World War II gave them military significance. They were almost entirely closed to all but Japanese and their own natives after Japan began fortifying them. Missionaries, some of them from the United States, were permitted to remain into the late 1930s, however, and in fact some remained throughout the war. Apparently all who had important knowledge of the fortifying of any of these islands were forcibly detained.

As Japan encouraged emigration of Okinawans and Japanese to the islands, the native population decreased. During the generation ending about the time of the outbreak of World War II the native population, which had remained at about 50,000 for a century, had dropped to an estimated 40,000. The population of Yap, for example, dropped from 13,000 in early Spanish times to about 4,000 in 1939. Disease, limited diet, sex perversion and witchdoctor care of the sick, as well as unhealthful livingquarters, were reportedly the principal causes of the decline.

Japan instituted a medical program for all the Carolines, especially against communicable diseases, and provided some elementary schooling.

Commerce between the islands was of little volume and value. Agricultural possibilities were severely limited by the nature and size of the islands and by ignorance of crops and methods. However, the Japanese had established small dairies on Yap, Truk, Ponape and Palau before the war and had given agricultural instruction and aid to natives, on a very limited scale. Plagues made frequent inroads on poultry, making poultry breeding a costly business.

When the islands were taken over by the United States, a senior naval officer was designated as head of the island government. To his administrative staff were appointed specially trained persons whose aims were the restoration of war-damaged property, improvement in health and sanitation of the native populations, early establishment of self-governing communities, establishment of an educational program adapted to their needs and capabilities and improvement of agriculture and island industry, including handicrafts. However, a considerable percentage of the most able islanders were also employed by U.S. forces by early 1946.

Carpatho-Ukraine

Carpatho-Ukraine, or Ruthenia, before 1918 formed part of Hungary. After World War I it was assigned as an autonomous unit to Czechoslovakia. On June 29, 1945, Carpatho-Ukraine became part of the soviet union. Area: 4,871 sq.mi.; pop. (1930): 725,357, of whom 450,925 were Ukranians (Ruthenians) and 109,472 were Magyars. According to religion, 359,167 were Greek Catholics, 112,034 Greek Orthodox, 102,542 Jewish.

Carpatho-Ukraine was the most backward and probably the poorest part of Hungary when it joined Czechoslovakia in 1918. Under the new administration, standards of living and education were efficiently raised and full democratic liberties established. At the parliamentary elections in 1935 the Communist party received the largest percentage of votes polled, 25.6%. In the first partition of Czechoslovakia, following the Munich agreement in the fall of 1938, the southern parts of Carpatho-Ukraine with a predominantly Magyar population were ceded to Hungary. The remaining territory received a far-reaching autonomy in the new or second Czecho-Slovak republic. Under the leadership of the prime minister, Mgr. A. Volozhin, Carpatho-Ukraine regarded itself as a centre for the development of a united free Ukrainian nation. The Ukrainian Nationalist party (UNO) and the national militia (Sich) worked for the idea of the liberation of the Ukrainians from Russian and Polish domination.

At the time of the second partition of Czechoslovakia in March 1939, Hungarian troops occupied Carpatho-Ukraine after a short-lived attempt of the local Ukrainians to proclaim their independence. The Carpatho-Ukraine was incorporated into Hungary, and on June 23, 1939, received a limited autonomy; its name was changed to

Carpathia with its capital in Ungvár (Užhorod).

With the restoration of Czechoslovakia through the victory of the United Nations in 1945, the territory returned to Czechoslovakia. But by an agreement between the soviet union and Czechoslovakia on June 29, 1945, Carpatho-Ukraine was ceded to the soviet union and became a part of the Ukrainian Soviet Socialist republic. Under soviet influence the Greek-Catholic Ukrainians were reported to be abandoning their faith and joining the Greek Orthodox Church.

Carrel, Alexis

Carrel (1873-1944), French surgeon and biologist, was born June 28, 1873, at Ste. Foy-les-Lyon, France. A Nobel prize winner and world-famous scientist, Dr. Carrel was a member of the staff of the Rockefeller Institute for Medical Research, New York city, until 1939, when he retired as member emeritus. In May 1940 he returned to France, and a month later was appointed director of the Foundation for the Study of Human Relations. On Dec. 3, 1941, the Vichy government said his foundation would study "the reconstruction of man from the physical as well as the mental viewpoint." He was dismissed from this post after the liberation of France and was charged with collaboration with the Germans; Carrel denied the accusations. In late Oct. 1944 reports that he would be brought to trial were denied by the De Gaulle government. Carrel died in Paris, Nov. 5, 1944.

Cartography

World War II interrupted most of the continuing survey activities in cartography. On the other hand, it created unprecedented cartographic activity which, in turn, advanced the mapping of the earth's surface and the techniques utilized therefore far beyond what would otherwise have occurred. For example, during the war a geodetic control grid adequate for basic mapping was established throughout most of the world. This involved the precise location of points-50 to 100 mi. apart, an undertaking which otherwise probably would not have been accomplished for decades. Again, in 1941, less than one-fifth of the world was covered with source maps adequate for aeronautical charting at 1:1,000,000, whereas by 1946 such charts existed for most of the sphere, at least in first edition sheets.

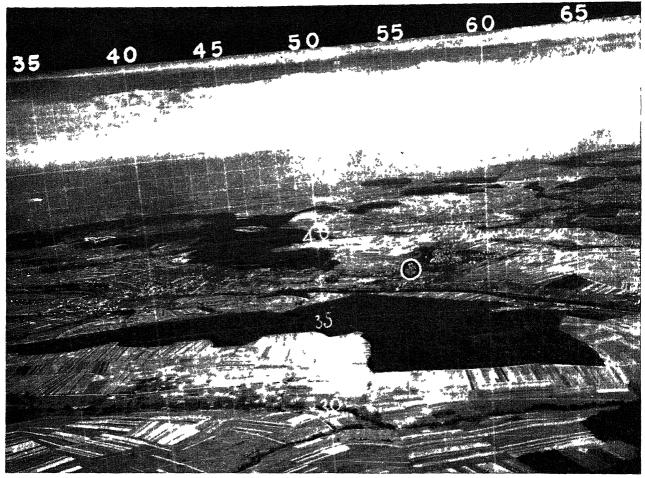

The U.S. had long lagged behind other great powers in both governmental and popular appreciation of cartography. Interest in the subject increased steadily after World War I and especially in the later '30s, as was evidenced by the appearance of the first adequate U.S. textbook, General Cartography (1938) by E. Raisz, together with Cartography by C. H. Deetz (1936), and the publication of a U.S. edition of Map Making by F. Debenham (1936). With the coming of World War II, interest grew at a tremendous rate, and after 1940 several dozen popular and professional volumes were published. World War II truly brought cartography and maps to the attention of the U.S. Probably 750,000,000 maps and charts were produced by the mapping agencies of the U.S. government alone during the war. For the first time, scores of new maps were published daily and weekly by newspapers and

Slotted templates, serving as a base for a map compilation from aerial photographs, being assembled by girl operators. Each strip represents the flight line of a plane; the intersections of the template arms locate the prominent features that serve as landmarks

other periodicals. An unprecedented demand for cartographers and draftsmen caused the establishment of instructional programs in many colleges and training centres. The great increase in personnel, together with the vast new requirements for maps, produced a rapid advance in mapping and representational techniques. Apparently the only cartographic casualty of the war was the familiar road map, but after V-J day it recovered completely its prewar annual publication figure of around 150,000,000 copies.

New Techniques.—Several revolutionary and many less spectacular advances were made during the decade 1987-46 in the techniques of cartography. Probably the most far-reaching were those connected with the science of photogrammetry-mapping from photographs. In 1936 the "Multiplex Aero-projector" had been introduced experimentally by the U.S. geological survey. This mechanism afforded precise mechanical rectification of overlapping air photographs on previously established planimetric control. This technique, although not applicable for hypsometric control in all types of terrain, was of course much faster than ground survey and cut by at least two-thirds the cost of producing accurate large-scale topographic maps. Equally important in the production of smaller scale coverage was the "Trimetrogon" method of aerial surveying developed by the Aeronautical Chart service in co-operation with the geological survey. Synchronized cameras, one vertical and two oblique, were

Pictorial map formed by superimposing a grid on a U.S.A.A.F. photo of axis terrain—one of many used in the Allied offensive across the Saar early in 1945. Such obliques were keyed to army maps; axis activities observed by artillery lookouts (circle) were plotted and reported to fire direction centres, where the information was used to give batteries range and direction

used to photograph strips from 15 to 25 mi. wide from altitudes of 20,000 to 40,000 ft. at a cost of about \$.25 per sq.mi. The speed with which mapping could be accomplished by this process was indicated by the record of a unit of 200 persons in the geological survey. In a sixmonths' period during the war, this unit produced aerial navigation charts covering 2,000,000 sq.mi.

During the decade, two long-established conventional procedures were generally superseded by other methods. Until about 1938 almost all precise maps and charts had been engraved on copper plates. After that time, many refinements of the cartographic-lithographic processes eliminated the need for copper plates and contributed greatly to the flexibility and productivity of the field. The decade also saw, in the U.S. at least, the replacement of hand lettering by mechanically produced lettering (and symbols) for application to the drawing surface. Lettering, known as "stick-up," could be produced by photographic or printing techniques and allowed for better design and standardization.

The refinement of the lithographic processes with respect to cartography was accompanied by an increased interest in the representation of terrain. Both the geological survey and the Aeronautical Chart service carried on investigations in the introduction of the shaded relief map utilizing aerial photographs as source material.

Wider use of this technique gave promise of permitting easier recognition of surface features from aircraft and of increasing popular appreciation of the topographic map. Several attempts were made in the U.S. and Germany be fore and during World War II to produce precise shaded relief by half-tone photography from models, but success was limited.

Techniques of model making and reproduction also made great strides after 1936. Accurate models were produced and reproduced in rubber, steel, aluminum, vinylite and other plastics. A device for the projection of contours in three dimensions so that a model could be carved to the apparent surface so created was developed during World War II. Also invented was a mechanism which allowed orthographic projection of planmetric data on a three-dimensional surface and thus increased the accuracy of the finished product. Increased use of radar navigation seemed likely to further the demand for precise terrain representation by actual relief models as well as shaded relief maps.

With development of better and cheaper half-tone and colour lithographic processes, the airbrush became standard equipment in the modern drafting room. The general quality of maps, especially those in the smaller scales, immeasurably improved with the greater opportunity for the employment of gray and colour values.

Techniques for the representation of geographical relationships were widened, partly because of the war and partly because of the entrance of commercial artists into cartography. Perhaps the most notable advance was the attempt to popularize the so-called "global" relationships through the use of the more visual map projections such as orthographic, azimuthal equidistant and others (mostly azimuthal), many of which were employed in the polar phase. This was accompanied by a visual revolt against the "evil" Mercator and some of the time-honoured projections in scientific cartography. The movement was exemplified by the titles of two published atlases: Look at the World, by Richard Edes Harrison and Atlas of Global Geography by E. Raisz.

Increased emphasis on the "global" aspects of the world community brought forth many publications concerning the appreciation of cartography as a medium to help its understanding, as well as some interesting devices to aid in their interpretation. Among the more notable of these were the transparent plastic hemispheres (showing air line distances, etc.) devised by S. W. Boggs of the department of state for use on globes, the "Likaglobe" of Irving Fisher and the less important but widely publicized "Dymaxion" globe of R. Buckminster Fuller. The last two were world maps projected on the flat faces of an icosahedron and a polyhedron respectively, and could be joined in the forms of these solid bodies to simulate the globe surface. In the field of flat map projections and their construction there were several innovations and advances, among which were the "Bi-Polar Conic Conformal" and the "Miller Cylindrical" by O. M. Miller, "The Nomograph as an Instrument in Map Making" by R. E. Harrison, an equal-area projection of the hemispheres by O. S. Adams and many others of less significance.

New Types of Maps.—Several new kinds of maps and map uses were developed during the decade. Perhaps the most important was the result of the vast amphibious operations of World War II. The data on the normal prewar hydrographic chart and topographic map ceased at the shoreline, with the result that there were few maps, outside coastal areas of the U.S., which showed both land and water data. This deficiency resulted in the U.S. army and navy co-operating in the development of the so-called "map-chart," which appeared likely to become a standard military type of map. Technically interesting were "Lastex" and cloth maps produced in quantity for survival purposes, fluorescent maps and charts for "dark" navigation, and radar and Loran charts for use with new navigational devices. In the field of geographical cartography, mention should be made of the movement toward "Landscape," "Land-Use" and "Land-Type maps" as exemplified by the work of E. Raisz.

During the first part of the decade most of the mapping activities of Europe were concerned with the expansion of detailed and special coverages since most of Europe had been surveyed for many years, although not on consistent geodetic control. The "Land Utilization Survey" of Great Britain had been completed, although not all sheets were published prior to the war. As soon as the war began, all resources of the countries involved were dedicated to military purposes, and a vast amount of compilation (as distinguished from surveying) was car-1ied on, especially by the British through the Geographical Section general staff and co-ordinated survey departments in the colonies and dominions. Through the cooperation of the military mapping agencies of Britain and the U.S., who apportioned the world for greater coordination, maps were quickly compiled and reproduced for large areas in the middle east, far east and Africa.

Cartography in Germany was early brought under the centralizing influence of the national-socialist state, and by the beginning of the decade mapping in the reich was notably more co-ordinated than in any other country.

During the war German cartographers worked out an "amphibious" map similar to the map-chart of the U.S. Much coverage was accomplished along the coasts of France, Italy, Dalmatia, Greece, Norway, Denmark and the coasts of the North and Baltic seas. In addition, a significant amount of survey work was done in the Libyan desert. The Kartographie of Prof. Max Eckert-Greifendorff, Germany's great authority on the subject, appeared in 1939 shortly after his death; the volume dealt with the relation of cartography to modern culture. Little was known of mapping in the U.S.S.R. except that cartography made tremendous strides and extensive areas were being surveyed. Compilation and survey coverages of China, Iran and other parts of the middle and far east were greatly accelerated by the war, but much of the work was of the second order of reliability because of the lack of precise geodetic control. Among several important atlases published in the early part of the decade, were Atlas van Tropisch Nederland (1938), and volumes I and II of the Great Soviet World Atlas (1938).

Mapping and Charting.—The detailed mapping of the western hemisphere proceeded at a relatively slow rate except for limited areas of strategic importance. An important achievement was the completion, during the war, of the American Geographical society's Map of Hispanic America at a scale of 1:1,000,000. The Giant Relief Model of the United States (1:250,000) at the Babson institute was also completed during the decade.

During the decade the U.S. geological survey of the department of the interior published almost 2,000 different topographic maps. These maps, based on control established by the coast and geodetic survey, became the standard detail maps of the U.S. Somewhat more than 10% of the area of Florida, Illinois, Indiana, Louisiana, Maine, Missouri and Nevada was mapped; the mapping of Hawaii and Puerto Rico was completed, and coverage in Alaska was extended.

During the war experts and technicians of the geological survey were actively engaged in compilation and survey work in co-operation with the armed forces. New terrain data for more than 7,500,000 sq.mi. of the earth's land area was made available, primarily for aeronautical pilotage charts.

Prior to the outbreak of World War II, the coast and geodetic survey (q.v.) of the department of commerce continued to extend the triangulation and levelling control of the U.S. and its possessions. Approximately 500,000 sq.mi. were brought under 1st and 2nd order triangulation during the decade, and some 75,000 mi. of 1st and and order levelling was accomplished. In addition to the extension of the geodetic control the survey's normal hydrographic and topographic survey activities added more than 300,000 sq.mi. of hydrographic charting and more than 20,000 sq.mi. of coastal topography to the map resources of the nation. The latter figure included approximately 30,000 mi. of shoreline. Much of this work was done photographically. About 10% of the above survey work was carried on in Alaska and in the Aleutian and Philippine Islands. In 1941 the survey, in co-operation with the department of state, initiated a program of co-operation with the other American republics, primarily concerned with magnetic observations, which was designed to lead toward the establishment of consistent geodetic control for the western hemisphere.

Early in the decade the coast and geodetic survey completed the first aeronautical charting of the U.S. and was

engaged in the preparation of revisions and airport plans when the war required extension of compilation work to foreign areas. Several thousand aeronautical charts were issued on relatively short notice. Although the demand for the maps and charts of the coast and geodetic survey steadily increased, the impact of the war could be gauged from the fact that while some 500,000 copies were issued in 1936, the annual demand during the war rose to nearly 15,000,000.

During the first part of the decade the hydrographic office of the U.S. navy was engaged primarily in extending the charting of the Caribbean, the north coast of South America, and the Atlantic and Pacific approaches to the Panama canal. With the acquisition of defense bases prior to U.S. entry into the war, hydrographic surveys were made of many areas in the Atlantic, including parts of Greenland, Labrador, Newfoundland, British West Indian islands and the Galapagos Islands. During the war most of the surveying resources of the hydrographic office were devoted to charting as rapidly as conditions would permit many areas in the southwest Pacific, including the waters of New Caledonia and the Solomons, New Hebrides, Samoan, Fiji, Marshall, Mariana, Ellice, Gilbert, Society and Palau Islands.

Although the technique of deep-sea sonic sounding had been in operation for several years prior to 1937, the data obtained by this method increased tremendously during the following decade and probably more than 200,000 nautical mi. of sounding lines were made. Sufficient depth data became available during the decade for the publication by the hydrographic office of bathymetric charts, showing the configuration of the ocean bottom, covering the South Pacific ocean and the Caribbean. Four years of wartime research produced the interesting *Ice Atlas of the Northern Hemisphere*.

Extensive naval surface and aeronautical operations of the U.S. navy placed an unprecedented demand on the hydrographic office during the war. In the early part of the decade the office had on issue some 2,800 nautical and less than 100 aeronautical charts, the annual distribution of which amounted to less than 1,750,000 copies. In 1945, approximately 5,200 nautical and 450 aeronautical charts were on issue; in the peak year of activity during the war more than 40,000,000 copies were printed.

The U.S. army was faced with a similar problem of providing hitherto unheard of numbers of aeronautical charts. In 1941, the Aeronautical Chart service was organized within the army air forces and by leaning heavily on the compilation resources of the geological survey and the coast and geodetic survey was able to accomplish a phenomenal record in mapping. By the end of the war it had published thousands of charts in several important series, probably the most significant of which was the socalled "Pilotage Charts," a relatively consistent coverage of the world at a scale of 1:1,000,000. This monumental task could not have been accomplished except for the great strides which had been made in the science of mapping from photography. By trimetrogon mapping alone some 15,000,000 sq.mi. of the earth's surface (approximately five times the area of the U.S.) were mapped in South, Central and North America, Europe, middle east and far east.

Prior to the formation of its map service in the corps of engineers, the U.S. army had operated a small mapmaking establishment almost entirely occupied with strategic areas of the U.S. and its possessions. Most of the

resources of the new organization were employed in the compilation of new maps of the far east, and in the revision and reproduction of existing topographic maps. Nearly 350,000 sq.mi. of new or improved mapping was accomplished, including some 200,000 sq.mi. in China, Japan and the Pacific islands. The production problems were staggering. Some 41,000 different topographic maps, city plans, target charts, etc. were compiled, revised or simply reproduced in four years. Much of the lithographic work for the Aeronautical Chart service and other mapping units both in the U.S. and elsewhere was accomplished by or through the army map service. Almost 500,-000,000 copies were produced and shipped. This total did not include the many thousands of maps compiled, drawn and lithographed in the many field establishments of the corps of engineers.

* * *

SMALL-SCALE cartography increased in importance, particularly in the U.S., during the decade. Although the war provided the greatest stimulus, the increasing concern with this branch of cartography was evidenced by the work of R. E. Harrison, E. Raisz and others early in the decade. During the war many thousands of "specialty" maps (maps depicting a limited number of earth phenomena) were issued by various government agencies such as the Office of Strategic Services, the department of state and the Board of Economic Warfare, and the techniques for their preparation were considerably advanced. Associated with this movement was the publication of many new atlases. Most of those published in the U.S. were for popular consumption, such as Encyclopædia Britannica World Atlas (1942), Look at the World: the Fortune Atlas for World Strategy by R. E. Harrison and Fortune (1944), Global War, an Atlas of World Strategy by E. A. Mowrer and M. Rajchman (1942), and Atlas of Global Geography by E. Raisz (1944).

A significant cartographic development during the decade was the organization in 1941 of the American Congress on Surveying and Mapping and the initiation at that time of the *Bulletin* of the congress, published as a quarterly journal. (See also Geography; Geology; Photography.)

(A. H. R.)

Cartoons

"Cartoonist" had become a broad term by 1946, covering as wide and varied a field as the title doctor, which might mean anything from a brain surgeon to a chiropodist. Like the medical profession, cartooning, too, had become highly specialized. Not so long ago, a cartoonist was one who expressed editorial opinion in pictures. Those primarily engaged in entertainment were known as comic artists.

There was still the editorial, or political, cartoonist of the Thomas Nast and Sir John Tenniel tradition, and it is that specialty which will be considered here except for a few borderline cases which also will be noted.

During the decade 1937-46, cartoonists everywhere had only one basic subject, war. Beginning with the "little world war" in Spain and Japan's "undeclared war" in China the decade was one of continuous explosions or the ghastly silences of the war of nerves. Local issues, even larger national issues, such as the so-called supreme court packing plan and the third term issue in U.S. presidential elections, were secondary. Armed with rapier, bludgeon, block-busters and laughing-gas, cartoonists entered the fray.

In Germany the daily cartoon, as used in the U.S. and England, was unknown. Cartoons before World War II

Above: Drawing of Spanish civil guardsmen, by Luis Quintanilla who was active in the civil war in Spain and who spent four months at the various fronts drawing firsthand impressions of total war

Below: "The Vichy Government in its New Residence," by the Russian cartoonist, Efimov, which appeared in *Krasnaya Zvezda* after a 1944 report that Pétain and Laval had been abducted to Germany and were forbidden to meet. They are pictured writing their respective memoirs

Above: "We Both Officially Deny this is Happening," one of David Low's satires on the nazi capacity for official self-delusion. This cartoon appeared in the London Evening Standard during 1941 and was later reprinted in Years of Wrath, a collection of Low's drawings

Below: Humour based on self-criticism distinguished this French cartoon by Chancel, printed in Carrefour in 1946. The dialogue which accompanied it read: "First we must produce." "Produce what?" "Deputies"

were largely confined to weekly publications such as Simplicissimus of Munich and Kladderadatsch of Berlin. Under Josef Goebbels, cartooning seems not to have thrived in nazi Germany.

In the soviet union, cartoonists and graphic artists contributed their special skills toward crushing the invader. With Hitler's armies virtually at the gates of Moscow, and Leningrad in a state of siege, the Russians carried on in the cartoon field. Skilled professionals were recognized by the authorities as important factors in war and their talents were integrated into the general war effort.

The cartoons signed Kukryniksy in Pravda were of unusual interest not only because of their high quality, but also because they were the joint product of three artists working together. Mikhail Kupriianov, Porfiril Krilov and Nikolai Sokolov were probably considered an unholy trinity by Goebbels and company. Their pen name was a combination of the first syllables of the three artists' names. All three worked on the same drawing, made alterations, and, judging by results, this unusual arrangement worked successfully. Their work was not confined to newspaper cartoons. They also drew a large number of striking and effective war posters in colour.

Boris Efimov, another great Russian cartoonist, was only one person. An expert in caricature, he portrayed Hitler as a gorilla, a ridiculous gorilla, not really human, yet lacking the animal dignity of a real gorilla.

English cartooning, under the outstanding leadership of David Low, carried on almost on a "business as usual" basis during the decade. Low, at the peak of a long career, and with a background of experience and understanding of world events, made a valuable contribution to history in his cartoon record of events. He caricatured the principal leaders of Allied, neutral and axis countries and characterized them in a manner which should

"British Plane," Pulitzer prize cartoon of 1941 by Herblock (Herbert L. Block) of N.E.A. Service, Inc.

clarify for future generations the men and events of World War II.

Despite the bombings which made London and all England practically front-line positions, Low and other English cartoonists were not strafed out of their sense of humour. A good example was a cartoon by Strube of the Daily Express entitled "After the Raid." It showed a typical English housewife peeking from a backyard airraid shelter. On the top of the shelter is her "common people" husband with his warden's tin hat and gas mask bag. "Is it all right now, Henry?" she asks. "Yes, not even scratched," says he, as he proudly inspects a large watermelon growing on a vine atop the shelter.

R.A.F. planes on night raids dropped a series of unsigned V-for-Victory comic cartoons on occupied Europe. There were no captions or lettering on the drawings so the language problem was automatically solved. One such drawing showed a horrified Hitler at table. His two weiners on the plate formed the V sign. Another showed Hitler discovering the V mark on the ample seat of Goering's pants.

Czechoslovakia produced well-printed colour cartoon posters, notably those by A. F. Peele, in modern poster style, with excellent compositions and a real feeling for caricature. Stephen Roth, another able Czechoslovak cartoonist, contributed work of a high order. His style of outline, solid black and gray, was of the David Low type of drawing.

DeGroene (The Green), Dutch weekly, had to go underground during the occupation. In a book of cartoons by L. J. Jordaan, the trade-mark in poster style showed a green frog diving into the water. Innocent enough to look at after the war, but full of significance in wartime. The Dutch did not need to be told the identity of the green frog or the significance of going under. This was an example of the graphic ingenuity used to carry forbidden thoughts under the very noses of the Germans. Jordaan's cartoons, in the style of old steel engravings, had a hard, tough quality of accuracy and detailed realism.

Arthur Szyk, Polish cartoonist, was purely a war product. A noted miniature painter and illustrator of illuminated books in the old tradition, he brought his copiously detailed style to the field of caricature and ridicule of nazism. Szyk, in a way, seemed almost like a mediaeval knight in full armour riding into modern war, for his style was that of the middle ages. Ancient figures which had been frozen into history, in hand-illuminated volumes, were transformed into nazi monsters. Museum pieces became Buchenwald butchers, with all the feeling a Pole could master, and yet retained the all-over pictorial quality of a Biblical illustration by a monk of the middle ages. When Hitler took over Europe, Szyk transferred his base of operations to the U.S. and continued his cartoon barrage. Collier's published many of his works as covers.

The precious old Chinese art of the scholars gave way to the necessities of war, and occidental cartoons became the models of the younger artists. At first, when the Chinese government followed a policy of appeasement toward Japan, no caricature of the Jap was permitted, and cartoons were, of necessity, subtle insinuations into which meaning had to be read. During that period one typical cartoon, delicate in design and execution, showed a huge snake with its head and forepart through a gate in the Great Wall. Behind the wall the body of the snake stretched its coils over what had been Manchuria. The title was "Coming Down," and wise Chinese did not need to be told the identity of the snake or its travel ambitions. Later, in 1937, when the lid blew off, the Chinese artists

followed occidental cartoons in becoming realistic and less indirect, and their powerful messages reached the great mass of people, as no delicate, scholarly art could have done.

In Spain, Louis Quintanilla, an artist in every sense of the word, carried on in the great Goya tradition. Quintanilla's series of drawings entitled "Franco's Black Spain" were an excellent example of the rather rare combination of art and deep understanding of subject matter. Modern in style, delicate of line, having the aspect of etchings, they formed a savage indictment of the Franco regime, its cruel Moors and ruthless German allies. These drawings were not made for a daily publication as political cartoons usually are. They were the work of an artist, a native of the country, recording his reactions to what he saw, and they might take their place in history as a part of Spain's diary which Goya illustrated in his time.

France, the mother of great artists and great cartoonists, seems to have been blacked out by the nazi-Vichy regime. Its free publications began to reappear in limited form after V-E day with contributions by such political cartoonists as Pol Ferjac, Henri Monier, Grove and others. The work of Roger Chancel in Carrefour, literary and political weekly, suggested that the tradition of Daumier and Forain still lived, and that it would not be long before French cartoons would take their rightful place in the world. One of Chancel's drawings, with a sharp Gaelic touch and a play on Churchill's "Iron Curtain" phrase, showed a huge Uncle Sam surrounding France with a celluloid curtain of "Motion picture monopoly."

In the U.S., as in England, the free tradition of cartooning remained uninterrupted. But full advantage of this freedom was not taken, partly because of war restrictions but largely because wide syndication of cartoons and the development of newspaper chains tended toward broad generalization in controversial matters. Stress was placed upon entertainment rather than upon sharply aimed and pointed comment.

In the late 19th and early 20th centuries, there were giants like Thomas Nast, whose powerful pictorial attacks broke up the Tweed ring in New York. Later there was a school of cartoonists like Robert Minor, Boardman Robinson and Art Young, who passionately attacked social injustice and political corruption. These three and others found an outlet for their opinions and emotions in the old Masses, a publication with a broad left-wing policy of social protest.

In the decade 1937–46 Bill Gropper represented the left wing, but the *New Masses*, where his work appeared, was definitely a Communist party organ and there was no room for the resilience and individualism which cartoonists for the old *Masses* enjoyed. "Ding" Darling for many years represented conservative thought, and cleverly translated his opinion into the homely pictorial idiom of everyday life, particularly rural life.

Men like Joseph Parrish and Carey Orr of the Chicago Tribune reflected the highly individual nationalistic views of Col. Robert McCormick, the Tribune's publisher. The same was true of the cartoonists for William Randolph Hearst, also a highly individual nationalist.

Generally speaking, however, cartooning was linked with the character of daily journalism. U.S. newspapers with a few exceptions lost their individuality; their editorial pages, by and large, lost the sharp tang of the days of Horace Greeley, Henry Watterson and Frank Cobb, and cartooning followed the same trend.

As if to fill a vacuum, personal columns of opinion became more and more popular. Newspapers purchased

Henri Monier (left), Pol Ferjac and Grove, French political cartoonists of Action, La Marseillaise, Franc-Tireur and other periodicals

the writings of Harold Ickes, Dorothy Thompson, Westbrook Pegler, Marquis Childs and others, and gave them the privilege of writing as they pleased.

For some reason newspapers dissociated themselves from opinions expressed in signed columns to a much greater degree than in the publication of opinionated cartoons. It would have been interesting to see what contributions Ickes or Pegler would have made to cartooning had their talents run to caricature.

Just as the war produced the simple writing of an Ernie Pyle, so it also erupted the young artist, Bill Mauldin, a sort of Bruce Bairnsfather of World War II. Mauldin was not, strictly speaking, an editorial cartoonist but he was the pictorial spokesman of the combat enlisted man. His work appeared in the army publication, Stars and Stripes. His lean, bewhiskered and rather grim characters were real fighting troops, and if they had their own ideas about new young 2nd lieutenants, Mauldin insinuated them into his drawings. One such cartoon showed a spick and span youngster with bright new eagles on his shoulders meeting, in the war zone, a tough old enlisted man with beard, war-worn uniform, and something of the old man of the sea about him. The young air force officer said in surprise, "Uncle Willie!"

As Mauldin grew in popularity some of the army brass hats tried unsuccessfully to curb his humour and channel his work along different lines, which was further testimony of his effectiveness.

A renaissance of U.S. cartooning seemingly depended upon a renaissance of U.S. journalism as a whole. Its fortunes, for better or for worse, seemed bound up with the restrictions of institutional opinion. Until publishers felt they could indulge themselves in the luxury of a pictorial jester at court, cartooning in the best sense of the

word had to take its place on the counter among the widgets and gadgets of daily journalism, along with the daily horoscope, advice to the lovelorn and the crossword puzzle.

The days when a Hogarth could draw his pictures, make his plates and prints, and sell them as separate items had been replaced by quantity production. (See also Comic Strips; Humour, War.)

Casey, Richard Gardiner

Casey (1890—), Australian politician, was born Aug. 29, 1890. Educated at Melbourne university and at Trinity college, Cambridge, he served as liaison officer between the Australian government and the British foreign office for seven years. After leaving this post in 1931, he entered Australia's house of representatives. During his nine-year tenure in the house, he also held the posts of federal treasurer, minister in charge of development and minister for supply and development. In 1937, the Commonwealth government sent him to London for the coronation and imperial conference, and in 1939 he again represented his country at the London conference on the conduct of the war.

Casey left the house of representatives in 1940 to become minister to the United States. Prime Minister Winston Churchill recalled him in 1942 and placed him in the United Kingdom war cabinet as minister of state in the middle east. On Dec. 24, 1943, it was announced that he was named governor of Bengal in what appeared to be a government move to alleviate the famine situation in that province. His resignation was announced Nov. 7, 1945.

Catholic Organizations for Youth

In Nov. 1937, the first major step was taken in the development of a national Catholic program for youth. The annual meeting of the Catholic bishops of the United

States approved the development of a National Catholic Youth council. It was recognized at that time that the numerous Catholic youth groups, local, regional and national, required a co-ordinating and federating agency in order to establish some national pattern to meet national problems. The promotion of this National Youth council was placed in the charge of the National Catholic Welfare council, the bishops' official national co-ordinating agency.

In 1938 there was established in the executive department of the National Catholic Welfare conference a bureau whose chief responsibility was to set up the framework and supervise the activities of the National Catholic Youth council. Meetings were held with regional and national leaders in the field of Catholic youth work. The first external activity of the newly created national program was in relationship to the then active American Youth congress. Catholic youth participation in this national federation of youth groups was channelled through the National Catholic Youth council. Moreover, the interests of Catholic youth in relationship to governmental programs such as the Civilian Conservation corps and the National Youth administration were expressed through the newly created council.

In 1940 it was realized that both the National Catholic Youth council and the interests of Catholic organizations generally required an expanded national centre. At their annual meeting in that year, the bishops of the Catholic Church in the U.S. raised the Youth Bureau of the National Catholic Welfare conference to a full department and assigned Bishop John A. Duffy of Buffalo, N.Y., as the chairman of this new department.

Moreover, the scope of the National Catholic Youth council was enlarged. A college and university section was established within which a co-ordinating and federating program for students could be developed. The Newman Club federation, a national grouping of Catholic clubs on state and nonsectarian university and college campuses, was brought within the framework of the new section. The National Federation of Catholic College Students, organized in 1937 and unifying student groups in the 200 Catholic colleges and universities, was likewise accepted as a component part of the college and university section of the National Catholic Youth council.

After 1940 the youth department of the National Catholic Welfare conference continued to serve a threefold responsibility for Catholic youth organizations in the U.S. In the first place, it became a centre of reference and information for programs and activities carried on throughout the U.S. under Catholic auspices. Secondly, it was charged with developing both in the general communities and in college and university life the co-ordinating and unifying program contained in the National Catholic Youth council.

Finally, this department served as the official representative of Catholic youth groups in relation to and co-operation with governmental and nongovernmental youthserving agencies and programs.

Below the national level, a considerable development of regional Catholic youth programs took place in all parts of the U.S. after 1937. In the U.S., there were 121 diocesan divisions in 1946, each under the supervision of a bishop. Prior to 1931 none of these dioceses had an officially organized diocesan youth program. In that year the Most Reverend Bernard J. Sheil, auxiliary bishop of Chicago, established in that city a diocesan Catholic youth organization. In the several succeeding years, other dioceses imitated this pattern. During the decade 1937–46,

youth programs with a central office and professional staff under an officially appointed director were established in the vast majority of dioceses in the U.S. By the fall of 1946, 107 of the 121 dioceses had established diocesan youth-serving and co-ordinating agencies in their areas.

The program of these diocesan agencies or bureaus differed from place to place in scope and in the multiplicity of functions. In the larger centres such as Chicago, Detroit, New York and Boston, an extensive program of youth activities and services was carried out. The staff and budget of these larger agencies were proportionately extensive. In smaller dioceses, particularly in rural areas where needs and circumstances were less considerable, the diocesan program was less extensive in scope and function. However, the common objectives were found in all these diocesan bureaus. Assistants to local units, a provision for volunteer training, unifying and co-ordinating activities beyond the local level, and representation and co-operation with other community groups continued to be the chief features found in diocesan youth programs.

During the decade, local groups felt the impact of these diocesan programs variously known as the C.Y.O., the Diocesan Youth department, the Catholic Youth council office, etc. The standards of activities in local organizations were raised considerably. The wider problems of youth and projects to meet these needs were submitted to sponsors of local parish groups throughout the U.S. Informal educational practices and recreational activities developed by agencies outside the church were brought to the attention of local groups and included in their programs. An outstanding example was the utilization of the scouting program in many Catholic youth groups throughout the country.

In spite of World War II and in some measure because of it, national Catholic youth-serving programs extended their activities. The Sodality of Our Lady, with its national office located at 3742 West Pine Blvd., St. Louis, Mo., increased its local units and general membership. The Junior Catholic Daughters, 39 Manchester Terrace, Mt. Kisco, N.Y., extended its program for girls into 22 states and 3 territories. The Columbian Squires, a youthserving project of the Knights of Columbus, with national offices at 45 Wall St., New Haven, Conn., had shown considerable activity during the late 1930s. With the advent of war, this program for high-school boys was somewhat curtailed because of losses of staff and older boy counsellors. After the conclusion of the war, a broad program of organization and extension was initiated in conjunction with the councils of the K. of C. throughout the country.

Two new organizations of Catholic youth developed in various parts of the country. One program was based upon the excellent experience of Belgian and French leaders in relation to working youth, viz., Jeunesse Ouvrière Catholique (J.O.C.) numbering tens of thousands of young men and women in all parts of Europe. Even the war did not prevent the extension of this movement. In the U.S., certain Catholic leaders felt that this form of youth organization met a distinct need of the times. Groups of young people were organized to apply the J.O.C. method to the U.S. scene. Formed into small groups, they met to study the social, cultural and economic conditions affecting youth in their particular environment. On the basis of these observations, they instituted a systematic program in cooperation with any other group so interested to bring about beneficial changes in the milieu in which they were situated. Basically, this program of the Young Catholic Workers was a Christianization of the environment of young workers. By observing, judging and acting on environmental conditions, they would raise the general level of economic, community and family life. Such groups multiplied during the decade and were to be found from Manchester, N.H., to San Francisco, Calif.

The second of these new developments was the Young Catholic Student movement, working along the same lines as the Young Catholic Workers, but in college and university life. They hoped to bring a more Christian and enlightened attitude to students' environment. Approximately 100 such groups of students were functioning in both Catholic colleges and Newman clubs throughout the country in 1946. A centre for this activity was found at Notre Dame university, Ind., where publications and correspondence were related among the individual units.

Much literature was developed during the decade concerned with various activities of Catholic Youth organizations in the U.S. Both diocesan youth bureaus and national youth-serving organizations contributed to this literature on specific phases of their programs. To meet a growing need both inside and outside the church, one booklet was published which described in summary fashion the organization, membership and program of all recognized national and regional Catholic youth programs in the U.S. The Catholic Youth Directory, edited and published by the youth department of the National Catholic Welfare conference with headquarters at 1312 Massachusetts Ave., N.W., Washington, D.C., included in 1944 an outline of the structure and activities of all Catholic programs beyond the local level.

Catholic Rural Life Conference, National

It was in 1923 that Father Edwin V. O'Hara, later bishop of Kansas City, Mo., and a group of priests interested in problems of the land banded together to form the National Catholic Rural Life conference. The founders had two things in mind: to bring religion in its fullness to rural dwellers and to so improve their socio-economic status that they might obtain at least that amount of material prosperity which helps to the practice of virtue.

Through the years, and especially during the depression of the 1930s, these objectives were further developed and clarified. At the end of the decade 1937-46, the general aims of the conference could be stated thus: (1) To care for underprivileged Catholics living on the land; (2) to keep more Catholics on the land; (3) to settle more Catholics on the land; (4) to convert the non-Catholics on the land. These objectives derived from the realization by members of the conference that agriculture as a way of life had been followed by a disproportionately small number of Catholics. In a reversal of this tendency was seen a means of encouraging family living of a sort calculated to strengthen the family as the basic unit of society. By having Catholics live in reasonably prosperous areas where basic social services and religious facilities were available, both civic and religious life would be strength-

During the decade 1937-46, conference headquarters were in two cities. Until 1940, the Reverend James Byrnes was executive secretary. Because he resided in St. Paul, Minn., the headquarters were located there. After 1940 the office of executive secretary was held by Monsignor Luigi Ligutti, of the Des Moines diocese. In 1941 he

brought the headquarters to Des Moines, Ia., long a centre of agricultural activity and organizations. A permanent headquarters building was established in that city, at 3801 Grand avenue.

During the same period, the official publication of the conference varied. At first it was the Catholic Rural Life Bulletin. At the 1941 convention it was decided to issue a quarterly, to be called Land and Home. The first number appeared in Feb. 1942. In addition to the official magazine, the conference published and distributed a great number of leaflets, pamphlets and folders designed to forward its educational and servicing program. Through a book service, operated at headquarters, books and pamphlets of other publishers were made available to those seeking information on rural problems.

The decade witnessed considerable development in the organization and administration of the conference. Reverend William T. Mulloy (later bishop of Covington, Ky.), president from 1935 to 1937, was again elected to that office at the 1946 convention, after having served as acting president from the spring of 1946 when reasons of health led Bishop William A. Griffin, of Trenton, to resign. Bishop Griffin had served as president from the 1945 convention. Other presidents during the period were: Rt. Rev. Mgr. Luigi G. Ligutti, 1937-39; Rt. Rev. Mgr. Vincent J. Ryan, later bishop of Bismarck, N.D., 1939-41; Most Rev. Aloysius J. Muench, bishop of Fargo, N.D., 1941-43; Most Rev. Joseph H. Schlarmann, bishop of Peoria, Ill. The bishop of Des Moines, Ia., Most Rev. Gerald T. Bergan, served as ecclesiastical moderator of the conference.

Among the publications setting forth the philosophy of the National Catholic Rural Life conference may be mentioned Rural Life Objectives, a series of papers begun by Father James Byrnes when he was executive secretary. In 1939 appeared the Manifesto on Rural Life, a volume correlating statements gleaned from papal encyclicals, pastorals of bishops, and other authoritative sources, in such a way as to make explicit the religious and sociological principles for which the conference stood. In 1940 Monsignor Ligutti, the executive secretary, collaborated with Rev. John C. Rawe, S.J. in the publication of Rural Roads to Security, a study of rural trends and principles governing land use, family living and community activity. The conference also continued to make regular use of the press to spread its ideas. Each week a syndicated column appeared in approximately 70 of the diocesan papers.

The National Catholic Rural Life conference took final juridical form on May 16, 1944, when its constitution and by-laws were adopted by the board of directors of the original corporation, consisting of Bishop Muench, Bishop Bergan and Monsignor Ligutti. The drafting committee of the new constitution had worked under the direction of Bishop Schlarmann, who in 1944 was president of the conference. The legal effect of the new constitution was to make of the whole conference one corporation. Up to the time of its adoption the members had been held together by a more or less informal agreement.

The activities of the conference expanded with the years. By the end of 1946, it had rural-life directors in approximately 70 dioceses of the United States. These priests, appointed by their bishops, assumed the responsibility of promoting the objectives of the conference within their respective dioceses; they formed a committee of their own within the conference, having their own chairman.

The conference also organized, either from headquarters

or through the diocesan directors, rural-life summer schools and institutes in which priests, sisters and lay people met together to discuss mutual problems and participate in discussion groups. These institutes, through their influence upon teachers and parents, did much to give a more rural orientation to Catholic schools located outside cities. They became an integral part of the conference's educational program. During 1945, there were 82 schools and institutes, with a total attendance amounting to 22,000. A somewhat similar educational function was the fostering of study groups in seminaries throughout the country; there were about 35 such groups at the end of 1946, composed of clerical students interested in preparing themselves more effectively for work in rural areas. The conference prepared special study outlines and literature for these students.

One of the conference's functions was to maintain contact with other organizations and agencies concerned with rural problems and agricultural matters. This function was indicated in article II, section 2 of the new constitution: "the conference shall . . . maintain friendly contact with other rural life associations; shall collaborate, wherever feasible, with such and other organizations and with governmental agencies that seek to protect and foster the well-being of the rural population; and shall interest itself in every worthy effort to bring the blessings of wholesome living to our rural population."

In carrying out this function the executive secretary and other conference members discussed rural problems and agricultural policy with governmental and nongovernmental groups, always advocating action which seemed calculated to strengthen the Christian family living on the land.

One of the most impressive activities of the conference was its annual convention. During the war years these could not be held on a national scale, but merely as regional or local events. Before the war, however, and again in 1946 the conventions drew hundreds of people from throughout the United States and Canada, along with thousands of residents of the convention city and its environs. In 1938 about 7,000 persons attended the open meetings of the convention at Vincennes, Ind. The 18th annual convention, held at St. Cloud, Minn., in 1940, drew 10,000 to the general meetings.

In 1942, the 20th convention, held at Peoria, Ill., was attended by 12 bishops and 500 priests, professors and farm leaders from 42 states. One feature of this particular convention was a joint luncheon held with 60 non-Catholic rural-life leaders and presided over by Bishop Muench of Fargo, N.D.

The 1946 victory convention was held at Green Bay, Wis., from Oct. 11 to 15. Eighteen bishops were in attendance and participated in the pontifical mass celebrated in the Cathedral of St. Francis Xavier. One day of the convention was devoted to farm organizations. Representatives from national offices of the Farm Bureau federation, the National Grange and the Farmers union participated in a panel discussion and addressed the group. First and most important resolution coming out of the Green bay meeting was that favouring the admission of several hundred thousand refugees from eastern Europe, some of them to be settled on the land.

James Byrnes (1938). (J. LAF.)

Catholic Welfare Conference, National

The National Catholic War council, one of seven welfare agencies recognized by the United States government, came into existence during World War I. The wartime experience of the council demonstrated the possibility and desirability of U.S. Catholics co-operating in a nation-wide agency for the advancement of religious and social interests, and after the war the National Catholic Welfare conference was brought into existence. The functions such a body could perform had already been indicated by Pope Benedict XV in the brief "Communes" issued on April 10, 1919. In September of that year the bishops of the United States formally set up the National Catholic Welfare conference.

To evaluate the work of the conference in later years and during the decade 1937-46, it is necessary to recall its nature and organization. The N.C.W.C. was not conceived as a legislative body or a council in the strict canonical sense of the word which makes laws binding all U.S. Catholics. Rather it was to be a conference, approved by the Holy See and incorporated under the laws of the District of Columbia, with the purpose of unifying, coordinating and organizing the Catholic people of the United States in the works of Catholic action, education, social welfare, immigrant aid, relief and similar activities. The bishops themselves, in a joint pastoral letter on the subject, indicated this objective: "We have grouped together under the N.C.W.C., the various agencies by which the cause of religion is furthered. Each of these, continuing its own special work in its chosen field, will now derive additional support through general co-operation."

Every bishop, by reason of his position, was to become a member of the conference. In addition to offering the bishops numerous helpful services it provided them with an opportunity for discussing policies affecting the interests and activities of the church in the United States. Each year, under the auspices of N.C.W.C., the bishops of the country continued to meet together for a week of consultation and discussion. At these meetings, matters of policy were taken up, the annual reports of the various N.C.W.C. departments were presented, officials elected or appointed, and a program of action mapped out for the coming year. The administrative bishops continued to report annually upon the work of the conference to the Holy See.

Over the N.C.W.C. and guiding its policies an administrative board of ten archbishops and bishops was established—elected each year at the annual meeting—with no bishop to serve on the board for more than five consecutive years. The administrative board members elected in 1946 were: Archbishop John T. McNicholas, O.P., of Cincinnati, O., chairman; Archbishop John Gregory Murray of St. Paul, Minn., vice-chairman; Bishop John M. Gannon of Erie, Pa., treasurer; Bishop Michael J. Ready of Columbus, O., secretary; Archbishop Joseph F. Rummel of New Orleans, La.; Archbishop John J. Mitty of San Francisco, Calif.; Archbishop James H. Ryan of Omaha, Neb.; Archbishop Richard J. Cushing of Boston, Mass.; Archbishop Robert E. Lucey of San Antonio, Tex., and Bishop Karl J. Alter of Toledo, O.

The administrative board continued to be assisted by episcopal chairmen or assistant bishops who supervised the work of the various departments of N.C.W.C. In 1946 the administrative board elected the following to so assist: Bishop Richard O. Gerow of Natchez, Miss., in the youth department; Bishop William D. O'Brien, auxiliary of Chicago, Ill., assistant treasurer; Bishop Thomas K. Gorman of Reno, Nev., in the press department; Bishop

Bryan J. McEntegart of Ogdensburg, N.Y., in the legal department; Bishop John P. O'Hara, C.S.C., of Buffalo, N.Y., in the department of Catholic action study; Bishop William S. Scully, coadjutor of Albany, N.Y., in the department of education, and Bishop Emmet M. Walsh of Charleston, S.C., in the department of lay organizations. Mgr. Howard J. Carroll was again named general secretary of N.C.W.C.

During the decade 1937-46, the chairmanship of the administrative board was held for the most part by Archbishop (later Cardinal) Edward Mooney. In 1939, Archbishop Mooney was succeeded for a year by Archbishop (later Cardinal) Samuel A. Stritch. Archbishop Mooney was successively elected to the post in 1940, 1941, 1942, 1943 and 1944. Archbishop Stritch held the chairmanship for the year beginning with the bishops meeting in Nov. 1945. In 1946 Archbishop McNicholas became chairman.

In the years immediately preceding United States entry into World War II, the administrative board of N.C.W.C. showed itself concerned with the trend world affairs were taking. During 1936 a committee of bishops had been instructed to study the problem of Catholic refugees. When they made their report at the November meeting of bishops, the Catholic committee on refugees was organized, to provide assistance for Catholics who because of persecution, racial, political or religious, had become refugees from their homeland. In Jan. 1937, the committee on refugees established its headquarters in New York city. The committee's activities included immigration aid, resettlement, job placement, guidance, relief to refugees. It also performed an interagency function, cooperating with Catholic and non-Catholic organizations engaged in similar work. The committee handled 2,756 cases in 1938 and 1939 and by Sept. 1946, some 7,060 cases had passed through its hands. Once the United States entered the war, the help which could be given refugees was necessarily restricted by shipping difficulties and the military situation. With the refugee problem once more looming large in 1946, the committee laid plans for extending help to those seeking resettlement.

Domestically, actions of N.C.W.C. and of the administrative board reflected conditions in the nation. In 1938 a plea was made for industrial and social peace. The same year a pastoral letter, sponsored by the entire U.S. hierarchy, outlined a program for Christian democratic action. In 1939 the conference celebrated the 20th anniversary of the joint pastoral letter following World War I and outlining a social program for the United States in conformity with Catholic social principles. It was significant that 10 of the 11 principal recommendations made by the bishops in 1919 had been wholly or partially translated into fact by 1939. On Feb. 7, 1940, a new and more comprehensive statement on the church and social order was issued by the administrative board of the conference. It emphasized the need and propriety of more equitable distribution of material wealth and of economic security for all members of the population.

In 1933 a special committee of bishops had been set up to study ways and means of raising the moral standards of motion picture entertainment. In April 1934, the Legion of Decency was formally begun. Catholics were asked to pledge themselves to remain away from objectionable films. In Feb. 1936 the bishops' committee on motion pictures transferred the responsibility for the review and evaluation of films from the various diocesan committees to the archdiocese of New York. The office of the National Legion

of Decency was located in that city. Each week it continued to issue a list of new films according to its judgment of their moral level. The following classifications were used: Class A—section 1: unobjectionable for general patronage; class A—section 2: unobjectionable for adults; class B: objectionable in part; class C: condemned. From Feb. 1936 up to the end of 1945, a total of more than 5,200 feature pictures, shorts and newsreels were classified. The work continued to be carried out by the motion picture department of the International Federation of Catholic Alumnae.

Another project carried out under the direction of a committee of bishops of N.C.W.C. was the systematic campaign in all dioceses of the United States against indecent periodical literature. The committee was originally appointed in Oct. 1939, under the chairmanship of Bishop John F. Noll of Fort Wayne, Ind. The headquarters were set up as the National Office for Decent Literature (N.O.D.L.), located in Fort Wayne. Evaluation of some 150 current periodical publications was carried out through the national office. Local campaigns generally took the form of blacklisting and boycotting objectionable magazines. Particular attention was focused on the problem of keeping obscene publications out of the reach of youth.

Another major development of the decade was the spread of the Confraternity of Christian Doctrine. The national centre of the confraternity was located at N.C.W.C. headquarters in 1934. Its services were used by 110 archdioceses and dioceses of the country at the end of the decade. The confraternity defined its chief function as that of providing for the religious instruction of youth not being educated in Catholic schools. This was done for those of elementary school age by providing special religious vacation schools and Sunday schools, and for those of secondary school age through discussion groups. At the college and university level Newman clubs continued to sponsor programs of religious instruction and discussion.

In 1940 need was seen for establishing a special department of N.C.W.C. to co-ordinate youth activities. The administrative board, at the bishops meeting of 1940, therefore set up a youth department. This department was organized with two types of youth groups in mind. One section was designed to co-ordinate the activities of diocesan youth organizations, already co-operating at the local level through the diocesan youth council. The other section looked after the needs of the National Federation of Catholic College Students and the Newman Club federation, representing youth in Catholic and non-Catholic institutions of higher learning respectively. Functioning under the youth department of N.C.W.C., was the National Catholic Youth council, originally launched as a project of the youth bureau established in 1937 by the administrative board. The youth bureau subsequently became the youth department.

During the years of World War II the activities of the N.C.W.C. were inevitably modified. Although the bishops continued to meet annually, other national meetings were curtailed. Attention of the conference was progressively directed to war-created needs and problems. The education department assisted the colleges in adjusting to wartime programs. It also stressed the need for better inter-American relations on a cultural basis. In Nov. 1941 the administrative board appointed a committee of bishops to study and publicize the peace points of Pope Pius XII. Archbishop Stritch was chairman of this committee.

In Jan. 1942 the bishops' committee on the Pope's peace points issued a statement advocating sincere and honest acceptance of the principle that international law is the basis of a just peace. In 1943 the committee issued a large volume entitled *Principles of Peace*, a compilation of papal pronouncements on the subject. In 1944 it facilitated publication of *A World to Reconstruct*, by Dr. Guido Gonella, translated by T. L. Bouscaren, S.J., dealing with the papal program for peace. Subsequently a digest of this work was published for popular usage.

Prior to Pearl Harbor, the bishops had recognized the need of co-ordinating community services for those in the armed services. In 1940 the National Catholic Community service was set up, as the over-all Catholic agency to be associated with the five similar agencies representing other faiths and groups. All of these agencies were co-ordinated in the United Service Organizations. In its first year of operations, N.C.C.S. set up 113 service centres.

One of the most important works undertaken by the conference during the war years was the printing and distribution of the Acta Apostolicae Sedis, official organ of the Holy See. In many countries, distribution of this documentary service had ceased after Dec. 1940. Under authorization of the Vatican, N.C.W.C. began reprinting it in Sept. 1943. In 1946 there were 1,589 subscribers to this service. Thirty-eight countries benefited.

At the November meeting of the bishops in 1942, a statement was issued declaring that the United States had been forced into the most devastating war of all times and that the conflict of principles made compromise impossible. At the 1944 meeting, a joint letter of sympathy was sent to the bishops of France, expressing concern for the damage done by air raids in French territory. Simultaneously a plea was made for freedom of religion in Poland, the Baltic states and neighbouring lands. After the Dumbarton Oaks conference on international order, the bishops issued a statement calling for peace without reservations or equivocations, according to the principles of the Atlantic charter. They favoured a world court endowed with power to demand execution of its decisions. When the issue of compulsory military training came up in the same year, the bishops expressed the wish that no decision be made until after the war, when a more thorough study of the matter might be made and the men returned from the service would have an opportunity to express themselves. For the time being, they said, extension of the selective service act would suffice.

In Jan. 1943 War Relief Services of N.C.W.C. was established. Its board of trustees comprised the administrative board of N.C.W.C. and the military vicar and military delegates. It administered a program of relief and assistance to refugees, victims of war, prisoners of war and merchant seamen. The administrative offices were located in the Empire State building, New York city. Tragedy visited the offices in July 1945, when an army plane crashed into the building, killing ten and injuring five employees. During the war W.R.S.-N.C.W.C. distributed aid to victims in 40 countries. Drives for food and clothing, as well as cash funds, were conducted.

Another part of the bishops' war program was the War Emergency and Relief committee, established in Nov. 1940. Its membership was identified with the administrative board. During the war, distribution of funds was made mainly through the Holy See, which was able to reach persons who might not otherwise have received assistance. Established Catholic charitable organizations in other countries were also used for distribution of funds. From Nov. 1941 to Dec. 1943, a total of \$2,615,493 was distrib-

uted. In 1944, another \$1,508,522 was distributed for relief.

During the war, the N.C.W.C. press department maintained several correspondents abroad. Two died in action. At the end of 1946, nearly 500 papers were served by the department. These included, besides virtually all Catholic papers in the United States, journals in nearly 40 other countries. Plans revealed in 1946 called for development of foreign news service and increased speed and accuracy in transmitting papal pronouncements. In 1941 Noticias Católicas, the Spanish-American section of the news service, was inaugurated.

In the course of the war years, the family life bureau began a series of conferences on marriage and the family. The papers read at these conferences were subsequently distributed in book form. Postwar plans of the bureau called for further development of these conferences. The first two were held at Catholic university in Washington, D.C. Future conferences were to be held in other cities. Similarly the social action department started conducting conferences on social problems and industrial relations. Held in various cities throughout the United States, these meetings drew hundreds of priests and laymen and were instrumental in propagating Christian principles of social life. The social action department also sponsored a statement on moral principles in economic life which appeared for Labour day, 1946.

Postwar plans called for the development of a Catholic commission on intellectual and cultural affairs, a professional organization dealing with problems of education and culture on a national as well as international level. The commission began its work in close harmony with the education department of N.C.W.C. The director of this department was named a member of the executive board of the National commission to U.N.E.S.C.O.

In 1946 the "Catholic Hour," heard each week over the NBC network, was in its 16th year and was carried on 106 stations. A similar program, the "Hour of Faith," was in its fourth year on the air over the American Broadcasting company network. Both these programs, together with the advisory Catholic Radio bureau, continued to be sponsored by the National Council of Catholic Men.

The National Council of Catholic Women in 1946 embraced 75 diocesan councils, 17 national organizations, seven state organizations and 138 affiliations in dioceses where the council had not yet been established. In addition to continuing its care for the National Catholic School of Social Work, in Washington, D.C., the council devoted itself to relief work and to helping foreign brides of returning servicemen. In Nov. 1946 the administrative board of N.C.W.C. issued a forceful statement on human rights. It called for peace and reconstruction in conformity with the dignity and supernatural destiny of man.

Catroux, Georges

Catroux (1879-), French army officer, the son of a general, attended the St. Cyr military academy and entered the foreign legion in 1899. He was an aide-de-camp to the governor of Indo-China, served with Marshal (then

Colonel) Louis Lyautey in the Algerian-Moroccan operations in 1911 and was an aide-de-camp to the governorgeneral of Algeria, 1911–14. In World War I, he served with the Algerian *tirailleurs* on the west front. Taken prisoner in 1918, he was released after the armistice.

Following World War I, he became governor general of Damascus. In 1926, he returned to Morocco, during the revolt of the Rif tribesmen, serving as head of army intelligence under Gen. Henri Giraud. Catroux, who became governor general of Indo-China in 1939, was ousted the following year by the Vichy government because of his refusal to permit dispatch of Japanese troops to the colony. He went to England, joined Gen. Charles de Gaulle's Free French movement and was named commander of Free French forces in the near east in 1941. Two years later, he became a member of the French Committee of National Liberation.

In Nov. 1943, Catroux went to Lebanon, where a crisis had been precipitated by the imprisonment of several Lebanese leaders for attempting to alter their constitution without French consent. Catroux, who subsequently charged that British interference was responsible for the disturbed political conditions in the Levant state, restored order by releasing the prisoners, thereby forestalling British military intervention. On Dec. 30, 1944, the French government disclosed that Gen. Catroux had been appointed ambassador to the soviet union.

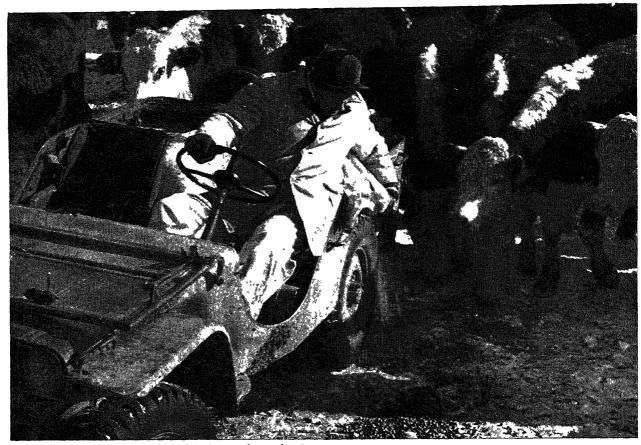

Cattle

World cattle numbers were estimated by the United States department of agriculture at 723,000,000 head, average 1936-40. A comparable estimate for 1944 was 712,200,ooo head. The decline was mostly in Europe, where numbers dropped about 12%. In the U.S.S.R. the decline was 22% and in Asia 6.8%. In the United Kingdom cattle numbers increased because of the emphasis on milk production. Denmark, Sweden and the Netherlands showed only small declines. Cattle losses caused by World War II were heavy in Belgium, France and Italy. In Germany, the cattle numbers were well maintained through the war until 1945, when a loss of 25% was estimated, particularly in eastern Germany. Poland was estimated to have only half the prewar numbers. The drought of 1945 reduced the number of animals in southern Europe, including Spain, Italy, Greece and the Balkans. Switzerland was reported to have increased breeding and to have a largerthan-average number of young stock. The U.S.S.R. replaced some of its losses from former axis countries. South America as a whole increased cattle numbers slightly during the war period. Argentina was reported to have 34,000,000 head in 1945 compared with 33,700,000 in the prewar period.

The number of cattle, including milk cows, increased steadily in the U.S. after 1870 with cycles of gain or loss of eight to ten years' duration. In 1937, a peak of increasing production had been passed; the prospect of war shortened the decline and turned production upward in 1938. From a total of 66,096,000 head in 1937 the increase continued through 1944, with a total of 82,364,000 head, the largest number on record. While the demand for meat was high and slaughter was correspondingly large in 1943-

Number of Cattle in the U.S., 1937-46

							(On Jan	uary 1)						
1937							66,096,000	1942	٠		٠			75,114,000
							65,249,000							79,162,000
1939							66,029,000	1944						82,364,000
1940							68,197,000							81,909,000
1041		_		_	_	_	71.461.000	1946			_	_		79.791.000

U.S. farmer using a jeep as a means of feeding cattle in otherwise inaccessible spots on his farm

44, the very large total was not sharply reduced in 1945 or 1946 but continued at around 80,000,000 head. This total included about 28,000,000 milk cows and 52,000,000 other cattle, principally beef animals.

The increase in cattle in the U.S. was the result of increased feed production, hay and grains, brought about by technical improvements and favourable weather. During World War II grain feeds increased about 30% and hay 18%. Large corn crops were of first importance, amounting to about 73% of the total feed grains. The increase in corn was due largely to the expanding use of hybrid seed. Another important factor in increasing the output of livestock products was the shift to mechanical power on farms.

The decline in feed required for horses and mules on farms and in cities was equivalent to about 50,000,000 acres of crop land and many million acres of pasture. It was estimated that the hay and pasture alone released for cattle feeding would provide for more than 16,000,000 head of cattle and calves.

The slaughter of cattle, including steers, cows and heifers, increased steadily after 1938, and in 1944 the slaughter of cows and heifers exceeded the total number of steers killed. During 1942 breeding herds were being increased and the heifers were kept on the farms. Total slaughter of cattle and calves was reported at 15,254,000 head in 1937 and 20,065,000 head in 1944. A decline began in 1945 and continued through 1946. Both beef and dairy cattle numbers declined.

The total production of U.S. meat per capita increased from an average of 125 lb. per capita in 1935-39 to 177 lb. in 1944. This included pork and mutton, and the sup-

ply of beef was at the high point in 1944. Per capita consumption of beef was estimated at an average of 54.8 lb. in 1935–39, 61.2 lb. in 1942 and 54.5 lb. in 1945. Meat production as a whole increased more than 40% during the war but military, lend-lease and other export demands were so large that civilian supplies increased only 20%. In early 1946, strikes in packing plants delayed slaughter until the government took over and operated the plants in late January. The meat supply was lower than the needs for civilian consumption and export in early 1946, and a smaller number of cattle were in feed lots. Feeder cattle shipped from public stockyards increased from 2,671,000 head in 1937 to 3,179,000 head in 1944 and declined in numbers slightly through 1943 to 1946.

U.S. beef cattle prices for all grades averaged about \$11.47 per cwt. in 1937 and declined slightly in 1939-41, then increased to an average of \$15.44 per cwt. in 1944 and to a top of more than \$18.10 per cwt. in Oct. 1946.

Cattle prices were slightly higher from Jan. to June 1946 than in the same period a year earlier. During the period when price control lapsed in July 1946, beef-cattle prices rose to the record level of \$30.25 per cwt. for a few loads at Chicago, Ill. When price ceilings were restored on Sept. 1, prices declined but reached new records when ceilings were ended in October.

Government subsidies were paid to U.S. livestock slaughterers and producers to hold down the price of meat to consumers and to stimulate production. Slaughter payments were begun in July 1943 and continued through 1945. In early 1945 the Commodity Credit corporation began the payment of 50 cents per cwt. to producers for heavy cattle. Such payments amounted to about \$14,500,000 in 1945 on more than 2,800,000 head of cattle. This

subsidy continued to June 30, 1946. (See also Dairying; Livestock; Meat.)

Cement

World data on the production of cement were so fragmentary during World War II that it was difficult to secure an approximation of the total. In 1939, the world total was about 103,000,000 short tons or 513,000,000 bbl., declining to 80,000,000 tons or 400,000,000 bbl. in 1942. Prewar producers of amounts in excess of 1,000,000 tons annually, in decreasing order of magnitudes, were the United States, Germany, Great Britain, Japan, U.S.S.R., France, Italy, Belgium, Czechoslovakia, Poland, Argentina, India, Sweden, Canada and South Africa. In 1937, these countries accounted for 85% of the total output, and 50 others for the remainder.

While world cement production declined appreciably after 1939, production in the United States was increased by the construction demands for the war program, reaching a maximum in 1942. The salient features of the industry in the United States are shown in the accompanying table.

In 1944, U.S. production dropped to its lowest level since 1936, but with the close of the war a revival of building brought renewed activity. While the 1945 output was only 13% over that of 1944, by Aug. 1946 production had jumped to 16,213,000 bbl., a rate 6% higher than the monthly average in 1942, the peak year of war demand. U.S. shipments were even higher; the August rate of 17,-

955,000 bbl. was 15% above the 1942 average, and stocks had been pulled down from 20,000,000 bbl. to 9,300,000 after February.

The cement industry in Canada followed much the same course as that in the United States. Sales were 6,168,971 bbl. in 1937, declining to 5,519,102 bbl. in 1938, with recovery to 5,371,264 bbl. in 1939; war demand brought the figure to 9,126,041 bbl. in 1942, declining to 7,190,851 bbl. in 1944, while postwar building raised it to 8,378,341 bbl. in 1945 and 6,538,063 bbl. in the first seven months of 1946, a rate equivalent to 11,200,000 bbl. for the year. Censorship

Censorship in the United States during World War II was the most comprehensive in the nation's history, but it did not approach in severity the restrictions upon free expression which were in effect in many other countries. Communications entering or leaving American soil, by whatever means, were carefully scrutinized and passed, deleted, delayed or suppressed. In the domestic field the press and radio were brought under a voluntary program restricting the publication or broadcast of many classes of information. In all its aspects, however, the censorship dealt only with war security. No attempt was made to suppress opinion or criticism of the government. As a result, censorship concluded its operations amid general praise both from the public and from the military, and even the most zealous guardians of civil liberty appeared satisfied.

For the first time, all censorship authority (except that exercised by the military over its own personnel and war correspondents abroad) was centred in a single individual, the director of censorship. He had under him a staff which at the peak of its activities numbered in excess of 14,000, stationed in Washington, D.C., and at strategic points around the perimeter of the country. The agency which the director headed was known officially as the U.S. Office of Censorship. It was an independent civilian agency responsible only to the president. It came into existence Dec. 19, 1941, 12 days after the attack on Pearl Harbor. It ceased all censorship operations on Aug. 15, 1945, a few hours after the surrender of Japan, and had completed liquidation and passed completely out of existence on Nov. 15, 1945.

The agency had two types of responsibility. It withheld from the axis information which might be of value to it, and it collected information which would be of value to the U.S. in its prosecution of the war. The great bulk of its personnel and expenditures had to do with the censorship of international communications, in which operation it handled daily about 1,000,000 pieces of mail, and

some 50,000 cables, radiograms, telegrams across the border and international telephone calls, besides numerous other instruments, such as papers carried by travellers. It was entirely from the physical interception of such international communications that the Office of Censorship was enabled to turn over to

A slashed news dispatch of 1942 from the Solomon Islands, after it had passed through U.S. naval censorship

other war agencies a tremendous mass of information relating to such subjects as the operation of spies and attempts to circumvent wartime financial regulations and conceal or export strategic material illegally.

The voluntary domestic censorship of press and radio paid no similar tangible dividends of intelligence but was entirely on the side of repression. A similar voluntary operation had been undertaken in previous wars, but never on so broad a scale. Not only newspapers and broadcasting were asked to co-operate, but detailed attention was given also to magazines, books, house organs, church and school publications, private radio-telegraph systems and police, highway and other governmental radio.

Prior to the outbreak of the war, all planning for censorship had been in the hands of the army and navy. The army made plans for censorship of mails and trained a number of reserve officers in postal censorship techniques. The navy devoted its planning to the field of electrical communications and operated similarly a training school for naval reserve officers. A recommendation by a joint army-navy board that plans also be made by the services for the censorship of press and broadcasting was rejected by Press. Roosevelt.

The navy's preparations advanced far more rapidly than did those of the army. Beginning in Sept. 1939 the navy undertook to build an actual organization. It called a considerable number of reserve officers to active duty and stationed them as a skeleton staff at various cableheads. As a result, censorship of the cables actually began without specific legal sanction within a matter of a few hours after the first bombs fell on Pearl Harbor.

It was not until late in 1940 that the army began similar intensive planning and training in the field of postal censorship. Nevertheless, all of the postal censorship stations which had been planned were opening letters on a small scale by midnight of Dec. 13, 1941.

Censorship was first buttressed with legal sanction on Dec. 18, 1941, with enactment of the First War Powers act, section 303 of which authorized the president to cause all communications entering and leaving the country to be censored. A penalty of \$10,000 fine and ten years imprisonment was provided for wilful attempts to evade such censorship. On Dec. 19 the president signed an executive order creating an Office of Censorship, appointing a direc-

tor of censorship, and authorizing the director to censor international communications in "his absolute discretion." Neither the First War Powers act nor the executive order of Dec. 19 mentioned censorship of the domestic press or of broadcasting. Separately, however, the president wrote the director asking him to supervise a system of voluntary co-operation.

In general, these steps re-established the functions exercised by censorship during World War I, although the machinery for exercising those functions was quite different. In World War I, final censorship authority over international communications was vested in a committee representing the army and navy and other government agencies, while voluntary censorship of the press was under the supervision of a separate Committee on Public Information. Furthermore, the Committee on Public Information also supervised the handling of government information and propaganda, a duty which in World War II was no part of censorship but became the responsibility of the Office of War Information. The latter agency had no connection whatever with the Office of Censorship. The new arrangement had the great advantage of centralizing in a single person all decisions relating to censorship but at the same time keeping the censors free from entanglement in fields other than censorship.

To the post of director of censorship the president appointed on Dec. 19, 1941, Byron Price, a newspaperman who had served in Washington more than 20 years and subsequently was executive news editor and acting general manager of the Associated Press. The appointment was completely nonpartisan, the new director never having been a member of any political party or faction. Announcing the appointment, Pres. Roosevelt outlined the bases of the censorship as follows:

"All Americans abhor censorship, just as they abhor war. But the experience of this and of all other nations has demonstrated that some degree of censorship is essential in war time, and we are at war.

"It is necessary to the national security that military information which might be of aid to the enemy be scrupulously withheld at the source.

"It is necessary that a watch be set upon our borders, so that no such information may reach the enemy, inadvertently or otherwise, through the medium of the mails, radio or cable transmission, or by any other means.

"It is necessary that prohibitions against the domestic publication of some types of information, contained in long-existing statutes, be rigidly enforced.

"Finally, the government has called upon a patriotic press and radio to abstain voluntarily from the dissemination of detailed information of certain kinds, such as reports of the movement of vessels and troops. The response has indicated a universal desire to cooperate."

The largest single task confronting the new agency was censorship of international mail, conducted by a Postal division of the Office of Censorship which at its peak had more than 10,000 employees, including some 2,000 who read letters to and from prisoners of war. Postal censorship was carried forward by Major (later Brigadier General) W. Preston Corderman, U.S. army, who had been in charge of war department planning. He was appointed an assistant director of censorship. A year later, when he was recalled by the army, he was succeeded by Lieut. Col. (later Col.) Norman V. Carlson. Also appointed an assistant director in charge of the censorship of all international communications by electrical means was Capt. H. K. Fenn, U.S. navy, who had been in charge of navy department planning. He continued as the head of the Cable division

throughout the war. These officers and all others who served in the Office of Censorship, although a part of the military establishment, were responsible in their censorship duties only to the director of censorship.

While the Postal and Cable divisions were completing their organization, the director appointed John H. Sorrells, executive editor of the Scripps-Howard newspapers, as assistant director in charge of the Press division, and J. Harold Ryan, general manager of the Fort Industries which operated six radio stations in the south and middle west, as assistant director in charge of the Broadcasting division. Both of these new assistant directors were installed by Jan. 1, 1942. Sorrells some months later was promoted to deputy director, second in command of the entire Office of Censorship. He was succeeded by Nat R. Howard, editor of the Cleveland News, who in turn was succeeded by Jack H. Lockhart, managing editor of the Memphis Commercial-Appeal. Lockhart also returned to newspaper work May 1, 1945, and was replaced by Theodore F. Koop of the National Geographic magazine, who had been from the beginning personal assistant to the director.

So that the public would know specifically what was required, the Office of Censorship published early in 1942 a set of regulations for censorship of mail and cables, and a Code of Wartime Practices for press and radio. Some 300 categories of information having to do with such subjects as shipping, planes, troops, fortifications, war production, armaments and weather were listed as a guide to what could not be mentioned in international mail or messages and ought not to be mentioned in domestic publication or broadcast. In case of doubt, editors and broadcasters were requested to consult the Office of Censorship.

With a few exceptions the code was identical for press and broadcasting. One exception was the weather. The press was asked to print only limited official forecasts while radio, because of the possibility of instantaneous reception by the axis, was asked to omit all reference to the weather entirely. It also was asked that certain types of radio programs in which the public participated in such a way that an axis agent might gain control of the microphone and send a code message, be discontinued for the duration. The response of press and radio was instantaneous and uniformly excellent.

As the agency developed, two other divisions were added. The Reports division was given the responsibility of screening and disseminating to interested war agencies valuable

Photographed in 1941 by special permission of the U.S.A.A.F., this picture shows a row of Lockheed Hudson bombers earmarked for Great Britain. Guard at the left was a member of the Lockheed police force

information intercepted in the mails and cables. All such information was passed along under the most rigid secrecy on special forms carrying in each instance the following notice:

"The attached information was taken from private communications, and its extremely confidential character must be preserved. The information must be confided only to those officials whose knowledge of it is necessary to the prosecution of the war. In no case should it be widely distributed, or copies made, or the information used in legal proceedings or in any other public way without express consent of the Director of Censorship."

As the head of the Reports division, the director appointed A. D. Durford, a career official in the bureau of internal revenue. He was succeeded after some months by Harold Keats, a retired lawyer and businessman.

The Technical Operations division was added in Aug. 1943, to devote its entire attention to counterespionage, which formerly had been handled piecemeal in various other divisions. The Technical Operations division established its own laboratories for the detection of secret inks and other means of attempted evasion of censorship. This division was headed by Lieut. Col. (later Col.) Harold R. Shaw. It established the closest relations with the technical experts of other Allied censorships and worked also in the closest liaison with such agencies as army and navy intelligence, the Federal Bureau of Investigation, and the Office of Strategic Services. The Office of Scientific Research and Development also rendered notable assistance, conducting exhaustive experiments and devising in secret some entirely new laboratory techniques, of particular value in the examination of suspected pieces of mail.

Holding to its cardinal principle that "What does not concern the war does not concern Censorship," the office rigidly refused the requests of various other agencies that it report information on circumvention of tax and other peacetime laws and suppress news for policy reasons. The result was that censorship's contribution was entirely to national security, and not to politics or public morale or any other extraneous part of the U.S. scene. That contribution was, of course, immeasurable, since it would be impossible to set a value on the preservation of American life and individual liberties. Thousands of pieces of information which unquestionably would have helped the axis in one degree or another were kept out of the press and off the air, and were deleted from international communications.

Although thousands of persons were engaged in the manufacture of the atomic bomb, and hundreds of newspaper and radio reporters knew in a general way what experiments were in progress, use of the bomb over Hiroshima came as a complete surprise to the Japanese. The landing in North Africa and the time and place of the later landing in Normandy, the conferences between the president and the war leaders of other countries at Casablanca and elsewhere and a host of other developments of the highest importance likewise were successfully blacked out until the proper time. To the very end Japan was kept guessing about the results of its balloon invasion of western U.S., and the lack of reports probably led the Japanese to conclude that the balloons were not arriving at all.

Although these accomplishments on the side of defense were important, they were overshadowed in the view of many responsible officials by the more affirmative and tangible achievements on the offensive side of warfare. Never before had censorship been used so intensively or

so successfully as a weapon of offense. A considerable number of spies were apprehended as the result of the discoveries and investigations of the Postal, Cable and Technical Operations divisions. Not so dramatic but no less important were censorship's activities in the economic field. Hundreds of pieces of economic intelligence were turned over daily to the Foreign Economic administration, the War Production board, and other agencies having to do with wartime financial and commercial controls. Previously unreported stockpiles of strategic materials were uncovered, not only in the U.S. but in many other parts of the world. Literally hundreds of efforts to export goods and funds illegally were uncovered and stopped.

Axis interest in many firms, particularly in Latin America, was disclosed, and the movement of axis funds throughout the world was paralyzed by the globe-circling censorship network which the Allies were eventually able to perfect, and of which U.S. censorship was a highly important part. The naval blockade would have been far weaker except for the flow of information constantly provided to the naval authorities by censorship.

Complete co-operation with the censorships of Great Britain, Canada, France and various other countries, including those of Latin America, was a prime objective. Intercepted information was exchanged freely, and a constant liaison was maintained for the exchange also of technical censorship information. Co-operation with the British was particularly close, since the two censorships were seeking a common end, and were not interested, as were some other national censorships, in collecting intelligence not directly related to the war. Eventually the British and U.S. censors found themselves operating under almost identical regulations.

As the Office of Censorship gained experience, it was possible to exercise a much greater selectivity of censorable material and so to effect economies. The growth of foreign co-operation also simplified the task, as did the additional fact that the progress of military operations and the defeat of the German submarine isolated the axis more and more definitely from communication with the outside world and thus rendered some of the more rigid restrictions no longer necessary. Even before the collapse of Germany, a number of the smaller censorship stations throughout the country and abroad were closed, communications between the mainland and the outlying territories were freed of censorship, and various administrative consolidations were effected. Still further economies were accomplished after the German defeat. These retrenchment policies were enforced through the constant effort of Robert L. McKeever, a Washington real estate dealer, who served as administrative assistant in charge of budget and personnel.

During the first months of its operation, the agency was financed by a \$7,500,000 allocation from the emergency fund of the president. Subsequent congressional appropriations were as follows: For the fiscal year 1943, \$26,500,000; for the fiscal year 1944, \$29,600,000; for the fiscal year 1945, \$29,700,000; and for the fiscal year 1946, \$13,000,000. During its existence the agency actually spent about \$16,500,000 less than its total appropriations. About half of this saving was caused by the fact that operations ceased early in the fiscal year 1946.

Although in general the Office of Censorship was a target of less criticism than most war agencies, it underwent congressional investigation on two occasions. Late in 1942. Gov. Ernest Gruening of Alaska made a public pro-

test against censorship of mail between Alaska and continental U.S. Several hearings were held by the Senate Judiciary committee. Atty. Gen. Biddle, Director Price and representatives of military intelligence, naval intelligence, and the Federal Bureau of Investigation, went before the committee with evidence not only of the legality of this censorship, but of the important intelligence it was producing. The investigation was allowed to die and the censorship continued. In 1944, in spite of the stringent precautions which surrounded the distribution of information taken from private mail, some letters between a woman manufacturer in Connecticut and a German count in Argentina were published in the newspapers. The senate established a special investigating committee and extensive hearings were held, but the source of the information never was established and the committee discontinued its sessions and made no report.

Following to the last its conviction that censorship was permissible in a democracy only as a war measure, the Office of Censorship had ready early in 1945, detailed plans for its own liquidation. When the surrender of Japan was announced on the night of Aug. 14, 1945, the director asked Pres. Truman for authority to cease all censorship operations and to give 30 days notice to all employees except for a small group needed for liquidating the agency. The president gave his approval, and on the afternoon of Aug. 15, censorship came to an end. Thirty days later 95% of the staff were off the government pay roll, and 90 days later, on Nov. 15, the agency was finally abolished, having liquidated all of its property, personnel, contracts and records. Its secret files containing watch lists, case histories, and excerpts from letters and messages were reduced to microfilm and deposited in the national archives under a seal which could be broken only on the order of the president.

(B. PR.)

British Censorship.—With the outbreak of World War II, an organization was established, almost unnoticed, at all ports under Allied control, for the censorship of overseas correspondence. It operated as a branch of the security services, and its object was as much to obtain intelligence from axis communications as to prevent information of value reaching the axis.

The censorship of the press presented a more difficult problem. A free press was still one of the liberties to which the British people remained strongly attached, yet there was no surer nor speedier way of giving information to the axis than by means of an uncensored press. Parliament therefore decided on a voluntary system of censorship for United Kingdom press, periodicals, books and films, but permission to take photographs of war interest was made dependent on submission to censorship prior to publication. Apart from this obligation, editors and publishers were under no compulsion to submit material before it was published, nor even to abide by the censor's deletions in material which had been submitted. Like the ordinary citizen, however, they could be prosecuted under defense regulation three, for communicating to any other person, or publishing, information which might be useful to the axis, unless official sanction had been given to do so. A pamphlet entitled The Defence Notices was therefore produced to assist them. It contained a list of subjects on which editors were asked not to publish information without prior censorship advice. Material thus submitted was censored by a special department of the ministry of information called the press censorship. Experience soon proved, however, that *The Defence Notices* were too comprehensive and went beyond the limits of military security, on which ground alone the censors had authority to give advice. Early in 1940, the pamphlet was revised in consultation with representatives of the press. From then onward the press censorship was operated on a truly voluntary basis, the subjects for submission having been agreed upon both by the government departments concerned and the press, and rapidly gained the confidence and co-operation of the press. Late in 1941 regional press censorship units were set up in seven provincial towns to enable provincial newspapers to submit their material locally.

The censorship of all material leaving the United Kingdom, whether by telegram, telephone, wireless or mail, and intended for publication in the press overseas, was made compulsory and was also a press censorship responsibility. Voluntary censorship in this case was neither practicable nor considered safe since a message once dispatched passed out of control. Apart, however, from a period of two years beginning March 1942, when outgoing messages were subject to a limited degree of political censorship, material for the overseas press and for the home press was censored on similar lines.

British Broadcasting corporation broadcasts were treated as home press material and were censored under the supervision of the press censorship by censors at Broadcasting house.

War correspondents' dispatches were dealt with by military censors at general headquarters in the area of operations. These censors were trained initially at the press censorship and operated in general in accordance with its principles. (See also Civil Liberties; Newspapers and Magazines; Popular Culture; Radio.) (G. P. T.)

Census Data, U.S.

The 1940 census of population in the United States covered a decidedly wider field than any earlier census. The expansion brought in many new topics, including extensive data on housing, derived from a separate housing schedule; data on migration between 1935 and 1940; an elaborate classification of the labour force by employment status, hours worked, income, etc.; and data on families and fertility-these last mainly from a 5% sample tabulation. Innovations in the way of geographic areas included selected housing data by city blocks; many tabulations for metropolitan districts (providing information formerly available only for the central cities); population and housing data for census tracts (permanent statistical subdivisions) in 60 cities, and much additional data for counties, townships and the smaller incorporated places. The 1940 statistics presented herewith consist mainly of national totals, which present the over-all picture in each field and are also suggestive of data to be found for states, cities, counties and smaller areas in the voluminous reports of the 16th decennial census.

A considerable part of the later data, that is, of the figures for dates subsequent to 1940, is based on a monthly survey of a sample of 25,000 or 30,000 representative households scattered throughout the United States, made primarily as a basis for the monthly report on the labour force and, by reason of the relatively small size of the sample, subject to a larger degree of sampling variation than the sample-based figures of the 1940 census. With respect to even these figures, however, it may be said in general that the totals and the larger subtotals in a given table are subject to a fairly small error from this source, though the smaller and more detailed subtotals are sub-

ject to a possibility of error which increases with the decrease in the size of the figures in question.

Growth of Total U.S. Population.—The population of continental United States on April 1, 1940, the date of the 16th census, was 131,669,275, as compared with 122,775,046 on April 1, 1930, the date of the 15th census. The increase during the decade ending in 1940 thus amounted to 8,894,229 persons. While this is a considerable number, it represented a gain of only 7.2%, the smallest relative increase ever recorded in United States census history.

In 1790, when the first census was taken, the population was just short of 4,000,000. Each subsequent decennial census up to 1860 showed an increase of about one-third over the preceding census; from 1860 to 1910 the decennial increase was around 20% or 25%; for the next two census decades the figures were 14.9% and 16.1% respectively; and in the period from 1930 to 1940 the increase, as indicated above, was only 7.2%, or less than half the smallest previous increase. The data for the 16 censuses, including area as well as population, are given in Table I.

Table I.—Population and Area of Continental United States, 1790 to 1940

				increase		Popula-	
				preceding	census	Land area	tion
Census date			Population		Per	ın sq.mi.	per
				Number	cent		sq.mi.

*Revised flaure.

The land area of the United States in 1790 was only 867,980 sq.mi., or less than one-third of the 1940 figure, and the population density only 4.5 persons per sq.mi. The major additions were the Louisiana purchase of 1803; Florida, acquired in 1819; and three areas, the Oregon territory, the Mexican cessions and Texas, added between 1840 and 1850. With these last the country reached approximately its land area of 2,977,128 sq.mi., but much of this territory was so thinly settled in 1850 that the average population per square mile for the country as a whole was only 7.9. This average increased gradually with the increase in total population until in 1940 it stood at 44.2 persons per square mile of land area.

Month-to-month estimates for the population of the United States as a whole after 1940 were made on the basis of current records of births and deaths (adjusted for underregistration) and net immigration—the latter including the excess of arrivals over departures of citizens as well as aliens, and including movement between continental United States and the territories and possessions, as well as movement of population from or to foreign countries. The estimates for July 1 of each year are presented in Table II, together with similar estimates for the years 1937 to 1939, and an estimate for Jan. 1, 1946. These estimates represent the de jure population, including for 1942 and later years persons in military service overseas. The table also shows the annual increase and indicates what part of this increase was the result of the excess of births over deaths and what part resulted from the excess of immigration over emigration. (The estimates are pre-

sented to the last digit as computed instead of being rounded, not because they are assumed to be accurate to the last digit, but for convenience in summation.)

The population of continental United States on July 1, 1945, according to these estimates, was 139,-621,431, representing an increase of 1,537,982 over the population estimated for

July 1, 1944. The sources of this increase may be analyzed as follows. There were, during the year ending June 30, 1945, 2,970,284 births, from which may be subtracted 1,631,215 deaths, leaving a natural increase of 1,339,069, representing the major part of the population increase. The remainder was made up of net civilian immigration amounting to 198,913, including more than 15,000 persons coming into continental United States from the territories and possessions. The rate of increase for the year ending June 30, 1945, was 1.1%, which was slightly less than the rate of increase attained in some of the years just preceding, but much higher than the average annual rate of 0.7% for the decade 1930-40.

The estimated population on Jan. 1, 1946, was 140,386,-509, representing an increase during the 6-month period of approximately half that of the preceding year, though the contribution from net immigration was only 45,965, or less than one-fourth of the preceding annual figure.

The later acceleration in the rate of population growth resulted mainly from a very considerable increase in the annual number of births. During the year ending June 30, 1943, in which the birth rate reached its maximum, there were 3,209,177 births, as compared with 2,558,000 in the calendar year 1940 and an annual average of about 2,400,000 for the decade between 1930 and 1940. In the year ending June 30, 1944, the number of births had fallen to 3,016,562, and in the next year it was slightly less, namely, 2,970,284, though in either year it was still higher by about 600,000 than the prewar average.

The birth rate had declined steadily, and at times rather rapidly, from 1921 to 1936, with a slight increase between that date and 1940. The marked increase after 1940 may be attributed, first, to the business prosperity brought about by defense activities and then to the anticipation of conscription and of the actual entry of the United States into World War II. The number of deaths during these years, however, increased only slightly, even with war casualities included, amounting in the year ending June 30, 1945, to only 1,631,215, or less than 200,000 above the figure recorded for 1941.

While it was difficult to make valid assumptions with respect to the trend of population growth in future years under the unsettled conditions characterized by the ups and downs in the birth rate and especially in the marriage rate, there was so much demand for some indication of the future prospects with respect to the growth of population in the United States that an elaborate series of population forecasts was worked out. A summary of the total population indicated by these forecasts is presented in Table III for decennial dates up to the year 2000. The predicted increase of 10.5% in the population during the decade ending in 1950 represented an annual average for the decade only slightly less than the annual rate prevailing in the mid-decade year 1945, but a rather rapid decline in the rate of increase was forecast for succeeding

(Estimates from 1942 to 1945 include armed forces overseas)

The population estimates discussed above represent what has been termed the de jure population of the United States, including persons in the armed forces overseas, this being the type of estimate most closely comparable with the actual census figures of earlier years. Two other types of estimates were made, however—an estimate of the civilian population, excluding all persons in the armed forces (United States total for 1945, 127,409,297) and an estimate of the population excluding persons in the armed forces overseas but including those stationed in the several states (United States total for 1945, 131,975,-774), which last was sometimes referred to as the de facto population. While it was possible to make fairly accurate estimates of the total population of the United States on each one of these three bases, similar estimates could not readily be made for individual states or regions because of the fact that there were no satisfactory data on interstate migration. In response to insistent demand, however, estimates of the population distributed by states were made in accordance with the two definitions just mentioned. The best information available as a basis for the distribution of population data by states was a series of estimates of the civilian population in Nov. 1943, based on the registration for the last of the war ration books. Estimates for 1945 were made on the assumption that the interstate migration indicated by the 1943 estimates had continued at a decreasing rate for the period from 1943 to 1945. These estimates, for the civilian population, which would seem to be on the whole the more useful of the two series of state estimates, are presented in Table IV, together with an additional column representing the net loss of each state to the armed forces during the period ending July 1, 1945. This last column represents approximately the difference between the civilian population and the total population including persons in the armed forces overseas. This figure may be considered in connection with the increase or decrease in civilian population in a specific state to give some approximation of the change in total population-that is, the change which would appear if all of the men in the armed services were to return to the state of their preservice residence. The

Table IV.—Civilian Population, 1945 and 1940, with Estimated Net Loss to Armed Forces, by States

state of Maine, for example, showed a loss in civilian population between 1940 and 1945 amounting to 72,560, but this figure was slightly less than the number of persons who went into the armed forces from the state of Maine. The state of Illinois showed a loss in civilian population of 339,-218, but this loss was only somewhat less than half the contribution of that state to the armed forces, so that if all of its citizens in military service had returned the state would have shown a considerable increase in population. In those states, on the other hand, where even the civilian population showed a substantial increase, the addition of the numbers contributed to the armed forces would have made the increase still more substantial.

The total civilian population of the United States was 3% smaller in 1945 than in 1940, so that any state showing a decrease less than 3% may be considered to have had a relative gain. The absolute gains in civilian population up to 1945 were largely concentrated in a few western states, especially in California, with substantial increases shown also for the District of Columbia, Maryland, Florida and Virginia. Most of the increases represented migration to war production centres, and the largest de-

creases are shown for states in which there was little or no activity of this kind.

Apportionment.-The law under which the representation of the various states in the house of representatives is reapportioned on the basis of each succeeding decennial census was amended by an act of congress approved Nov. 15, 1941, to the effect that all reapportionments are to be made by the method of equal proportions, this being one of two alternative methods permitted under the law as it previously stood (the other method being that of major fractions). Under the method of equal proportions, after each state is assured of one representative, the additional representatives are so assigned that the average population per representative shows the least possible variation as between one state and another, both on an absolute and on a percentage basis; and the average number of representatives per 1,000,000 of the population shows likewise the least possible difference on a percentage basis.

*This column indicates, roughly, the extent to which the civilian population was smaller than the total population of the states which would be comparable with the estimated total for the United States "including persons in the armed forces overseas."

Under this method, in the reapportionment based on the 1940 census, California gained three representatives, and six other states, namely, Arizona, Florida, New Mexico, North Carolina, Oregon and Tennessee each gained one. To balance these gains, since the number of representatives in the house was not changed, the following nine states each lost one representative; Illinois, Indiana, Iowa, Kansas, Massachusetts, Nebraska, Ohio, Oklahoma and Pennsylvania. The complete apportionment, which went into effect with the 78th congress, elected in 1942, is shown in Table V, with comparative figures indicating the changes from the apportionment based on the census of 1030.

Under the discarded method of major fractions, which measured deviation from equality among states solely by numerical difference in average number of representatives per 1,000,000 of population, Arkansas would have lost one representative to Michigan. Under the 1940 apportionment of 7 representatives to Arkansas and 17 to Michigan.

igan, the average number of representatives per 1,000,000 is respectively 3.5909 and 3.2343, with a difference of 0.3566; with 6 representatives for Arkansas and 18 for Michigan, the respective averages would have been 3.0779 and 3.4246, with a (smaller) numerical difference of 0.3467. The percentage difference between the two figures based on the 1940 apportionment, however, is 11.02%, as compared with 11.26% after the proposed change; and on the basis of average population per representative, both absolute and percentage differences are smaller under the 1940 apportionment. The assignment of representatives to all the other states would have been the same in 1940 under either method; and in 1930, when both methods were in effect, there were no differences whatever in their assignments.

The state with the largest population per representative under the 1940 apportionment was Vermont, with 359,231; this state lost one of its two representatives in the reapportionment on the basis of the 1930 census, and thus suffered the largest possible (percentage-wise) reduction in representation. The state with the next to the largest figure (356,673) was Rhode Island, which lost one of its three representatives in the 1930 reapportionment; and the state with the next figure (328,959) was Nebraska, which lost one of its five representatives in the 1940 reapportionment. At the other end of the scale was Nevada, which by reason of its very small population and the constitutional requirement that each state should have one representative, had that one representative for a population of only 110,247.

Immigration and Emigration.—The immigration and emigration figures most frequently used continued to be

those representing arrivals in the United States (including its territories and possessions) from foreign countries and departures from the United States to foreign countries. Persons arriving in the United States continued to be classified as immigrant aliens, nonimmigrant aliens and citizens. Nonimmigrant aliens included persons in continuous transit through the United States, temporary visitors for business or pleasure, government officials, their families, attendants, servants and employees, etc. The figures for immigrant alien arrivals were exclusive of the relatively small number refused admission. The annual data on emigration and immigration as thus defined arc summarized for the years from 1937 to 1945 in Table VI. The figures shown in this table for later years are appreciably smaller than those given in Table II as an element in population increase, since the latter include arrivals in continental United States from the territories and possessions as well as from foreign countries. The number of such arrivals for the year ending June 30, 1944, was about 25,000, and for the year ending June 30, 1945, about 17,000.

The number of persons officially recorded as immigrants or emigrants in a given year represents only a small fraction of the whole number of persons who crossed the national borders. By far the major part consists of persons who crossed and recrossed, perhaps daily, for temporary purposes. The whole number of crossings during the fiscal year ending June 30, 1945, amounted to more than 57,000,000, of whom 28,000,000 were aliens. These figures may be compared with the total of 377,934 immigrant arrivals and 38,119 arrivals of immigrant aliens. (See also Immigranton and Emigranton.)

Births and Deaths.—The rise in the birth rate has already been cited as the principal factor contributing to the acceleration in the rate of population growth. In the calendar year 1944, 2,794,800 births were registered. This represented a decided increase as compared with the average of about 2,200,000 per year which prevailed from 1930 to 1940, but it was materially smaller than the maximum of 2,934,860 in 1943. The number of births registered in 1945 (approximately 2,744,000), was again smaller than in the preceding years, but this time only slightly smaller. It is evident, then, that while the birth rate showed a tendency to decline somewhat after 1943, the decline was moderate and the birth rate remained considerably higher than at any time between 1930 and 1940. It was anticipated that, with the return of service-

men from overseas and rapid demobilization, the birth rate might take another upswing and continue at thencurrent or somewhat higher rates for two or three more years, this view being supported by the rapid increase in the marriage rate in early 1946.

While the birth rate was relatively high, the death rate showed little increase over the average for the preceding ten years. Even military mortality, which amounted in total to around 300,000, was not sufficient to raise the number of deaths in any one year by more than about 150,000.

The most significant data on births and deaths which need to be considered in any study of trends in population growth are presented in Table VII, which gives for 1920, 1925, 1930, and each year from 1935 to 1945 the number of registered births and deaths and the annual rates per 1,000 of the population, based on registered data, these being the rates usually quoted. (See also BIRTH STATISTICS; DEATH STATISTICS.)

Table VII.—Registered Births and Deaths in the United States, With Rates, 1920 to 1945

(Figures for years prior to 1935 are for the registration area, representing, for births, 59.7% of the population in 1920, 76.2% in 1925 and 94.7% in 1930; for deaths, 80.9% in 1920, 88.1% in 1925 and 95.3% in 1930).

1945*	2,744,000	19.8	1,397,000	10.6

Marriages and Divorces.—The number of marriages in the United States increased rapidly under stress of approaching war conditions from 1939 to 1942 and then declined slowly in 1943 and still further in 1944 to a figure definitely below the 1940 level. The number of marriages in 1945 increased by 150,000 (to 1,618,331), but still was lower than the records of either 1941 or 1942. What actually took place in 1945 was a continued decline during the first half of the year, as indicated by the monthly reports of marriage licences issued, followed by a new increase in the second half based, first, on the promise of recovery from wartime restrictions and then reflecting the actual return of large numbers of servicemen from the war areas. The annual data from 1937 to 1945 for both marriages and divorces are summarized in Table VIII, with rates per 1,000 of the total population. Monthly reports on marriage licences issued in cities of 100,000 inhabitants or more (comprising about one-third of the total population of the United States) indicated that the increase in the marriage rate continued through the first half of the year 1946; in fact, the number of licences reported from these cities in the first six months of 1946 exceeded by more than 50% the number reported for the same months in 1945. These figures gave a strong indication that the number of marriages in 1946 would exceed by a considerable margin the earlier peak of 1,772,132 attained

In comparison with the ups and downs of the marriage rate, the divorce rate showed a steady increase from 1938 to 1945. The number of divorces granted in the years from 1937 to 1940, inclusive, was around 250,000 and the rate around 2.0 per 1,000 of the total population. In the next four years there was an annual increase of about 11%

in the number of divorces, bringing the number up to 400,000 in 1944, with a rate of 2.9. The increase in the number of divorces in the next year amounted to more than 25%, the total of 502,000 divorces granted in 1945 representing 3.6 per 1,000 of the population. While the ratio of divorces to marriages must be interpreted with duc regard for the fact that the divorces represent the dissolution of marriages contracted in earlier years, running back in considerable numbers for 20 years or more, the increase in this ratio from 17.2 divorces per 100 marriages in 1937 and 18.1 in 1942, the peak year for marriages, to 31.0 in 1945 was surely significant. (See also Marriage and Divorce.)

Table VIII.—Estimated Number of Marriages and Divorces in the United States, 1937 to 1945 Rates are based on total population, including, for 1942–45, persons in the armed forces overseas)

Urban-Rural Areas.—The urban population continued to be treated as comprising in general all persons living in incorporated places (cities, towns, villages or boroughs) having a population of 2,500 or more, with the rural population comprising persons living outside such places. On April 1, 1940, the urban population numbered 74,423,702, and the rural population 57,245,573. In 1930 the urban population was 68,954,823, and the rural population 53,820,223. The increase in the urban population between 1930 and 1940 thus amounted to 5,468,879, or 7.9%, and the increase in the rural population to 3,425,350, or 6.4%. The urban population in 1940 formed 56.5% of the total population of the United States, as compared with 56.2% in 1930.

The growth of the urban population was very much slower in the decade 1930-40 than in the preceding decade -7.9% as compared with 27.3%; the increase in the rural population during the decade 1930-40, on the other hand, was more rapid, in spite of the decided slowing down in the rate of growth of the total population, than in the period between 1920 and 1930-6.4% as compared with 4.4%. To make the comparison between the two decades in another way: For the decade ending in 1930, the rate of urban growth was more than six times the rate of rural growth (27.3% as against 4.4%), while in the decade ending in 1940 the rate of urban growth was only slightly higher than the rural rate (7.9% as compared with 6.4%).

The marked decline in the rate of urban growth was attributable in large measure to the economic conditions prevailing in the 1930s. These conditions discouraged the movement of population from rural to urban areas and also reduced somewhat the rate of natural increase; hence the urban areas gained far less than in previous decades from the inflow of rural migrants, and somewhat less from the excess of births over deaths.

The decennial figures on urban and rural population are summarized for the entire period covered by the United States census, from 1790 to 1940, in Table IX. Estimates based on a small sample for 1944 indicated that the civilian urban population on that date amounted to 74,570,000 out

of a total civilian population of 125,150,000, or 59.6%, as compared with 56.7% in 1940, with a corresponding decline in the percentage rural from 43.3% in 1940 to 40.4% in 1944. These figures seemed to indicate a resumption of the urban trend which was in force up to 1930, but which was practically suspended during the decade ending in 1940.

1940	131,669,275	74,423,702	57,245,573	7.9	6.4	56.5	43.5

There were 3,464 urban places in the United States in 1940, as compared with 3,165 in 1930. The increase was the net result of the addition of 344 new places in the 1940 data, and the dropping of 45 places from the 1930 list. Most of the new urban units were incorporated places that attained a population of 2,500 or more during the decade 1930–40 and thus qualified as urban, although 20 of them were places not incorporated until after 1930. Of the 45 places taken off the urban list, most were dropped because of decreases to below the 2,500 limit, though a few disappeared through annexations to other urban places or disincorporation.

The urban and the rural population of the United States are presented in Table X, with further subdivision—the urban into groups of places classified according to size, and the rural into groups comprising small incorporated places and unincorporated territory.

Individual Cities.—According to the returns of the 1940 census, there were 37 cities in the United States having 250,000 inhabitants or more, the total population of these cities being 30,195,339. These 37 cities had a population of only 28,761,272 in 1930, thus showing an increase of 1,434,067 during the decade. This change represented an increase in population amounting to 5.0% between 1930 and 1940, as compared with 23.4% for the same cities between 1920 and 1930, the decline in the rate of increase between the two decades being somewhat greater for these cities than for the total urban population. The population of the individual cities making up the group having 250,000 inhabitants or more is shown in Table XI.

One city which was on the list of those with 250,000 inhabitants or more in 1930, namely, Akron, Ohio, fell out of the list in 1940 by reason of a reduction in population from 255,040 to 244,791. Its place was taken, however, by San Antonio, Tex., which came into the group through an increase in population from 231,542 in 1930 to 253,854 in 1940, so that the number of cities remained the same.

Metropolitan Districts.—Prior to 1940, census statistics were presented almost exclusively for geographic areas with legally established political boundaries, that is, for states, counties, townships and cities. To an increasing extent, however, the population tributary to a fairly large city was expanding into the area outside the corporate limits of the city. There was, therefore, an increasing demand for statistics relating to this entire area, including both the city and the thickly settled adjacent area. Metropolitan districts were established for the 25 largest cities in 1910, for 29 in 1920 and for 96 in 1930, but little information beyond total population was tabulated for these dates. In 1940, metropolitan districts were set up for all cities of 50,000 or more, 140 in all, and most of the important classifications presented in the census reports on population and housing were shown for the metropolitan districts -or at least for the more important ones-as well as for the central cities. This represented an expansion in the

geographic classification of the census figures perhaps even more important than the very great extension in the use of urban-rural areas which was incorporated in the reports of the 1950 census.

The general plan followed in setting up the metropolitan districts was to include in the district, in addition to the central city or cities, all adjacent and contiguous townships or other minor civil divisions and incorporated places having a population of 150 or more per square mile. A metropolitan district was thus not a political unit but rather an area including all the thickly settled territory in and around a city or group of cities. It tended to be a more or less integrated area, with common economic, social, and often administrative interests.

The .11 metropolitan districts having a population of 1,000,000 or more are listed in Table XII, which gives separately the population of the central city and the outside area in each district. As indicated by the figures in the last column of this table, there was a wide diversity among the cities in the relation between the population of the central city and the population outside, the differences representing mainly actual differences in the composition of the territory immediately surrounding the city.

Table XII.—Population of Metropolitan Districts Having 1,000,000 Inhabitants or More, 1940

District	Total	In central city (or cities)	Outside central city	Per cent outside

^{*}Population of Elizabeth, Jersey City, Newark and Patterson.

Sex Distribution.—Up to about 1940, the population of the United States contained a considerable excess of males. The sex ratio, that is, the number of males per 100 females, ranged from 103.3 in 1820 to high points of 105.0 in 1890 and 106.0 in 1910, both of which years had been preceded by the arrival of large numbers of European immigrants who were then dominantly male. The numerical excess of males in the 1910 population of 91,972,266 amounted to 2,692,288. Following 1910, however, there was a rather rapid decline in the sex ratio and correspondingly in the numerical excess of males over females, until in 1940 there were only 100.7 males per 100 females and less than 460,000 more males than females in the count of the population. In the estimates for July 1, 1944, the numbers of males and females were almost exactly equal, and the sex ratio, computed to the nearest tenth, was 100.0, while in 1945 there were 231,469 more females than males in the estimated population, or 99.7 males per 100 females. According to the forecasts made for 1950 and subsequent years, the excess of females would reach a maximum of

1,468,000 in 1970 (98.2 males per 100 females), then decline rather rapidly to 371,000 (or 99.5 males per 100 females) in the year 2000.

The sex distribution of the population of the United States, including current estimates and forecasts, is presented for the years from 1820 to 2000 in Table XIII.

Age Composition.—The population of the United States, like that of most industrialized countries, continued to grow older. Two factors contributing to this situation were the declining birth rate, which resulted in the addition of relatively smaller numbers of children to the population in successive generations, and the improvement in health conditions, which increased the span of life. The figures in Table XIV indicate the changing age composition of the population of the United States over a period of 100 years, comprising census figures for 1880, 1910 and 1940, estimates for 1945, and forecasts for 1950 and 1980. The percentage of the population under 15 years of age in 1880 was 38.1, which figure had declined to 25.0 in 1940. In 1945, by reason of the temporary increase in the birth rate commented on above, 25.1% of the population were under 15, and the effect of the higher birth rate carried forward into the forecast for 1950, which showed 25.7% under 15 years of age. By 1980, however, as indicated by the forecast, the earlier tendency would be resumed, and the percentage under 15 would be down to 20.9%—and down to 19.1% in the year 2000. Conversely, the percentage of the population 65 years old and over showed a continuous increase from 3.4% in 1880 to 6.9% in 1940 and 7.2% in 1945; according to forecasts, it would be 11.6% in 1980 and 13.2% in the year 2000.

The net effects of the changing age composition of the population can be more briefly summarized through the use of the median age, which may be defined as the age of the person who would stand at the midpoint of the series if the entire population were arranged in order according to age. These medians are presented for the years from 1820 to 2000, with figures for males and females and white and nonwhite, in Table XV. The median age increased from 16.7 in 1820 to 29.0 in 1940 and 29.7 in 1945, and was expected to reach 35.3 in 1980 and 37.4 in the year 2000.

The median ages for males and females were about the same as computed on the basis of the 1940 census, but the forecasts indicated that even in 1950 the median age for females would be higher by more than a year, with continued increases in this margin in subsequent decades. The median age of the white population in 1940 was 29.5 years, as compared with 25.2 for the nonwhite population.

Incidentally, the median age of the white population in 1940 was the resultant of combining the native white, with a median of 26.9, with the foreign-born white, with a median of 51.0. The median age of the foreign born was likely to continue increasing rather rapidly, though with declining numbers the higher ages of the foreign born would have less effect on the average for the total population.

Race and Nativity.—The white population formed practically the same proportion of the total population in 1940 as in 1930, the percentage being 89.8 in both years, though the rate of increase for the white population was slightly lower than for the nonwhite. The native white population taken alone increased by 10.9%. (See discussion of the various subdivisions of the white population below.) The Negro population increased by 8.2% between 1930 and 1940, or materially less than the native white, while the minor races collectively decreased by 1.4%. The distribution of the 1940 population of the United States by race is shown, by regions, in Table XVI.

The racial distribution of the population of the three regions was by no means uniform. The population of both the north (comprising all the states as far west as the Dakotas and as far south as Pennsylvania, Indiana and Missouri) and the west (comprising the states from Montana south to New Mexico and westward) was 96.2% white in 1940, while the population of the south (comprising the states from Delaware, Kentucky and Oklahoma southward) was only 76.0% white. The foreign-born whites formed 12.3% of the population in the north and 10.3% in the west, but only 1.5% in the south. More than threefourths of the Negroes were in the south; a little more than one-fifth were in the north (mainly in the cities). where they formed 3.7% of the population; and only a small number in the west, where they formed 1.2% of the population in 1940, though by reason of migration to warproduction centres their numbers in this region had materially increased by 1945. The other nonwhite races, mainly Indians and Mongolians, were largely concentrated in the west, where they formed 2.6% of the total in 1940, as against a small fraction of 1% in the north and the south.

The Negro population, it may be noted, was practically all (99.3%) native, as were likewise the Indians, while the Chinese were about evenly divided between native and foreign born.

Nativity and Parentage.

—While the percentage white in the total population of the United States remained practically unchanged from 1930 to 1940, the distribution of the white population by nativity and parentage changed

very materially during this period. The number of foreignborn whites decreased from 13,983,405 in 1930 to 11,419,-138 in 1940, or 18.3%. The native white population increased during the same period from 96,303,335 to 106,-795,732, or 10.9%. This increase, amounting to 10,492,397, exceeded by more than 1,500,000 the increase in the total population.

The native white population was further classified on the basis of nativity of parents into (1) persons of native parentage and (2) persons of foreign or mixed parentage. The second group was then further subdivided into those having both parents foreign born and those having one parent foreign born and the other native. This classification is shown in full detail in Table XVII.

The number of native white persons of native parentage increased 19.0% between 1930 and 1940, while the whole number of persons of foreign or mixed parentage decreased 11.0%, and those of foreign parentage, taken alone, decreased 13.2%. The changes in the proportion of the total white population represented by these various classes were perhaps even more significant than the changes in the absolute numbers. The percentage of the white population which was foreign born decreased from 12.7 in 1930 to 9.7 in 1940, and the percentage represented by native persons of foreign or mixed parentage decreased from 23.5 to 19.5, with corresponding increases in the percentages representing all native persons and natives of native parentage.

The decline in the proportion of foreign born was, of course, the direct result of the practical cessation of immigration from foreign countries during the decade 1930—40. The decline in the numbers of native persons of foreign or mixed parentage indicated that even the children of earlier immigrants were reaching the ages of heavy mortality and that because the foreign born were for the most part past the reproductive ages, there were few children to provide replacements at the lower end of the age scale.

Foreign White Stock.—The term "foreign white stock" was used in the census reports to indicate the combined total of two classes, namely, the foreign-born white and the native white of foreign or mixed parentage. The classification therefore included only those persons who were born abroad (sometimes referred to as the first generation)

and those who had at least one parent foreign born (the second generation) but not the third and later generations of persons of foreign ancestry—though these later generations sometimes retained many of the characteristics of the original immigrants.

In 1940, the foreign white stock numbered about 34,-600,000, or a little more than one-quarter of the total population of the United States. About 11,400,000, or roughly one-third of this number, were foreign born. Of the remaining 23,000,000, about 15,000,000 were persons with both parents foreign born; 5,000,000 had only the father foreign born, and something less than 3,000,000 had only the mother foreign born.

The foreign white stock is classified by country of origin in Table XVIII. In this table the foreign born are classified by country of birth; those with both parents or with father alone foreign born are classified by country of birth of father, and those with mother alone foreign born, by country of birth of mother. The 1940 classification was based on the political boundaries of the countries as they were on Jan. 1, 1937.

In comparison with figures for earlier years, the 1940 data for all of the countries in northwestern Europe indicated very considerable decreases in the foreign white stock of both first and second generations from these countries. This situation is to be explained mainly by the fact that the bulk of the immigrants from these countries arrived in the United States earlier than from most other regions of Europe. The foreign born in particular from these countries were in 1940 concentrated in the older age groups, where the rate of mortality was high. Similar rates of decrease were likewise shown for Germany, Poland and other countries in central Europe.

In spite of a decline from 6,873,103 in 1930 to 5,236,612 in 1940, the German foreign white stock was still the largest in 1940, followed closely by the Italian, with 4,594,780, or about one-seventh of the total. Other countries contributing more than 2,000,000 were Canada, Poland, the U.S.S.R. and Eire, with England just under this limit.

Farm Population.—The farm population, as shown in the population census reports, comprises all persons living on farms, without regard to occupation. Since only about 1% of the entire farm population was found in urban areas, the statistics of the urban-farm population were limited to a simple count of its number. The main body of the farm population statistics therefore relate to the rural-farm population, which, together with the rural-nonfarm and the urban, make up a threefold classification of the total population. Statistics for these three classes, together with data for the total farm population, are presented in Table XIX, which shows also the sex ratio of the three classes.

The increase in the rural-farm population between 1930 and 1940 amounted to only 0.2%, whereas the increase in rural-nonfarm population amounted to 14.2%, or almost twice the rate of increase in either the total rural population or the urban population.

The number of males per 100 females in the rural-farm population was decidedly larger than in the urban population, 111.7% as compared with 95.5% in 1940, while the rural-nonfarm group occupied an intermediate point in this respect, with 103.7 males per 100 females.

The total farm population, including the small urbanfarm group, likewise increased very slightly between 1930 and 1940; and in the preceding decade there was an actual decrease of 3.7% in this figure, which may be contrasted with an increase of 27.3% in the urban population. The farm population was estimated for dates subsequent to

1940 as follows: Jan. 1944, 25,520,000; July 1944, 26,220,000; Jan. 1945, 25,190,000; July 1945, 26,260,000; Jan. 1946, 25,990,000.

These estimates, it must be remembered, represented the farm-resident part of the civilian population, less by some millions than the normal total population, since the farm population, up to July 1945, had lost something like 1,500,000 through inductions into the armed forces—and in addition, between 2,000,000 and 3,000,000 more through net migration from farms to nonfarm areas, mainly war production centres.

Internal Migration.—A survey of the movement of the civilian population (omitting persons in institutions) between Dec. 1941 and March 1945 indicates that 15,210,000 persons in 1945 were living in a county different from that in which they lived in 1941. Of this number, 7,670,000 had moved from one state to another, and 3,580,000 had moved from one to another of the three regions designated the north, the south and the west, as indicated by the figures in Table XX.

Table XX.—Migrants by Type, Dec. 1941 to March 1945, and April 1935 to April 1940 (Data for migration 1941–45 based on a small sample)

Type of migration	migration, Migration, 1941–45 1935–4 (3½ years) (5 years)	40
Total migrants	15,210,000 15,734,7	
Between states		
Between regions		
Between states in same region	4,090,000 3,847,3	
Between counties in same state	. 7,540,000 9,239,7	49

The interstate migration in this three and one-fourth year period somewhat exceeded the migration recorded in the 1940 census for the five-year period 1935–40, in which, out of a total of 15,734,798 intercounty migrants, 6,495,049 had crossed state lines and 2,647,651 had moved from one major region to another. A better measure of the relative extent of internal migration, as between these two periods, is perhaps the average per year. The average number of interstate migrants per year in the later period was 2,360,000 as compared with 1,300,000 in the earlier (and longer) period. Even this difference, however, represented rather less of an increase in mobility than one would have expected to find as a result of war conditions, with the extensive migration of workers to centres of war production.

The specific origin and destination of the inter-regional migration during the two periods is shown in Table XXI. Thus, of the 1,550,000 migrants between 1941 and 1945 from the north to other regions, 640,000 were found in the south at the end of the period, and 910,000 were found in the west. Of the 1,630,000 migrants from the south, 980,000 were found in the north and 650,000 in the west; and of the 400,000 migrants from the west, 260,000 were found in the north and 140,000 in the south. The west thus gained 1,160,000 through this inter-regional migration, while the north lost 310,000 and the south 850,000. The general pattern of the inter-regional migration between 1935 and 1940 was similar, though the net gain of the west in this period was only 886,940, while the north lost 614,629 and the south lost only 272,311. In other words, the westward movement was heavier from the north in the earlier of these two periods, and from the south in the later period.

Another feature of the survey just referred to was a question on farm residence at the beginning and the end of

the period covered. The answers to this question, summarized in Table XXII, indicated that 5,440,000 people moved from farms to nonfarm areas, while 2,510,000 were found living on farms in 1945 who had been living in nonfarm areas in 1941. In this exchange the farm population sustained a net loss of 2,930,000. During the same period, the farm areas also lost about 1,500,000 through enlistments and inductions into the armed forces.

Table XXII.—Civilian Migration Between Farms and Nonfarm Areas, Dec. 1941 to March 1945 (Data based on a small sample)

ltem	From	From	Net loss
	farm to	nonfarm	to farm
	nonfarm	to farm	areas
Total farm-nonfarm migrants (all ages) Farm-nonfarm migrants 14 years old and over Farm-nonfarm migration involving movement—	5,440,000	2,510,000	2,930,000
	4,160,000	1,890,000	2,270,000
Between states	760,000	350,000	410,000
	920,000	510,000	410,000
	2,480,000	1,030,000	1,450,000

Because of the demand for workers in war production centres, the rate of migration from farms was much greater during this period than in normal times, though there had been for many years a continued and fairly extensive migration from farms to urban areas. The net loss through the movement of civilians from farms averaged around 900,000 a year in the period from 1941 to 1945, which may be compared with an average of 375,000 per year during the depression decade of the 1930s, and 630,000 per year during the 1920s.

This wartime migration to and from farms was largely a short-distance movement between a city or town and its surrounding rural areas. Of the 4,160,000 persons 14 years old and over who left the farm population, 2,480,000 moved from farm to nonfarm areas within the same county; 920,000 moved to a different county within the state; and only 760,000 moved from a farm in one state to a nonfarm area in another state. The reverse movement from nonfarm areas to farms was distributed in somewhat similar fashion.

Educational Attainment.—A new measure of the educational attainment of the population is represented by the data on last (or highest) full grade of school completed, or, to use a somewhat more convenient expression, the

number of years of school completed. The question on number of years of school completed was included in the 1940 census in place of the less comprehensive questions on illiteracy asked in previous censuses. The data for persons 25 years old and over, a group made up mainly of persons whose formal education had been completed, are summarized in Table

XXIII for the United States, and for its urban and rural areas.

Of the whole number of these persons, 2,799,923, or 3.7%, had never completed so much as one year of formal schooling, and an additional 9.8% had completed less than five years; 25,897,953, or 34.6% had completed the seventh or eighth grade; 10,551,680, or 14.1%, had completed four years of high school, and an additional 15.0% had had one, two or three years of high school; 3,407,331, or 4.6%, had completed four years (or more) in college, and an additional 5.4% had had one, two or three years of college.

Figures representing the median number of years of school completed are presented in Table XXIII. The median, as defined above in connection with the age classification, is that value in a series of values arranged in ascending or descending order, which stands in the middle of the series, so that one-half of the items are greater than the median and one-half less. In order to understand clearly the relation between the medians and the frequency distribution presented in the table, it is necessary to keep in mind the fact that the distribution is in terms of completed years, while the medians are expressed in decimals representing tenths of a year. For example, the number of persons shown as having completed eight years of school includes not only those who had completed exactly eight years but also all those who had completed in addition any fraction of a year. In other words, the range of the group is from 8 to 8.9 years. A median of 8.4, then, does not indicate a point beyond the limits of the eight-year group but rather a position within that group.

The median number of years of school completed by all persons 25 years old and over in the United States in 1940 was 8.4. Because of the more favourable educational opportunities in urban areas, the median number of years of school completed was decidedly higher for the urban population 25 years old and over than for either of the rural groups, being 8.7 for the urban, as compared with 8.4 for the rural-nonfarm or village population and only 7.7 for the rural-farm. There were similar differentials as between one and another of the race-nativity classes, the medians ranging from 8.8 for the native whites to 5.7 for the Negroes—or combining the two classifications, from 9.6 for the urban native whites to 4.1 for the rural-farm Negroes.

Marital Status.—World War II produced a remarkable increase in the percentage of men and women who were married, according to a sample survey completed in Feb. 1944. The increase resulted mainly from the large numbers of war marriages among young people, but all age groups of the population contributed somewhat to the upward matrimonial trend. The proportion of married persons in the population was higher in 1944 than at any

previous time for which statistics were available.

In Feb. 1944 there were 32,850,000 married women in the United States, representing nearly 63% of the female population 14 years old and over, as shown in Table XXIV. In 1940, the decennial census showed that only 30,090,488, or 60% of the female population 14 years old and over, were married. The unusual character of this increase is shown by the fact that in the decades 1930-40 and 1920-30 the percentage of

women married changed by only a fraction of 1%. The increase in 1940 was without doubt attributable mainly to the psychological effects of war conditions and to a new sense of economic security resulting from full employment and high wartime wages.

Among civilian men, the proportion married was even larger than among women because a large percentage of the unmarried men were in the armed forces in 1944. Of the males 14 years old and over who were civilians in 1944, 72% were married. The combined effect of inductions and the increase in marriages is shown by the figures for men 20 to 34 years old. In Feb. 1944, there were only 1,700,000 civilian bachelors in this age group, as compared with 7,100,000 single men in 1940. The induction of young men into the armed forces, at least up to 1944, had not discouraged young people from marrying.

The greatest increase in the proportion of the female population married occurred among women in their early twenties. In Feb. 1944, nearly six-tenths of the civilian women 20 to 24 years old were married, as compared with five-tenths in 1940. A marked increase also occurred among women 25 to 34, though the change was less evident among older women. The extent to which war conditions necessitated temporary separation of married couples is shown by the figures for married women classified according to whether their husbands were present (that is, were living in the same household) at the time of the survey. There were more than 2,700,000 married women whose husbands were absent in the armed forces in 1944, representing about 8% of the total number of civilian married women. In the age group 20 to 24 years, nearly 30% of the married women were wives of absent servicemen. The number of married women with husbands absent otherwise than in the armed forces in 1944 was 1,460,000-not far different from the whole number of married women with husbands absent as returned in the census of 1940. (See also Marriage and Divorce.)

Fertility.—One of the new features of the reports of the 1940 census of population comprised two elaborate tabulations of data on fertility. One of these tabulations was based on the number of children ever born, as reported for each woman in 1940, and the second was based on the number of children under five years of age, as returned in the regular enumeration of the population. Parallel tabulations were made from the schedules of the 1910 census in order to provide significant comparisons for dates about a generation apart. A summary of the data for native white women either married, widowed or divorced at the time of the census (often referred to as "ever-married" women) is presented in Table XXV.

	6,522,822	15,574	88,519	427,065	786,759	2,604,976	2,599,929			

Two significant comparisons may be made on the basis of the ratios between the number of children and the number of women; first, as between the two census years represented, it may be noted that the number of children per 1,000 women was very much smaller in 1940 than in 1910—428 as against 651 for all native white "ever-married" women 15 to 49 years of age. Similar differences are shown for women of the various age groups making up this total, the decrease in the ratio being somewhat larger for the older women in the group.

Another significant comparison is that between the figures for urban and rural areas. The number of children per 1,000 women in urban areas in 1940 was only 351, as compared with 584 for rural-farm areas and 489 for rural-nonfarm. The decrease between 1910 and 1940 in these areas was approximately the same as that already indicated for the total, namely, a decline of 30% or 35% in the number of children per 1,000 women during the intervening 30 years.

On the basis mainly of the returns for the number of women of child-bearing age and the number of their children under 5 years old, it was figured out that if the birth and death rates of the period 1935-40 were to continue indefinitely, there would be 978 daughters born per generation for every 1,000 women born during the preceding generation. The figure 978 is termed the net reproduction rate. The corresponding net reproduction rate for the period 1905-10 was 1,336. This rate is a useful device for summarizing in a single figure the prospects of immediate future population growth in a country or section or a class of the population. A net reproduction rate of 1,000 would indicate that each generation would just replace itself under the stated conditions. A lower rate implies a declining population and a higher rate a potentially gaining population. Net reproduction rates for the urban and rural population, by regions, for five-year periods ending in 1940 and 1910, are presented in Table XXVI. If a rate were computed for 1945 it would be appreciably above 1,000, by reason of increases in the birth rate, though it was not expected in late 1946 that this higher level would be maintained for a very long period.

These figures indicate in more dramatic fashion than the percentages of Table XXV the marked decline in fertility rates between 1910 and 1940 and the difference on either date between urban and rural areas. They indicate that even in 1910 the urban population was not quite reproducing itself, while the rural-farm areas still had, even in 1940, a considerable excess capacity for population increase. It is evident from these figures that the

*The new series figures represent the results of an improved technique of enumeration which gave a slightly larger labour force the additions being mainly women; adjusted data for the earlier dates were being prepared in 1946.

rapid growth of the urban population had depended on an extensive in-migration from rural areas; and it was equally evident, from a study of economic developments in the farming areas, that these latter had had a surplus of sons and daughters whom they did not need for the maintenance of agricultural production-and that the occupational opportunities offered these boys and girls in the industrial centres constituted a real benefit to the rural areas.

The rates shown for the four geographic regions indicate variation in fertility on a different basis. For the south alone, among the four regions, the 1940 net reproduction rate of 1,182 indicates a potentially increasing population, while the very low rate of 794 for the north-eastern states indicates a population far short of maintaining its own numbers. (See also Birth Statistics.)

Employment and Labour Force.-On the basis of data obtained each month from a representative sample of 25,000 or 30,000 households, monthly estimates were published beginning in March 1940, giving the number of persons in the civilian labour force, the number employed (with separate figures for those in agricultural and those in nonagricultural occupations) and the number unemployed. These figures are summarized for the month of July, from 1940 to 1946, in Table XXVII. The month of July, it may be noted, represents the peak in the seasonal variation in the number of persons in the labour force, it being a month of active employment in agriculture and also a month in which many young persons were working during school vacation.

The effects of the induction of men into military service, and the effects of their partial replacement by women, are clearly in-

dicated by the figures shown for the civilian labour force. The number of males in the civilian labour force in July 1940 was 42,570,000; this number had declined by July 1945 to 34,950,000, but then increased, with the return of millions of service men to civilian life, to 43,000,000 in July 1946.

The number of females in the labour force, on the other hand, increased from 13,850,000 in July 1940 to a maximum of 19,110,000 in July 1944, with a slight decrease recorded in July 1945, and a decided decrease to 17,400,000, in July 1946. (The actual decrease in the number of women in the labour market between 1944 and 1946 was even more than the difference between these two figures would indicate, since the 1946 figure represented the results of a new enumerative technique which brought more than 1,000,000 additional women into the labour force classification.)

The gradual disappearance of unemployment is likewise indicated by these representative monthly figures. In July 1940, 14.9% of the labour force was unemployed (including those on emergency work); by July 1941 this percentage had been reduced to 9.3; by July 1942 to 4.3; and by July 1944 to 1.8, which last figure may be assumed to represent approximately the minimum number of persons who would in July of any year be in process of passing from one job to another—so-called "frictional" unemployment.

During the next year, with the return of millions of veterans from overseas and their placement in civilian employment, the number of unemployed, that is, the number of persons actually seeking work, increased materially to a total of 2,270,000, or 3.8% of the labour force, in July 1946. This figure, it may be noted, was far short of the amount of unemployment which was forecast at the close of hostilities by those looking forward to the end of the first postwar year. Practically all of the increase in unemployment took place in the male labour force, where the number increased from 480,000, or 1.4% in July 1945 to 1,760,000, or 4.1% in July 1946, while the increase in female unemployment was only from 470,000 to 510,000.

The number of persons employed in agriculture declined from 10,660,000 in July 1940 to 9,140,000 in July 1945. This net loss of 1,520,000 resulted from a decline of 2,380,000 in the number of males employed in agriculture, partly offset by an increase of 860,000 in the number of females so employed. By the end of the first postwar year, in July 1946 the number of males employed in agriculture had increased by around 600,000 to 7,780,000, and the number of females had declined materially.

The number of persons employed in nonagricultural occupations increased from 37,350,000 in July 1940, to a wartime maximum of 45,050,000 in 1943 and stood at 43,-

520,000 in July 1945. With the return of men from military service, however, the number of nonagricultural workers increased to 48,190,000 in July 1946. The number of females employed in nonagricultural occupations was 10,080,000 in July 1940, and 16,170,000 in 1945, the increase in this number thus accounting for practically all of the increase in the whole

number of nonagricultural workers. Between 1945 and 1946, however, the number of female workers in nonagricultural occupations decreased by more than 2,000,000, this figure being made up largely by housewives who were withdrawing from gainful activity undertaken under stress of wartime demands.

Later changes in employment and the labour force, including the seasonal fluctuations, are indicated by the figures in Table XXVIII, which presents data month by month from July 1945 to Aug. 1946. The first column of this table provides a measure of the civilian labour force, declining in the first few months of the period, partly as a result of the decline in war activity and partly because of the normal seasonal change from midsummer to midwinter, and then picking up rapidly in the second half of the period, with the return of servicemen, the reconversion of industry to peacetime production, and the upward seasonal trend between winter and summer.

The changes in the number of employed persons ran closely parallel with the changes in the total labour force, since the increases in unemployment were at no time spectacular. The maximum number of unemployed males, 2,200,000, was recorded in March 1946, followed by a decline to 1,580,000 in August. The number of unemployed females remained close to 500,000 throughout the period, while the number of employed females decreased from 19,610,000 in July 1945 to 16,710,000 in Aug. 1946, mainly because of the withdrawals from industrial activity already mentioned. (See also Employment.)

Wage or Salary Income.—The 1940 population census included two questions on income which applied to all persons 14 years old and over except inmates of specified institutions. The main question called for the amount of money wage or salary income received in 1939. This was supplemented by a second question which asked whether or not income amounting to \$50 or more was received in 1939 from sources other than money wages or salaries. The purpose of the second question was to identify for separate tabulation those for whom wages or salaries constituted practically the entire income.

The income question was limited to wages and salaries in order to simplify the work of the enumerator, it being assumed that the information could be obtained much more readily than information on farm income, business profits, or receipts from other sources.

Wage or salary income was defined as including all money received in compensation for work or services performed as an employee, including commissions, tips, piecerate payments, bonuses, etc., as well as those receipts commonly referred to as wages or salaries. The value of income received in kind, such as living quarters, meals, clothing, etc., was not included.

The most significant of the returns from the income questions were those relating to persons classified as wage

or salary workers, omitting those on public emergency work. Income data for this class, which formed nearly three-fourths of the entire labour force, are presented in Table XXIX. Wage or salary workers were defined as persons who in their current or last job worked as employees for wages or salaries.

About two-fifths of the workers who reported the receipt of no money wage or salary income in 1939 were persons who reported the receipt of other income and thus might have received all their income in 1939 from farming or other own-account activities, and the remainder were for the most part persons who were unemployed or outside the labour force in 1939.

The considerable range of income was indicated by the fact that about one-fourth (30.8% of the males

and 8.8% of the females) reported incomes of \$1,400 or more and a little more than one-fourth (23.5% of the males and 40.5% of the females) reported incomes below \$400. Those who received \$5,000 and over constituted 1.0% of the total and those with from \$1 to \$99, 3.4%.

In the group of workers without other income of \$50 or more, the median wage or salary income of those workers who received \$1 or more in 1939 was \$1,046 for men and \$621 for women. These figures apply to all wage or salary workers without regard to occupation or amount of time worked, so they can not by any means be used as an indication of differences in pay scales for men and women doing the same work.

Those persons who were wage or salary workers in March 1940, but who reported that they received no wage income in 1939 and who were for this reason omitted in the computation of the medians quoted above, were largely persons who did not begin work until 1940 or who were unemployed or working on their own account (not for wages or salary) during the whole of 1939.

The median wage or salary income of male workers who did have income from nonwage sources amounting to \$50 or more was \$972, and for female workers, \$516, these figures being materially less than the median incomes of those for whom wages or salary constituted practically the entire income. For persons at the lower end of the wage or salary income scale, nonwage income, consisted primarily of direct relief payments and of income in kind, such as food, clothing and lodging, whereas for persons at the upper end of the scale it consisted mainly of rents, interest, dividends and profits. (See also Wages and Hours.)

Families.—A family, as the term is ordinarily used in the census reports, comprises a family head and all other persons in the home related to the head by blood, marriage or adoption. A person living alone is counted as a oneperson family.

*Includes workers not reporting whether or not they received other income of \$50 or more—about 800,000 in all.

The number of families in the United States in 1940 was 35,087,440. This number included 26,605,800 "normal" families (families having as head a married man, wife present); 3,128,400 other families with a male head and 5,353,240 families with a female head. In 1945, according to a survey completed in May, there were 37,450,000 families, or about 2,363,000 more than in 1940. The number of normal families was practically the same; the number of other families with a male head had decreased to 2,630,000; while the number of families with a female head had increased to 8,200,000, or nearly 2,850,000 more than in 1940. Since this increase was approximately the same as the number of married women with husband in the armed forces, it may be assumed that the group was made up largely of families in which the wives of servicemen assumed responsibility for the home (see Table XXX).

Table XXX.—Number of Families in the United States, by Marital Status and Sex of Head, 1945 and 1940 (The figures for 1945 are estimates based on a small sample)

Sex and marital	Number o	of families	Per cent of `	Per cent of total		
status of head	May 1945	April 1940	increase	1945	1940	
All families	37,450,000	35,087,440	6.7	100.0	100.0	
Male head	29,250,000	29,734,200	-1.6	78.1	84.7	
Married, wife present	26,620,000	26,605,800	0.1	71.1	75.8	
Other marital status .	2,630,000	3,128,400	-15.9	7.0	8.9	
Female head	8.200.000	5.353.240	53.2	21.9	15.3	

The changes in the distribution of families by size between 1940 and 1945 are indicated by the figures in Table XXXI. The average number of persons per family was only 3.21 in 1945, as compared with 3.52 in 1940, the decrease resulting in large part from the absence of one-time family members in military service in 1945, though in accordance with a long-time trend the average size of family in the United States had been decreasing at the rate of about two-tenths of a person in each decade. There were more 2-person families in the United States than families of any other size both in 1945 and in 1940 although the percentage of such families in the total had

increased in the 5-year period from 25.7% to 29.2%. The percentage of 1-person families likewise increased materially, while the number of families comprising 5 or more persons decreased by 17.4%.

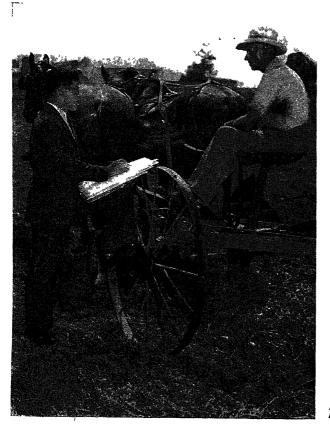

Table XXXI.—Number of Families in the United States, by Size, 1945 and 1940 (The figures for 1945 are estimates based on a small sample)

	Number of families		Per cent of	Per cent of total			
Size of family	May 1945	April 1940	increase	1945	1940		
_ All families		35,087,440	6.7	100.0	100.0

Six persons	1,850,000	2,171,540	-14.8	4.9	6.2		
Seven or more persons .	1,870,000	2,782,700	-32.8	5.0	7.9		

Housing Data.—The number of occupied dwelling units in the United States increased from 34,855,000 in 1940 to 37,600,000 in Nov. 1945, the increase amounting to 2,745,000. Urban dwelling units alone increased by 3,151,000, or more than the increase in the total, this figure being partly offset by a decrease of 788,000 in rural-farm dwelling units, while rural-nonfarm units showed a moderate increase of 382,000.

Tenure.—One of the most significant changes in the characteristics of dwelling units between these two dates was the marked increase in the percentage of units occupied by their owners. There was a decrease of 2,068,000 in the number of tenant-occupied units, and an increase of 4,813,000 in owner-occupied units, this change resulting in part without doubt from the regulations with respect to the amount of rent that might be charged. The percentage owner-occupied for all dwelling units thus increased from 43.6% in 1940 to 53.2% in 1945.

Rural visit by a U.S. census taker in connection with the 16th decennial census of 1940

For dwelling units in urban areas the increase was from 37.5% to 46.5%; in rural-nonfarm areas from 51.7% to 64.1%; in rural-farm areas from 53.2% to 65.4%—though in this last case, by reason of the very considerable decrease in the whole number of occupied units, the 1945 percentage applied to a different and appreciably smaller base. The data on dwelling units by tenure are summarized in Table XXXII.

Table XXXII.—Occupied Dwelling Units in the United States by Tenure, 1945 and 1940

(Data for 1945 based on a small sample.

Value and Monthly Rent.—In the 1940 census, the enumerator was instructed to obtain for each owner-occupied dwelling unit the estimated current market value of the home, and for each tenant-occupied unit, the monthly rent, or, if no rent was actually paid, the estimated monthly rental value. The numbers of dwelling units in the United States classified on the basis of these returns are presented in Table XXXIII, with medians, averages and percentages for rural and urban areas. The medians are in all cases materially lower than the averages, since the latter are pushed upward by the weight of small numbers of homes with very high values, while in the computation of the median a home valued at \$20,000 or more has no more weight than one valued at \$200.

In the United States as a whole, the owner-occupied dwelling units were rather widely distributed on the basis

of value, all of the groups shown in the table with values up to \$7,500 being represented by approximately 5% or more of the total, the maximum group, that comprising homes valued from \$3,000 to \$3,999 containing only 13.3%. This even distribution disappears, however, when the total is subdivided into geographic areas. In fact, the subdivision of the United States into urban and rural areas covering the country as a whole results in an urban series with relatively few dwelling units valued at less than \$1,000 and appreciable numbers more than \$10,000, while in the rural-farm area almost half of the owner-occupied units were returned with a value of less than \$1,000 and two-thirds with a value of less than \$1,500. These urbanrural differentials are brought out more clearly, perhaps, by the median values, which were \$3,501 for the urban, \$1,715 for the rural-nonfarm, and \$1,028 for the rural-farm.

The range covered by the tenant-occupied dwelling units classified by rent was somewhat narrower, 60% of these units falling between \$10 and \$39 in monthly rental. Concentration in this range was especially characteristic of the urban units. The rural-nonfarm units showed a similar concentration in the rental groups from \$3 to \$20, and the rural-farm units at an even lower level. The variations in monthly rental as between urban and rural areas were decidedly greater than the corresponding variations in value, the median monthly rental for urban dwelling units being \$24.60, for rural-nonfarm units, \$10.08, and for rural-farm, \$4.72.

On the basis of the classifications presented above, the total values of all dwelling units (including tenant-occupied) and total monthly rent (including estimated rent for owner-occupied units) were computed. A summary of these estimates is presented in Table XXXIV.

The total value of all dwelling units in the United States on the basis of these estimates was more than \$95,000,000,000, and the average value per unit was \$2,557. In making these estimates, it was assumed that the value of the tenant-occupied and vacant units was 100 times the monthly rent.

The actual or estimated monthly rental value of all dwelling units in the United States in 1940 was nearly \$894,000,000, or an average of \$23.94 per unit. The annual total on this basis was something more than \$10,000,000,000. These figures are based on actual rentals reported for tenant-occupied nonfarm dwelling units, reported estimated rental values for all other dwelling units except owner-occupied farm homes, and monthly rentals for these latter estimated at the rate of 1% of the reported value.

The average value of urban dwelling units was \$3,290, as compared with \$1,055 for rural-farm units. The relation between urban and rural-farm rentals was practically the same. The average value of all dwelling units in the northeastern states was \$3,605, of those in the north central states \$2,540, of those in the south \$1,574, and of those in the west \$2,573, again with similar relations among the average monthly rentals.

In Table XXXV, dwelling units occupied by tenants in urban and rural-nonfarm areas are classified by monthly rent as reported in 1945 and 1940. The median monthly rental of rented urban units increased from \$24.60 in 1940 to \$30.25 in 1945, the corresponding increase for units in rural-nonfarm areas being from \$10.08 to \$15.50. In the matter of distribution, these increases obviously resulted from a marked decline in the number of urban units renting for amounts less than \$25, and a marked increase in the numbers of those renting for more than \$30. In rural-nonfarm areas, the numbers of units renting for less than \$15 decreased very sharply, while the numbers renting for \$25 or more showed very large increases, amounting in the case of those with rentals between \$30 and \$50 to more than 100%. These figures are summarized in Table XXXV.

Table XXXV.—Tenant-Occupied Dwelling Units in Urban and Rural-Nonfarm Areas by Contract Monthly Rent, 1945 and 1940 he 1945 figures are based on a small sample; 1940 figures include an estimate

Plumbing Equipment.—Of the 37,600,000 occupied dwelling units in 1945, 24,385,000, or 64.9%, had a private bath and a private flush toilet, as compared with 55.7% having the same facilities in 1940. An additional 4.1% of the 1945 total had a flush toilet but no private bath, as compared with 4.3% in this group in 1940. Of the units lacking both these facilities, 3,622,000 had running water in the dwelling unit, leaving 8,057,000 without even this convenience. This last group, which was mainly rural, decreased 22.0% during the five-year period, and comprised only 21.4% of the total in 1945, as compared with 29.6% in 1940. The changes from 1940 to 1945 in urban, rural-nonfarm, and rural-farm units were all in the same direction, though at decidedly different levels. For example, 81.5% of the urban units had private bath and flush toilet (increase from 76.9%) as compared with 53.5%

of the rural-nonfarm (increase from 39.5%) and only 15.9% of the rural-farm units (increase from 10.9%). Conversely, the percentage of urban units without running water in 1945 was only 5.3% (decrease from 6.5%) as compared with 71.9% of the

rural-farm units (decrease from 81.8%). These figures are summarized in Table XXXVI.

Heat, Light and Radio. -The percentage of the whole number of occupied dwelling units in the United States provided with central heating facilities increased from 42.0% in 1940 to 48.4% in 1945; the percentage having electric lights increased in the same period from 79.2% to 88.7%, and the percentage having a radio from 82.8% to 90.4%. In the matter of central heat, the percentage reported for

urban units was far higher than that for rural-farm-61.2% as compared with 15.4%. In the matter of electric lights there were likewise material differences, although more than one-half of the rural-farm units reported electric lights in 1945 (52.4% in 1945 as compared with 32.3% in 1940). In the matter of radios, 76.6% of the rural-farm homes reported such equipment, as compared with 94.4% of the urban homes. These figures are summarized in Table XXXVII.

Sixteenth Census Reports.-The major part of the material from the 1940 census was published in eight volumes, most of the volumes containing several parts. Each volume was made up by consolidating a series of state bulletins (in which form the data were first made public), including in each case a summary for the United States. There are four volumes presenting data specifically on population and four volumes presenting data on housing. In addition, there are available 30-odd supplementary reports, for the most part based on sample tabulations, covering subjects as follows:

Institutional population.

Internal migration 1935-40 (four reports) giving statistics on colour and sex of migrants, economic characteristics, age and social characteristics.

State of birth of the native population.
Nativity and parentage of the white population (three reports), including country of origin of the foreign stock, and mother tongue of the entire population.

Characteristics of the nonwhite population by race.

Differential fertility (four reports) presenting data for states and large cities, standardized fertility rates and reproduc-

tion rates, children ever born and children under five years old.

Educational attainment of children by rental value of home. The labour force (seven reports), presenting detailed tabulations by occupation, industry, income, personal and

Central America

Defined geographically, Central America includes the six republics of Guatemala, El Salvador, Honduras, Nicaragua, Costa Rica, and Panamá and in addition the British crown colony of British Honduras (or Belize) and the Panama Canal Zone. Area, approximately 227,500 sq.mi.; pop. approximately 9,045,000.

The whole Central American area, with the conspicuous exception of British Honduras, of course, continued to be greatly subject to political and economic influence from the United States, during the decade 1937-46, primarily because of the fact that Panamá and Nicaragua presented the two most feasible routes for construction of an interoceanic canal, a project in which the U.S. had been interested from early in the 19th century. Even in later years, U.S. economic influence as measured in terms of trade and investments, though dominant in Central America, was not as important as the historic political interest of the U.S. in that area would lead one to assume. Central America, along with the republics of the Caribbean, was the scene of the earlier U.S. experiments with protectorates, both Nicaragua and Panamá having been commonly classed as such at one stage by most authorities.

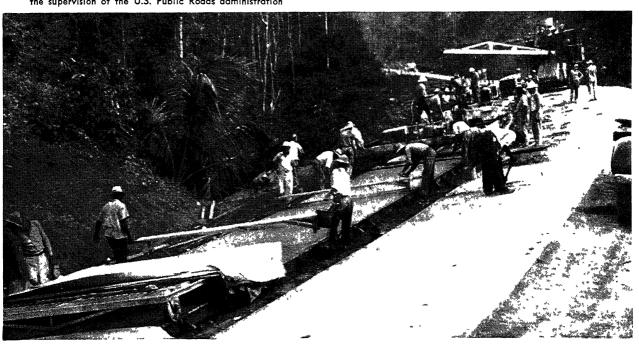

The inauguration of the "Good Neighbour policy" in the 1930s, while it did not lessen the amount of U.S. influence in Central America, clothed it in more acceptable form and hence the later relationships of the independent units in that area with the U.S. were significantly different from what they were a generation earlier. The beginning of 1937 found strong dictators in power in four of the Central American republics—Gen. Jorge Ubico in Guatemala; Gen. Maximiliano Hernández Martínez in El Salvador; Gen. Tiburcio Carías Andino in Honduras and Gen. Anastasio Somoza in Nicaragua. The U.S. maintained friendly diplomatic relations with all of them despite uncrystallized criticism of such a relationship from various democratic elements in the different dictatorships. While the several dictators remained in power, the period was one of nationalism, although the four dictators worked harmoniously together in suppressing revolutionary movements.

The outbreak of World War II in Sept. 1939 brought serious economic problems to all of Central America, largely because the monoculture character of its economy and its essentially colonial economic development made it dependent on foreign trade in great measure and hence vulnerable in the face of deep dislocation of that trade. The quick diversion of shipping to more immediately pressing wartime needs, in addition to the submarine menace which soon began to affect the Caribbean sea lanes, promptly cut into the shipping available for transportation of Central American commerce, a very large part of which was water-borne. Honduras, with bananas as its traditional important export product, was especially hard hit. Guatemala and El Salvador had inadequate rail links with the countries to the north, but otherwise railway and even highway connections were almost entirely lacking.

Panamá was host to the first conference of foreign ministers or their representatives, held at Panamá city Sept. 23-Oct. 3, 1939. All of the Central American republics (but not British Honduras or the Panama Canal Zone) were represented at the conference and took an active part in it despite thinly veiled threats previously made by the German minister to the Central American states. All of the Central American republics declared their neutrality at the outbreak of the war but co-operated closely with the U.S. in measures designed to protect the hemisphere and preserve its neutrality. Panamá became the spokesman

Highway across the isthmus of Panama, completed in 1942 under the supervision of the U.S. Public Roads administration and clearing house for all republics of the hemisphere in conducting correspondence with regard to the "neutrality zone" established around North and South America south of Canada by action of the first foreign ministers' conference.

All units of the area were concerned in the early stages of the war as well as later with the suppression of fifthcolumn and espionage activities. This concern was naturally greatest in Panamá and the Canal Zone, where very stringent precautions were taken from the outbreak of the war. Each of the republics had small but usually active and well-organized axis minorities; these were estimated as follows: Guatemala, 1,500 Germans plus 2,200 nationals of German descent and 420 Italians; El Salvador, 1,175 Germans plus 2,200 nationals of German descent, 625 Italians plus 4,400 nationals of Italian descent and 25 Japanese; Honduras, 440 Germans plus 510 nationals of German descent, 200 Italians and 5 Japanese; Nicaragua, 150 Germans, 65 Italians and "a few" Japanese; Costa Rica, 1,000 Germans plus 3,500 nationals of German descent, 700 Italians and 40 Japanese; Panamá, 175 Germans plus 1,000 nationals of German descent, 600 Italians plus 750 nationals of Italian descent and 400 Japanese. "Spy scares" were frequent in the early months of World War II, and definite activity was conclusively proved in Panamá, British Honduras and elsewhere. The German minister to Central America again attempted interference with the diplomatic freedom of those republics prior to the second foreign ministers' conference at Havana, Cuba, in July 1940, but without success. The chief question up for consideration at that conference was the possible disposition of European possessions in the Caribbean area in case nazi Germany should attempt to assume control of French, Dutch and possibly British colonies. With about a dozen European colonies situated within a few hundred miles of Central America, and British Honduras as a direct part of it immediately adjoining Guatemala, the problem was naturally of great concern to Central America. The several republics joined wholeheartedly in working out the formula at Havana for "provisional ad-

ministration," though Guatemala, because of a long-standing boundary controversy with British Honduras, made a reservation with regard to the applicability of the plan to that colony.

The economic pinch of trade disruption was keenly felt by 1940, but the Inter-American Coffee Quota agreement of Nov. 1940, with its promise of coffee price stabilization, and financial aid from the U.S. materially lessened the economic strain. The basic production quotas allotted the five Central American republics (Panamá was not a party to the agreement) were as follows: Guatemala, 535,000 bags of 60 kg.; El Salvador, 600,000 bags; Honduras, 20,000 bags; Nicaragua, 195,000 bags; Costa Rica 200,000 bags; actual production and allowed exports practically always exceeded those figures, however.

The Japanese attack on Pearl Harbor brought very prompt response from the Central American states; all of them had declared war upon all major axis states by Dec. 13, 1941, and Costa Rica's declaration of war upon Japan actually preceded that of the U.S. by a few hours. The situation was strikingly in contrast with that in 1917-18, when five of the republics (El Salvador excepted) declared war upon Germany but, except for Panamá, only after delays of from 12 to 15 months after the U.S. took the action. Most observers were inclined to credit the prompt action in 1941 as political dividends paid by the Good Neighbour policy. Political opponents of the various dictators were disposed to credit their action to realization of the opportunity for harsher and more complete domination of their respective countries under the guise of exercising emergency wartime powers.

Co-operation of the Central American governments in hemispheric defense continued unabated in 1942. They employed such methods of countering subversive activities as arrest and deportation of dangerous aliens, sequestering of enemy alien property, increase and better equipment of their armed forces, and production of strategic materials. The U.S. and the United Nations did not at any time expect or ask the Central American states to contribute military, naval or air contingents to participate in the fighting directly, but those states were strongly urged to increase their production of materials contributing to the war effort. The United Fruit company, in conjunction with the U.S. Board of Economic Warfare, speeded plans for the cultivation of some 40,000 ac. of abacá, as a substitute for manila hemp in Costa Rica, Honduras, Guatemala and Panamá, and for rubber plantings in Honduras and Costa Rica; by 1944 abacá plantings in the four countries mentioned were reported to have reached 26,000 ac. The Rubber Development corporation (a U.S. government agency) in several cases contracted for the entire national output of Central American states through 1946. Other products supplied in increasing amounts by Central America for the war effort included balsa wood, mahogany and other hardwoods, cinchona, roselle fibre, loofa sponges, balsam of Peru (found almost exclusively in El Salvador), rotenone and others.

In all of the states it proved necessary to establish governmental controls over motor vehicles, tires and fuels, and also to set price ceilings on at least some commodities, principally foodstuffs. Interference with water-borne transportation continued to be serious, especially because of the shortage of tankers, as Central American local industry and transportation depended largely on imported fuels. The disrupted shipping situation led to large-scale efforts during 1942, continued until Sept. 1943, to complete a

military highway through Central America in order to transport strategic products to Mexico, whence they might be shipped by rail to the U.S., and to carry supplies to the Panama Canal Zone and points en route. After the 1920s, the U.S. Public Roads administration, assisted by congressional appropriations for surveys and bridge building, had aided the Central American governments in construction of portions of the permanent inter-American highway to extend from the U.S. border to the Canal Zone. The military highway was designed in 1942-43 as a substitute or alternative route, ostensibly to take advantage of easier grades and better locations. With the decline in submarine sinkings in 1943, the military project was suddenly abandoned in September. As early as the closing months of that year, reports began to circulate widely of wholesale waste in construction.

A U.S. senatorial subcommittee, holding hearings at Los Angeles, Calif., on Sept. 3-4, 1946, disclosed many details of the apparent mismanagement and waste that had entered into construction of the military road. U.S. army engineers testified before the subcommittee that \$36,000,ooo was spent during the ten months of active construction work but asserted that war department indifference to their pleas for priorities for construction materials and machinery defeated the project. The ultimate cost of the military road was estimated at \$160,000,000, or more than ten times the original war department estimate. Charges made during the testimony were that the Public Roads administration and the military forces were engaged in construction of parallel roads in some places at the same time, that the roads administration in two cases made detours to bring the permanent highway to ranches owned by the presidents of Nicaragua and Costa Rica, that political and other extraneous considerations influenced the location of the highway in various places, that three bridges were built in Nicaragua on a route which was later abandoned, etc. It was asserted that, in addition to the \$36,000,000 spent by the U.S. army, the Public Roads administration had spent a total of \$57,200,000 on its route by Sept. 1946 and that \$65,000,000 additional would be necessary to complete that road.

Though the shipping situation definitely improved during the later years of World War II, shortages were still felt in Central America, both because of the lack of supply of consumer goods and the shortage of cargo space. Lack of fuel oils, gasoline and tires was estimated to have resulted in as much as a 50% decline in automotive traffic in some parts of Central America; Honduras was especially affected. Employment was stimulated by new wartime agricultural projects, highway construction (until autumn), and the recruiting of labourers from several Central American republics for large-scale construction projects in the Canal Zone. The T.A.C.A. air line (Transportes Aéreos de Centro América), one of the pioneer aviation companies in Central America with headquarters at Tegucigalpa, Honduras, was purchased by U.S. capital during 1943.

Central European and Balkan Literature

Under this heading are grouped the literatures of the countries of Europe's middle zone, extending from the Baltic to the Adriatic and from the Alps to the Black sea.

Stefan Zweig, whose autobiography, The World of Yesterday, was published in 1943, a year after the exiled Austrian novelist died in South America as a suicide

Austria.—Nazi doctrines and tyranny did not succeed in suppressing Austrian literature or diverting it from its traditional sources of beauty and musical inspiration. On the contrary, the terrible events of 1938–45 produced a remarkable harvest of dramatic works, poems, novels and essays which reflected the deepened love of the Austrian poets for their country. This was movingly expressed in many works both of writers who went into exile and those who could not or would not leave their country. Some writers could not, unfortunately, resist the influence of nazi doctrine or the honours offered them under Adolf Hitler's rule, among them the highly gifted poet Josef Weinheber. When the nazi regime collapsed, he and several others committed suicide.

Many of the most beautiful poems and the finest novels of this period were written by women, and writers originating from the Austrian Alpine provinces successfully challenged the former literary pre-eminence of Vienna. Their style was distinguished by its austerity, virility and precision. Only a few of the prominent writers and their works can be mentioned here. Among the plays, Max Mell's Nibelungs was perhaps the most remarkable. In Franz Csokor's Calypso and The Lost Son, the Odyssean wanderings of the author and the tragedy of the "partisan" were masterly rendered. Franz Werfel's Jacobowsky and the Colonel was a penetrating condemnation of racial discrimination and nazi barbarism. Hans Weigel's and Ferdinand Bruckner's works showed great talent and mastery of characterization. The works of the lyric poets included Knight, Death and Devil by Paula Preradović, who was imprisoned; The Titans, by Alexander Lernet-Holenia, a collection of poems of great beauty; and equally fine collections of poems by Felix Braun and by Kaethe Braun-Prager. Among the novels, Erika Mitterer's The Prince of the World, Paula Preradović's Pavi and Pero and Franz Werfel's Song of Bernadette were outstanding; among the essays Rudolf Kassner's Transfiguration, Werfel's Utopian Between Heaven and Earth and Raoul Auernheimer's Grillparzer should be mentioned as well as Stefan Zweig's autobiography, The World of Yesterday.

Bulgaria.—Ever since its beginnings during the struggles for liberation from the Turks in the 19th century, Bulgarian literature had borne the signs of a society in transition. These signs were even more evident during the years 1937–46, when Bulgarian writers, facing a world in turmoil abroad and sharp social conflict at home, did not remain detached observers and recorders of events. They took sides with the conviction that the historical moment called for active spiritual leadership. Where they took inspiration from foreign literature, the majority of them looked to H. G. Wells, George Bernard Shaw, J. B. Priest-

ley, Upton Sinclair and Ernest Hemingway rather than to John Galsworthy, Sir James M. Barrie or Somerset Maugham. They believed in realism, awareness of the social conflict and active participation in it. During the years of German domination over Europe, some writers allowed the nazi doctrine to influence their work, but the majority retained their independent spirit. Many joined the underground movement and the war for liberation against the Germans. Some, like N. Yonkov, gave their lives in the struggle. Others survived, and their writings came to reflect all the rousing, impulsive and often rough ways of a revolutionary period. After the liberation, the Writers' union, under its president L. Stoyanov, struck off the names of 29 writers who had shown fascist tendencies and elected 85 new members. Among successful authors who wrote books during the decade were L. Stoyanov, K. Petkanov, G. Raitchev, A. Karalyitchev, Sv. Minkov, G. Karaslavov, G. Belev, D. Gabe, O. Vassilev, M. Grubeshlieva, N. Hrelkov, Lamar. In the field of lyrical verse K. Christov and E. Bagriana kept their prominent posi-

Czechoslovakia. - Czechoslovak literature during the years 1937-46 again produced a phenomenon frequently recorded throughout the history of the Czechoslovak people, viz., that at the most critical junctures in the history of the nation the Czech or Slovak authors undertake the task of moral leadership. Several years before the Munich catastrophe, the works of Czech and Slovak authors showed already a strengthening of the national consciousness. Then, the tragic year of Munich produced a whole series of works pervaded by a new kind of nationalism, a nationalism not directed against other nations, but prompted by the instinct of self-preservation and inspired by the age-old springs of the democratic tradition. The last two dramas of Karel Capek, the greatest Czech playwright, The White Plague and The Mother, were the highest expression of these two tendencies: healthy nationalism and democratic humanism.

During the German occupation the authors who remained in the country had to choose between silence and allegorical writing. While a number of the leading poets and prose writers preferred silence and did not publish the works which they had produced during this period until after World War II, others, such as the prose writers Josef Kopta and Jan Drda and the poets Josef Hora and Jaroslav Seifert, chose to write what appeared to be harmless allegories meaningless to the German invaders, but full of significance to the Czech reader in whom they instilled new faith. Others, instead, turned to historical subjects which not only filled the Czech reader with national awareness and pride, but by analogies from the past provided hope for the future. The war and the German occupation, however, deprived Czechoslovak literature of several leading authors. Thus, Josef Čapek, Karel Čapek's brother and his collaborator in several works, died in a German concentration camp; Vladislav Vančura, the best of the advanced prose writers, was executed; and if the death of Karel Capek could be attributed to the Munich events, the ordeal of the German occupation undoubtedly hastened the deaths of Josef Hora and Karel Toman, two of the greatest contemporary Czech poets. At the same time, the sufferings of the war period matured several new authors. Of these, Václav Řežác and Miroslav Hanuš were perhaps the most promising of the prose writers. Among the poets should be mentioned Jiři Orten, who died tragically during the war, František Hrubin, Laco

Novomeský, Vladimir Holan and Kamil Bednář, the latter of whom, next to František Halas and Vítězslav Nezval, became foremost among the younger poetical generation. In drama, the war brought little of lasting value, but in literary criticism, the heritage of F. X. Šalda, a critic of truly universal standards, was taken over by Václav Černý. Abroad, literary work was carried on by those who had gone into temporary exile. Here should be mentioned, in particular, František Langer and Egon Hostovský. Even though these two literary groups developed in different surroundings, the spirit of them both had much in common and may perhaps best be qualified as "humanistic realism." (V. F.)

Greece.—In the early 1930s Greek literature, freed from the dominating influence of the older literatures, in particular those of the western and northern countries, had begun to deal in its own way with the problems of Greek social life. Conflicting social theories found their reflection in the writings of that period. In this respect Greek literary life showed numerous analogies with similar developments noticeable in other countries. In general, Greece's representative writers took a positive and realistic attitude toward the world around them. Thus, in the novels published during the '30s, one finds evidence of a deeper insight into Greek life than had been customary previously. The characters portrayed, though essentially national, were set into social surroundings whose problems were not altogether divorced from those of other European countries. After 1936, under the dictatorship of Gen. John Metaxas, the severe censorship imposed on literature made writers disinclined to deal with social problems and the novels of that period reverted to purely descriptive narrative, with only here and there a hint of the writer's deeper social convictions, the subjects being confined to rural life or in some cases to the introspective analysis of the individual, on somewhat Freudian lines. Greek poetry during this period was developing in another direction. In common with developments elsewhere, France in particular, it showed a marked predilection for what was called "pure poetry" and, seeking new methods of expression, abandoned the strict discipline of traditional versification. Nevertheless, the older tradition in this field was still being maintained by Greece's great poet, Kostes Palamas, whose life work extended over half a century and who did much to introduce the culture of western Europe into his country.

During the Graeco-Italian War of 1940-41, literary activity was much reduced. Characteristic of this period was Hugelos Sikelianos' Sibylla, a tragedy in verse, which glorified Greek resistance. During the bitter period of axis occupation (1940-44) Sikelianos, who became the country's most outstanding poet, wrote songs and poems symbolic of national resistance which were circulated mainly by word of mouth. Of prose writings, few were published, most of them being historical chronicles, memoirs or descriptive novels. A tendency toward escapism was a characteristic feature of much of this writing. Nikos Kazantsakis, who, with Sikelianos, occupied the foremost position in Greek literary life, completed his epic poem The Odyssey and began to write his great tragedies by which he attempted to revive the antique drama in a new form. During the occupation years, the country lost many of its best writers and poets, among them Palamas, Ioannis Gryparis and Miltiades Malakasis.

After the liberation Greek cultural life revived. The confusion of ideas which characterized the immediate post-

war period was reflected in the fragmentary works of the resistance writers, but no great writer had yet arisen to provide a synthesis of Greek life during the terrible years of war and occupation. (E. E. Hs.)

Hungary.-The character of Hungarian literature during the years 1936-46 was determined partly by the troubled national and international background, partly by internal developments. The great generation of the Nyugat, with its conscious cult of originality and its revolt against "official" conservative standards, was slowly disappearing: G. Krudy's death in 1933 was followed by that of D. Kosztolanyi (1936), F. Karinthy (1938), M. Babits (1941), Zs. Moricz (1942), D. Szomory (1944) and D. Szabo (1945). The new writers who took their place were again ranged in two camps: the "urban" school and the "populists." The latter group, more numerous and more influential, were politically by no means homogeneous: their attitudes ranged from the fascist sympathies of Jozsef Erdelyi to the pro-soviet convictions of the Marxist Peter Veres. All writers of this school shared, however, a common faith in the peasantry as the backbone of the nation. Their collective attitude was expressed by the lyric poets Gyula Illyes and Jozsef Erdelyi; it permeated with social criticism the naturalistic novels of Janos Kodolanyi; it accounted for the work of the so-called "villageinvestigators" (Gyula Illyes, Peter Veres, Lajos Kiss, Jozsef Darvas, Zoltan Szabo, Ferenc Erdei, etc.) who revealed in their regional studies the misery of the rural poor. An interesting parallel development was the socialist activism of Lajos Kassak and Attila Jozsef who took their themes from the life of the urban proletariat. A synthesis of populist and urban tendencies was attempted by Laszlo Nemeth and by Transylvanian writers like Aron Tamasi and Jozsef Nyiro, but the gap dividing the two schools remained wide. Steeped in English and French culture, selfconscious in their artistic methods and literary style, the "urban" writers tended to feel superior to the collective school with its peasant mystique. The outstanding representatives of the urban school were Sandor Marai, Laszlo Cs. Szabo, Sandor Hunyady and Lajos Zilahy, Lorinc Szabo and Antal Szerb. The most powerful defender of European traditions was, however, Mihaly Babits.

World War II found hardly any echo in literature; there was no literary anti-Semitism and no trace of anti-Allied propaganda. The siege of Budapest created a much deeper impression, but its reflection in literature was limited to some short stories and reportage. (N. J. S.)

Poland.—Polish literature of the decade can be divided into three periods, each determined by political events.

The three years up to Sept. 1939 were a continuation of the inter-war period, which ended abruptly with the outbreak of World War II begun by the German invasion of Poland, whose cultural life suffered more heavily than that of any other European country. During this period lyrical poetry, previously marked by emotional vitality, showed an increasing tendency toward classicism. This was particularly noticeable in the mature works of Leopold Staff, even in such a primitive lyricist as Julian Tuwim among the representatives of the younger generation, but above all in the more rhetorical poetry of Antoni Słonimski. Outstanding among the younger poets was Władysław Sebyła with his penetratingly philosophic mind. The rising generation of poets was strongly influenced by Józef Czechowicz, regarded as a pioneer, although his chief appeal lay in the melody of his versification. Among the real vanguard Julian Przyboś and Tadeusz Peiper, both intellectuals and rationalists, continued to lead the way, while a note of social revolution was struck by Władysław Broniewski.

In fiction there was a noticeable turn to realism. Social interests delineated against varying backgrounds predominated. Among the most prominent representatives of this type were Juliusz Kaden-Bandrowski, a social psychologist and expressionist; Zofia Nałkowska, an intellectual experimenter; Maria Dąbrowska, who revived the traditional novel of manners; Wacław Berent, profoundly historico-philosophical in his approach; Ignacy Iwaszkiewicz, an outstanding stylist and analytical psychologist; Jan Parandowski, a master of narrative; Jan Wiktor, preeminent in his treatment of current social problems; Helena Boguszewska, with her penetrating analysis of current history; and finally Zofia Kossak, whose historical novels enjoyed great popularity. Outstanding younger writers were: Michal Rusinek, an expressionist; Zbigniew Uniłowski, a neorealist; Bruno Schulz, a surrealist; Witold Gombrowicz, who used the form of grotesque satire; Pola Gojawiczyńska, a naturalist; Michał Choromański and Maria Kuncewiczowa, both psychoanalytical in the treatment of their subject; Leon Kruczkowski, with his revised dialectical approach to historical and social themes. The social epic of the Polish village was treated by a number of writers, notably Wiktor Burek.

In dramatic art, which showed less vital impulse at that time, the following names may be mentioned: Jerzy Szaniawski, subtly psychological in his method; Jarosław Iwaszkiewicz, who excelled in characterization through dialogue; Ludwik Hieronim Morstin, a poetical aesthete; Antoni Cwojdziński, with his sparkling intellectual wit; Antoni Słonimski and Bruno Winawer, two satirists of bourgeois life; and Stanisław Ignacy Witkiewicz, an experimenter of complete originality.

The most notable literary critics and scholars were: Karol Irzykowski and Karol Ludwik Koniński, distinguished by their deep intellectual insight into the problems they presented; Tadeusz Boy-Żeleński, a satirical reformer of society and manners; Wacław Borowy, a profound cultural historian of strict aesthetic method; Karol W. Zawodziński, notable for his reviews of contemporary movements in poetry, and Leon Piwiński, for his reviews of fiction. Roman Dyboski, Andrzej Tretiak and Władysław Tarnawski were among eminent English scholars in these years; Stanisław Wędkiewicz and Mieczysław Brahmer were distinguished romance scholars and Wacław Lednicki was a brilliant authority on Russian literature.

To all appearances, cultural life ceased in Poland during the German occupation. It continued, however, in the "underground" resistance movement, though, constantly threatened by the Germans, it was of necessity conditioned by the needs of national preservation and the planning of the future. These circumstances did not favour creative literary production. The barbaric methods and highly developed technique which the Germans applied to the destruction of Polish culture caused losses which it would take years to make good. About 25% of the prewar members of the Union of Polish Writers were killed or died during the war. During the years of oppression, Polish literary activity could be found only among writers in exile, who had made their names in Poland before the war. Apart from topical themes, they contributed no new literary values.

Polish literary works were published again first in 1944 in Lublin, from which the Germans had already been driven. Four outstanding volumes of poems may be mentioned among these publications. They were by Julian Przyboś, Mieczysław Jastruń, Adam Ważyk and Jerzy Putrament, each differing in creative personality and poetic aspiration, yet all alike in their profound interest in social problems and virile will to fight for the national cause, and combining an appreciation of historical reality with a completely humanist conscience.

Among lyrical poets during the years 1945-46 one noticed, although with some exceptions, a deliberate desire to turn away from symbolism, combined with a keener sense of the social forces now at work. Of the prewar poets, Leopold Staff, Julian Tuwim, Władysław Broniewski and Antoni Słonimski were still writing. Two volumes of collected works attracted considerable attention: in his Miejsce na Ziemi (Place on the Earth) Julian Przyboś revealed a consistent poetic attitude blending an intellectually controlled feeling, permeated by a deep social consciousness. Czesław Miłosz in his Ocalenie (Salvation) touched on the contemporary experiences of the individual and mankind in general, expressed in traditional verse form, but with an enormously wide gamut of themes profound in thought and emotion. Among a host of poets the following stood out: Lucjan Szenwald, whose posthumous volume of impressions of the Polish army then being formed in the U.S.S.R. was distinguished by the melody of his richly poetic phrasing; Stanisław Ryszard Dobrowolski, by an eminently virile attitude and his challenge to the social order; Włodzimierz Słobodnik, by the touching lyricism of his reminiscences of exile in Russia; Zbigniew Bieńkowski, by an exceptionally mature debut as regards both his mastery of versification and emotional intensity.

It was understandable that literary prose in a higher degree than poetry should be affected by the impact of war and foreign occupation. Among the many authors who reached a high literary level while writing truthful reportage were: Michał Rusinek (Z Barykady w Dolinę Głodu, From the Barricades to the Valley of Hunger) and Seweryna Szmaglewska (Dymy Nad Birkenau, Smoke over Birkenau). Here too belong the writers of war stories on operations in the west, Ksawery Pruszyński (Droga Wiodła Przez Narvik, Our Way Led Through Narvik) and Arkady Fiedler (Squadron 303). As for the novel and short story form, as distinct from reportage, the following names should be recorded: Zofia Nałkowska, Helena Boguszewska, Jerzy Andrzejewski, Adolf Rudnicki, Pola Gojawiczyńska, Kazimierz Brandys, Stefan Otwinowski, Jerzy Putrament and Stanisław Piątek. The self-taught proletarian writer Jan Papuga made a fine start with his tales of the sea. Jarosław Iwaszkiewicz stood out for the quality of his prose and the high artistry of composition in his psychological narratives, embracing a great variety of human themes—as, for instance, in Nowa Miłość (New Love). Wojciech Zukrowski (Z Kraju Milczenia, From a Land of Silence), harking back to Henryk Sienkiewicz's style, proved a novelist of elemental power, with a good sense of realism and a fertile imagination. Novels of marked originality, with profound thought values, were produced by two writers; Tadeusz Breza in Mury Jerycha (The Walls of Jericho) gave a realistic portrayal of the Polish scene before the war, and Stanisław Dygat gave in Jezioro Bodeńskie (Lake Constance) an ironical analysis of wartime reality against the background of an international concentration camp on the German-Swiss frontier. Hanna Malewska and Tadeusz Hołuj wrote historical novels, while the novels of Jan Wiktor and Jalu Kurek were a blend of history and legend.

The postwar Polish novel was marked not only by the standard it reached but also by the variety and scope of its themes. The main tendency was toward an assertion of realism, whether social or humanist, or a combination of both. In literary criticism too the problem of realism was the most frequent subject. Jan Kott posed the problem most clearly in his historical meditations from Tacitus and Stendhal to Joseph Conrad and Malraux. The most interesting literary critics writing in contemporary journals included: Kazimierz Wyka, Wacław Kubacki, Andrzej Stawar, Karol W. Zawod-

ziński, Stefan Żółkiewski and, among the younger ones, Artur Sandauer and Wilhelm Mach. (K. Cz.)

Many Polish writers who escaped from German- or sovietoccupied Poland to France, Britain or the United States remained there after the liberation. At the end of 1946 the
greater number of Polish writers staying abroad were in
England. The best known were the novelist Maria Kuncewiczowa, the poets Stanisław Baliński and Marian Hemar;
Tymon Terlecki, historian of art and literature, and Zygmunt
Nowakowski, essayist. In the Paris group the most brilliant
was Zygmunt L. Zaleski, literary critic and essayist. In New
York lived Kazimierz Wierzyński, a poet who started his
literary career in the '20s by a volume on Spring and Wine
and published in 1946 a volume of his wartime verses deeply
reflecting Poland's tragedy. (X.)

Rumania.-In the interval of the two world wars, the development of Rumanian literature was so exceptional as to raise it in certain respects to an international level. On the eve of World War II two main schools predominated: the traditional school which drew its finest inspiration from indigenous sources, and the modern cosmopolitan school which stressed the necessity of a synthesis with world culture. World War II saw the dawn of one of the greatest periods in Rumanian literature. By 1940, German pressure on Rumania had become more and more insistent. Then, in June 1941, came war, forced upon Rumania by Germany. From then on Rumania experienced great suffering and humiliation. The presence on its soil of an "ally," which was in fact an implacable enemy, produced a moral conflict which reflected in its literature. The Germans tried, for their own benefit, to alter the very spirit of Rumanian culture, to cut it off from its natural sources and from its essential outside relations. Liberation in 1944 brought the end of this nightmare. One of the most important developments in 1945-46 was the cultural rapprochement with Russia.

In 1946 the great names in Rumanian literature were, however, still those which had adorned its pages after 1920. Poetry suffered the loss of Ion Pillat (1891-1945). Tudor Arghezi was still taking an enthusiastic part in contemporary literature, having lost nothing of the penetrating verve and the creative power which had made him a poet great even by world standards. Lucian Blaga continued his magnificent work as metaphysician and poet; during 1937-46 he published his Trilogy of Culture (1936-37) which together with his Trilogy of Knowledge gave a striking exposition of his philosophic theory; at the same time, in the new collections of his verses (In the Courts of Desire, The Secret Marches, 1943) the poet gave an increasingly profound and original accent to his cosmic and metaphysical inspiration. In the field of prose the same continuity appeared. The premature death of Pavel Dan (1907-37) robbed his country of a youthful genius of the first order. His only collection of short stories (Urcan the Ancient) was of such high quality as to ensure him a place of honour in his country's literature. Liviu Rebreanu, creator of the modern Rumanian novel, died in 1944. Mihail Sadoveanu continued to add to his reputation as one of the finest fiction writers of Europe. The gifted novelist, Cesar Petrescu, also continued to write. In the documentary and critical fields most of the names of note were already well-known before the war. The great historian Nicolas Iorga was savagely assassinated in 1940 by the fascist Iron Guard. Others, like Perpessicius (Dimitri Panaïtescu), Tudor Vianu, George Calinescu, Mihail Ralea, Serban Cioculescu, Vladimir Streinu, continued their work as literary critics, essayists or documentary historians. Many younger writers pressed on the heels of these masters. Several prose writers of undoubted talent may be mentioned, such as the novelists Radu Tudoran and Lucia Demetrius, Eusebe Camilar and Geo Bogza, both gifted descriptive writers; the novelist Ovide Constantinescu, and many others. Even more numerous were the young poets. A poetry folio published in May 1946 contained the verses of no fewer than 30 poets, most of them unknown before. It would be difficult to discriminate among the poets without injustice, but Mihail Beniuc, Emil Giurgiuca, Eugene Jebeleanu and Ion Frunzetti were of sufficient importance to be mentioned here.

Switzerland.—The intellectual life of German Switzerland during the years 1937–45 was thrown on to its own resources, for under national socialism those Germanic attributes which gained ascendancy in the reich were in direct opposition to the democratic, liberal, Christian and individualist features of the Swiss national character. The Germans of the reich and the ideology of fascism made scarcely an imprint on the work of contemporary Swiss writers. Undoubtedly Switzerland's national feeling and its liberal-republican spirit gave to its literature a cohesion which counterbalanced the centrifugal effect of the three great language groups outside its frontiers.

The careful and intensive cultivation of local tradition and peculiarities characterized the whole of Swiss literature and was particularly evident among the Rhaeto-Romanic authors of the Grisons (Graubünden) canton. It was also natural that the German-Swiss dialect should have maintained its tenacious hold; indeed each German-Swiss canton still produced its local bard. In the sphere of nondialect literature, too, "land and people" still predominated as the main subjects but the charming idyll of Seldwylertum, that is, of small-town life, grew outmoded, and a more sharply realistic outlook became general.

Naturalist prose in French attained the highest artistic level in the life work of the novelist C. F. Ramuz. Fribourg and the aristocratic-Catholie tradition of Switzerland found an exponent both combative and full of esprit in Gonzague de Reynold; and Geneva was represented by Robert de Traz and Paul Chaponnière. The noble art of Francesco Chiesa, most important Italian-Swiss writer, was also materially inspired by his native environment. Landscape and history were the twin sources of inspiration of German-Swiss writers, such as Emanuel Stickelberger of Basle (Holbein-Romane), Robert Faesi of Zurich (Die Stadt der Väter; Die Stadt der Freiheit), Gottlieb Heinrich Heer and Meinrad Inglin of Schwyz, who went back to the legendary sources of the confederation (Jugend eines Volkes) and painted a comprehensive picture of its fate in World War I (Schweizerspiegel). The introspective approach predominated in the self-analytic work of Hermann Hesse, a German by birth who acquired Swiss nationality and crowned his rich literary career with the Utopian novel, Das Glasperlenspiel. In German Switzerland, sincere fiction writers like Maria Waser (died 1939), Cécile Lauber, Regina Ullman and Ines Loos contributed to the enrichment of the narrative art. Felix Moeschlin and Jakob Bührer were concerned with social problems. In French Switzerland, the representatives of the psychological novel, Robert de Traz and Jacques Chenevière (Les Captives), disclosed the influences of the French school, as did Pierre Girard and Clarisse Francillon.

Although lyric poetry continued to be less a specific Swiss art—Swiss poetry was predominantly epic—there was

a surprising progress toward finer poetic expression. Among the German writers, that progress was evidenced by Albin Zollinger (1895–1941), Siegfried Lang, Max Geilinger, Max Pulver, Werner Zemp and in the religiously inspired poetry of the anthroposophists Albert Steffen and Hermann Hiltbrunner. The French poems of Henry Spiess, François Franzoni and René-Louis Piachaud were of real artistic value.

In the sphere of drama, two almost contradictory trends were evident: on the one hand, the indigenous, patriotic, often rural, tradition which was frequently sponsored by amateurs in festival performances (e.g., René Morax at Mézières) or in open-air theatres (Einsiedeln, Lucerne, Berne); and on the other hand, the internationally-minded theatre of the towns. In both spheres the producer Caesar von Arx was most successful (General Suter; Verrat von Novarra). In the theatres of the towns W. J. Guggenheim (died 1946), Albert J. Welti, Hermann Kesser and, representing the younger generation, Max Frisch all left their mark; so too did the French Swiss Alfred Gehri (Sixième Etage) whose work showed the influence of Paris.

The German-Swiss Eduard Korrodi and Max Rychner and the French-Swiss Robert de Traz, Henri de Ziégler and Charly Clerc were outstanding as literary critics. Walter Muschg (Gotthelf) and Emil Staiger gave a new impetus to the history of literature; Julius Schmidhauser (Der Kampf um das geistige Reich) and Hans Urs von Balthaser (Apokalypse der Deutschen Seele) to metaphysical writing; and Fritz Ernst, attempting to define Switzerland's spiritual status inside Europe (Helvetia Mediatrix), to the comparative study of civilizations.

In English-speaking countries, the work of the leading psychologist C. G. Jung, found increasing notice as did also that of Karl Barth and Emil Brunner, who renewed Protestant theology. (R. FI.)

Yugoslavia.—Strictly speaking, there was still no Yugoslav literature. There were at least two, or even three, different literatures, which might be classed under the name Yugoslav; there was a Serbo-Croat, i.e., a Serbian and Croatian, and a Slovenian literature. The Serbo-Croat literature used the same language, but while the Serbs, in the main, use Cyrillic script, the Croats use Latin script. Slovenian literature is written in Slovenian language, and uses Latin script. The liberation of Yugoslavia also gave birth to a new literature—the Macedonian—which did not exist in earlier times. The few Macedonian writers used to write in either Serbian or Bulgarian. They now used Macedonian language, which had established itself somewhere between the Serbian and Bulgarian languages. Modern Yugoslav literature, in the main, had been developing under French and Russian influences. German influences could, to some extent, be traced in Croatian and Slovenian literature. The modernist literature, flourishing after World War I, declined rapidly after 1930. It was both 'decadent and somewhat esoteric; it had nothing in common with the people and was therefore little read. The only modernists who survived were surrealists (their leader, Marko Ristitch, became Yugoslav ambassador to France), a survival to be ascribed to their acceptance of leftist ideology and to their social realism. Postwar Yugoslav literature was strongly social, revolutionary in its themes, though not in its language, and almost completely under the influence of Russian literature, old and new. During World War II, many writers were murdered by the axis soldiery, while some escaped to the mountains, actively fighting against the invaders. There, in spite of almost insuperable difficulties, they wrote books, mostly poetry, of blood and death, hope and pride.

The most representative writer of the new period, as of the preceding one, was Miroslav Krlezha. His fame spread outside his own country, and his books like Balade Petrice Kerempuha (Ballads of Petrica Kerempuh), Hrvatski Bog Mars (The Croatian God Mars), U Agoniji (In Agony) met with remarkable success. Vladimir Nazor, whom the Croats regarded as one of their greatest poets, joined the liberation army in 1943 and wrote a book in diary form entitled Sa Partizanima (With the Partisans). Steva Jakovljevitch, rector of Belgrade university in 1946, had a very great success with his book Trilogija (Trilogy). Ivo Andritch, a former diplomat, became also well-known as a writer; during 1945 and 1946 he published three books: Na Drini Chuprija (The Bridge on Drina), Travnichka Hronika (The Chronicle of Travnik), and Gospodjica (Miss). Rade Drainac, who died in 1943, exercised great influence on young writers before the war. Veliko Petrovitch with his Sto Prica (Hundred Tales) ranked also among the best Yugoslav writers. Among the Slovenes Prezhihov Voranc, Matej Bor, Jush Kozak, Alojzije Gradnik, R. Mrzelj and Franc Vodnik were in the front rank. Among the writers who made their names during and after the war were Radovan Zogovitch, Tchedomir Minderovitch, Branko Tchopitch and Ivan Goran Kovatchitch, whose poem Jama (Pit) was considered one of the best poems in Yugoslav literature. Kovatchitch lost his life during the war. Among the diarists, easily the best was Vladimir Dedijer, whose Dnevnik (Diary) was a fine chronicle of events from the beginning of revolt in Serbia (1941) until the day of victory. (A. Bil.)

Ceylon

A British crown colony lying off the southern extremity of India and approaching within 6° of the equator, Ceylon has an area of 25,332 sq.mi.; capital Colombo (census 1931, 284,155); chief towns: Jaffna (45,708); Galle (38,424); Kandy (37,147). Languages: English, Sinhalese, Tamil. Religions: Buddhism, Hinduism, Mohammedanism and Christianity. Pop. (census 1931) 5,312,548; (est. 1944) 6,384,000; Sinhalese 4,000,000; Tamils 1,500,000; Moors 325,000; Burghers 35,000; Europeans 10,000. Governors of Ceylon during the decade 1937–46 were: Sir Andrew Caldecott (Jan. 19, 1937–Sept. 1944); Sir Henry Monck-Mason Moore (after Sept. 19, 1944).

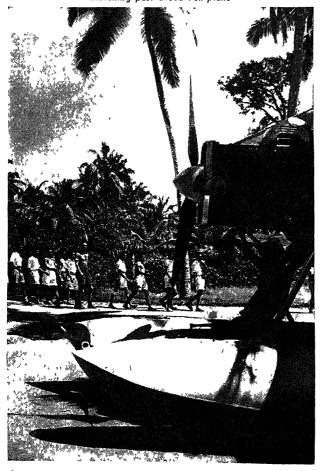

The widely differing racial and religious groups reproduced in miniature some of the difficulties which India encountered in progress toward self-government. Under the Donoughmore constitution of 1931, the government was vested in a council of state, elected by all male citizens over 21 and all women over 30. Sixty-five members were elected territorially, three appointed ex officio and up to 12 nominated by the governor. The council of state divided itself into seven executive committees, each with its chairman. The chairmen, together with the chief secretary, the treasurer and the attorney general, formed a board of ministers which was responsible for conducting the business of government and framing the budget. In practice the Donoughmore constitution proved acceptable to no political party. In the words of the governor, it developed "no party programs, policies or loyalties."

As soon as World War II was over, a commission presided over by Lord Soulbury drafted a fresh constitution which was accepted by the council of state by 51 votes to 5. The council of state was replaced by a parliament consisting of two houses, a senate with limited authority and a house of representatives elected by adult suffrage. This parliament was given full powers to legislate on all domestic matters; but certain subjects, such as the protection of the rights of racial and religious minorities, foreign affairs, defense and currency were vested in the governor. Thus Ceylon provided the first instance of a member of the colonial empire with a non-European electorate reaching the threshold of dominion status.

From 1937 to 1946, considerable progress was made in local self-government. Village communities were encouraged to take responsibility for managing their own affairs, and two special reorganization officers, one Tamil and one Sinhalese, were appointed as travelling advisers. A great impetus to the co-operative movement was given in 1943, when over 1,000 new co-operative societies were started. Pedigree cattle were imported from Australia to raise the standard of stock breeding, and selected students were sent over to India for veterinary training.

Every effort was made to render Ceylon self-supporting during World War II. The production of essential products such as rice and copra was increased, and rural schools undertook the cultivation of 30,000 ac. of land. Factories for the production of quinine, acetic acid and plywood

Ceylon: Statistical Data

were established, and researches in cotton-growing were undertaken. The plumbago mines were working at full capacity, and valuable deposits of iron ore were discovered. Good progress was made with the Watawela hydroelectric scheme. With the fall of Malaya, Ceylon became the chief source of natural rubber in the empire. A "grow more rubber" campaign was inaugurated, and in 1942 125,400 short tons of rubber were produced by "slaughter tapping" and other intensive methods of production.

Ceylon's progressive educational policy and high standard of literacy continued. Before World War II a rural reconstruction campaign, including an extensive program of adult education, was in progress. In 1940, the foundation stone of a Moslem training college was laid, and a school of agriculture was opened at Peradinya near Kandy. One of the last acts of the council of state was to debate a report of a committee appointed to consider the educational defects of the island, and its leading recommendation was that all education, from the kindergarten to the university, should be free. In 1946 this was being carried into effect. The leading event of the period, however, was the foundation in July 1942 of the University of Ceylon as an autonomous body conducting its own examinations. This was achieved by the amalgamation of the Ceylon university college, which had been formerly affiliated with London university, and the Ceylon medical college.

Ceylon's strategic position brought it into the front line early in the war, and civil defense measures were well in hand before the declaration of hostilities by Japan. A civil defense committee was set up, and more than 30,000 people enrolled in civil defense and air raid precaution services. These measures were severely tested by the great air raid on Colombo harbour on April 5, 1942, when several ships were sunk and harbour installations damaged, but the raiders were driven off with a loss of 27 planes. A raid on the harbour of Trincomalee was also repulsed, but the aircraft carrier "Hermes" was sunk. An essential service labour corps was recruited for the construction of aerodromes and defense works, loading and unloading of ships and other similar services. The general policy was that manpower which could be spared from non-essential industries should be employed in local defense, but volunteers from the Ceylon planters' rifle corps saw service in Syria and Libya, and a unit of the Ceylon garrison artillery went abroad in 1941. Some hundreds of Ceylonese served overseas with the royal army service corps. Military service for Europeans was made compulsory.

As the tide turned, Ceylon was equipped as an offensive base. Aerodromes were hacked out of the jungle, and aircraft and military supplies of every kind poured into the island from Great Britain, Australia and the U.S. In April 1944, Admiral Lord Louis Mountbatten moved his headquarters to Ceylon, which was to be the springboard for the assault on Malaya. The attack launched upon Sumatra with warships and aircraft carriers was the prelude to a large-scale invasion, which was forestalled by the surrender of Japan on Aug. 14, 1945.

All communities contributed generously to the war effort. Gifts for aircraft amounted to £375,000 from government and £236,800 from private sources. (H. G. RN.)

Chamberlain, Arthur Neville

Chamberlain (1869–1940), British statesman, was born March 18, 1869, the son of Joseph Chamberlain. He was educated at Mason college, Birmingham. For many years he engaged in business in Birmingham and was lord mayor of the city in 1915–16. During World War I he was director of national service, and in 1918 he was returned to parliament from the Ladywood division of Birmingham. In 1922 he was appointed postmaster general, and later was minister of health and chancellor of the exchequer, holding each post twice. In May 1937 he succeeded Stanley Baldwin as prime minister.

As prime minister Chamberlain was confronted with the task of meeting the growing menace of Germany to the peace of Europe. His policy of "conciliating" Hitler culminated in the pact of Munich in 1938, which he declared guaranteed "peace in our time." But Hitler's breaking of the pact in March 1939 by the occupation of Czechoslovakia, convinced Chamberlain of the threat of German aggression. He pledged Britain's support to Poland if attacked, and when Germany made war on Poland, Great Britain and France declared war against Germany. He was succeeded as prime minister by Winston Churchill May 10, 1940, and gradually withdrew from all political activity. He died at his country estate, Heckfield house, Odiham, Hampshire, on Nov. 9, 1940.

Chambers of Commerce

A staggering share of the effort to surmount the problems of World War II fell upon U.S. business, since solutions to a great extent lay in the full utilization of available manpower and material for the production and distribution of goods. As a major spokesman for business, the responsibility of the Chamber of Commerce of the United States multiplied many times during the decade 1937-46. The chamber, with headquarters in the heart of the nation's capital, served as a day-by-day liaison between business and government. It carried to congress, and to the administration, the opinions of business on national affairs. In turn, it gave to business, in the manner of an information clearing house, not only the attitudes and actions of congress and the administration, but also a broad measure of technical assistance to strengthen the processes of free enterprise.

The chamber was created in 1912 to supply to government agencies and the law-making authorities the considered judgment of business on economic issues and to interpret to business the operations of the federal establishment. It united into a federation of business enterprise some 1,700 local chambers of commerce, and 500 national and state trade associations. These commercial bodies themselves had a membership of more than 1,000,000 firms, corporations and individuals in 1946. A majority of the largest business concerns of the country, as well as a host of smaller concerns, were sustaining members of the organization.

The chamber at the end of the decade was divided into departments representing the major groups of business enterprise, each department having an advisory committee of business men to propose policies. Something of the work of the chamber within the ten-year period 1937–46, as carried on by its departments and committees, is told in the following summary:

The chamber's agricultural committee worked to bring about better understanding of the interdependence of rural and urban areas, as a necessary achievement for national prosperity.

The Committee on Distribution sought to promote the interests of the distributive and service trades. In 1946, the committee entered into a long-range program for faster and broader distribution methods, and wider dissemination of information.

Early in the ten-year period, the chamber began the task of formulating workable policies in regard to labour-management problems. Its Committee on Manufacture worked unceasingly to narrow the breach between the two groups, as a means of expanding industrial production, especially during the war, and in the postwar period. The chamber was an active participant in the labour-management conference called by the government in the fall of 1945.

The chamber's Foreign Commerce department co-operated with exporters and importers in seeking removal of trade barriers and improving trade relations. A joint committee composed of representatives from both the U.S. chamber, and the Canadian Chamber of Commerce, operated to further trade between the two countries. A Pan-American committee also was activated, to accelerate the clearance of trade channels between the U.S. and its sister republics to the south.

Increasing the usefulness and effectiveness of local chambers, through interchange of ideas on community develop-

ment programs, was a major project of the chamber's Commercial Organization department. Also, the establishment of special committees was sponsored within local chambers, to improve the nation's educational plan. Studies made by the chamber's Committee on Education showed that where educational levels were high, living standards were high, and business and the community profited accordingly.

War increased the responsibility of insurance companies to provide security and protection. Therefore, a special advisory committee was initiated within the chamber structure, to assist in reducing the national burden of illness and disability.

Veterans' affairs were given attention by a special assistance staff.

Problems relating to housing were examined closely by the chamber's Construction and Civic Development department, and pertinent legislation was followed closely. The chamber believed that construction was a problem to be met primarily by free enterprise.

A unified program for the preservation of natural resources was upheld by the chamber, as well as plans for the best possible utilization of the nation's transportation and communication systems, in peace as well as in war.

The broad field of finance and government fiscal policies at home and abroad, were of increasing concern to business and the chamber. To increase the understanding and interpretation of numerous economic problems, a new unit was added to the chamber's departmental structure: a Department of Economic Research. Here, specialists examined economic data, and served as a research staff for business, and often for government, on a multitude of related subjects.

Another office activated during the period, the Department of Governmental Affairs, was given a broad directive to strengthen the over-all relationships between government and business. This department was created to act as a co-ordinator of chamber policy and as a working link between congress and chamber members. Under its sponsorship, more than 1,500 National Affairs committees were formed in local chambers and in trade associations, to encourage individual action for better government.

The U.S. defense period, the years of war and the reconversion period necessitated unusual activity along specific lines by the chamber. First, a special committee on national defense was formed. And, with the onset of hostilities in Dec. 1941, a War Service division was established as a central clearing desk on matters pertaining to production and preparedness. A Win-the-War committee integrated the whole national organization of the chamber behind the war effort. As an aid to cities in postwar development, the chamber named a Committee on Urban Problems to assist on matters relating to housing, public works and transportation, as well as civic advancement.

During the ten years the chamber participated in hundreds of conferences held by governmental, business, educational and other groups. At the international business conference at Rye, New York, in 1944, chamber representatives met with businessmen from 52 nations. The chamber was invited to name a representative to the United Nations Educational, Scientific and Cultural Organization.

In 1945 the U.S. associates of the International Chamber of Commerce, formerly allied only with the National Chamber, as the American section of the International Chamber, came under the sponsorship of four national business groups, including the Chamber of Commerce of the U.S. Activities of the organization were necessarily at

a standstill during World War II, but in the postwar period plans were underway for the furthering of business and cultural relations among the nations. (W. K. J.)

Junior Chambers of Commerce.-The United States Junior Chamber of Commerce, founded at St. Louis, Mo. in 1920, experienced a rapid growth in membership during the decade 1937-46 and by the latter year was serving more than 1,100 communities in the U.S. Associate junior chambers of commerce had been established in 25 countries other than the U.S., and the Junior Chamber International was formally organized on March 3, 1946. The U.S. organization, composed exclusively of young men aged 21 through 35, concentrated upon community service, leadership training and the development of a feeling of responsibility toward government and community life. The principal headquarters were established in Chicago, Ill. Presidents during the decade 1937-46 were as follows: 1936-37, Walter E. Holman, Portland, Ore.; 1937-38, Roswell P. Rosengren, New York city; 1938-39, Philip C. Ebeling, Dayton, O.; 1939-40, Perry P. Pipkin, Memphis, Tenn.; 1940-41, Mark S. Matthews, Miami Beach, Fla.; 1941-42, Walter W. Finke, Minneapolis, Minn.; 1942-43, William M. Shepherd, Pine Bluff, Ark.; 1943-44, H. Bruce Palmer, Newark, N.J.; 1944-45, Mearns T. Gates, Pomeroy, Wash.; 1945-46, Henry Kearns, Pasadena, Calil. (H. Ks.; X.)

British Chambers of Commerce.—Although it was difficult to generalize about a group of independent, selfgoverning organizations, varying greatly in size and scope, a few trends could be discerned in the development of chambers of commerce in Great Britain during the years 1937-46, a period dominated throughout first by the threat, then the reality, of war. In 1935-45 the membership of the chambers in the Association of British Chambers of Commerce rose by more than 25%. Affiliation to the association continued to be regarded as the criterion for a chamber proper, as against an organization concerned primarily with retail trade and purely local affairs. This growth in the support given by industry and trade to the movement as a whole was partly an index of the growing sense that organized representation of business interests is essential. It also showed the value of the chambers' services, and the fact that their functions did not generally overlap those of trade associations, whose number and strength advanced correspondingly in the same years,

The increase in government interference in economic matters was partly responsible for the greater appreciation of the value of business organizations. This trend was already apparent before World War II, but was tremendously accelerated in the process of national economic mobilization. During the war years there was constant need for the chambers to put before the government the point of view of the business man, to explain his problems, and to mitigate, as far as was compatible with the national interest, the hardships created. Such work as the handling of licences, the allocation of import quotas and the fair distribution of supplies was undertaken by some of the larger chambers on behalf of the government.

These activities, however, involved no loss of independence, and chambers retained throughout their right to criticize—a right exercised, however, with a sense of responsibility and an appreciation of the nation's interest. The closer and more constant contact with government departments in fact strengthened the chambers' ability to present their members' views effectively in the proper quarter.

The third trend followed from these contacts—a greater inclination on the part of departments, and to some ex-

tent the government itself, to regard chambers of commerce as representative of commercial and industrial interests as a whole. For some purpose the body speaking for a particular trade would be the obvious organization to consult; for many others it remained desirable to seek a wider and more balanced view, comprising all sections of the business community. This chambers of commerce could provide, for they included manufacturers and merchants, home and export interests, small firms and the largest corporations.

Chandler, Albert Benjamin

Chandler (1898—), U.S. legislator and baseball commissioner, was born July 14, 1898, in Corydon, Ky., and served in the U.S. army in 1918. A graduate of Transylvania college (1921), he later studied at Harvard university, received his LL.B. degree from the University of Kentucky (1924), and then practised law at Versailles, Ky. Elected to the state house of representatives in 1929, he was lieutenant governor of Kentucky, 1931–35, and governor, 1935–39. He resigned the governorship in Oct. 1939 to fill a vacancy in the U.S. senate and was elected for a full six-year term in November 1942.

Chandler, who had played semi-professional baseball in his youth with several small teams, was unanimously selected (April 24, 1945), by the owners of the 16 major league baseball clubs for the office of baseball commissioner after the death of Kenesaw Mountain Landis.

Channel Islands

This group of islands in the English channel belongs (except the Iles Chausey) to Great Britain. Area 75 sq.mi. Chief towns: St. Helier, St. Peter Port, St. Anne. Languages, English and French. Pop. (1946) 79,055. For purposes of government the islands were divided into (1) Jersey, and (2) the bailiwick of Guernsey, including Alderney, Sark, Herm and Jethou. Lieut. governors of Jersey during the decade 1937-46 were: Major General H. de C. Martelli (May 28, 1934-Dec. 12, 1938); Major General James Murray Robert Harrison (Dec. 12, 1938-June 7, 1940); Lieut. General Sir Arthur Edward Grassett (after Aug. 25, 1945). Lieutenant governors of Guernsey were: Major General E. N. Broadbent (June 5, 1934-Dec. 12, 1938); Major General Alexander P. D. Telfer-Smollett (Dec. 12, 1938-June 7, 1940); Major General J. R. M. Minshull-Ford (appointed June 7, 1940); Lieut. General Philip Neame (after Aug. 25, 1945).

The Channel Islands were the only British possession occupied by the Germans during World War II. Though already demilitarized, the islands were bombed and machine-gunned by the Germans on June 28, 1940, and many people lost their lives. All the islands were occupied from June 30, 1940, to May 9, 1945, when 30,000 Germans surrendered to the British.

In 1942 the Germans deported from the islands to internment camps in Germany, people of all ages and classes numbering 1,186 from Jersey, 800 from Guernsey and 64 from Sark, and including all retired British naval and military officers up to 69 years of age. Most of these persons returned to the islands. A small number died in the camps. Thousands of foreign workers were brought over by the German organization Todt to construct roads, tunnels, sea walls and fortifications of all kinds. They were all deported after the war.

The food supplies were very precarious during the German occupation, many substitutes being employed,

such as bramble leaves, green pea pods and seaweed; finally in Jan. 1945 the International Red Cross sent a ship with supplies for the islanders. The Germans had carried out large-scale fortifications and mined large areas of land which considerably affected the agriculture, in some places permanently. The famous cattle of the islands remained in their purity of breed, though depleted in numbers. By the summer of 1946 the islands had made a remarkable recovery and all visible signs of German occupation, except for a few gun emplacements, had been removed. The British government offered a capital sum of £4,200,000 to Jersey and £3,300,000 to Guernsey for liquidating part of their debt, and it was also arranged that the balance of the expenditure required for reconstruction purposes (some £7,500,000 for Jersey and some £6,000,000 for Guernsey) would be borrowed by the islands.

In Sept. 1946 a committee of the privy council, which had been appointed at the request of the islanders to inquire into reform of the constitution of the "states" of Jersey and Guernsey, spent a week in the islands hearing witnesses. Reforms urged by the Jersey Labour party, Communist and other parties were, briefly, that the states (parliaments) should be more democratic: that the position, in particular, of the rectors of parishes and the jurats (elected judges for life), who held seats by virtue of their office, should be reviewed and more seats allotted to elected representatives. The position of the jurats who both made the laws and administered them was considered anomalous. The question of changing the official language from French to English was also raised, and in Guernsey a royal court subcommittee suggested in Sept. that the change-over should be gradual and that exceptions, such as the Lord's Prayer and the Clameur de Haro, the traditional form of protest against grievances, should be made.

King George VI and Queen Elizabeth visited the islands on June 7, 1945. A committee of the privy council visited the islands in August to assist in revising the constitution of the states.

In July the Guernsey states agreed to purchase the island of Herm from the British government at a cost of £15,000.

Charles, Prince of Belgium

Prince Charles of Belgium (Charles Théodore Henri Antoine Meinrad, Count of Flanders) (1903—), was born Oct. 10, 1903, in Brussels, brother of Leopold III, king of the Belgians. Shortly after Allied troops entered Belgium in the fall of 1944, partly liberating the country, Prince Charles was appointed (Sept. 20, 1944) regent by a joint vote of parliament.

After Leopold's release by Allied troops from German custody in May 1945, his return to the throne was approved by the Catholic party, but was opposed by the Liberal, Socialist and Communist parties, and Charles continued to serve as regent.

Chautemps, Camille

Chautemps (1885-), French politician, was born in Paris. After his admission to the bar, he practised before

the court of appeals and joined the Radical-Socialist party. Later he was elected a deputy for the Indre-et-Loire department; he was a senator representing Loire-et-Cher department from 1934 to the downfall of France in 1940. After holding a number of cabinet posts, Chautemps was premier for 24 hours in 1930 and was again premier in Nov. 1933. In early 1934, he was linked with the Stavisky case by the fact that his brother-in-law, Justice Pressard, who had been compromised in the scandal, committed suicide. His government fell in Jan. 1934 and he returned to the senate. In June 1936 he was minister of state in Léon Blum's Popular Front government. After the fall of the Blum regime the next year, Chautemps once more became premier. The Chautemps regime itself fell in March 1938, and he was then given cabinet posts in the succeeding Daladier government.

Chautemps was one of the sponsors of the Pétain government which concluded the armistice with Germany in June 1940; the following Nov. he went to Washington as Pétain's personal representative. He soon disassociated himself from Vichy and remained in the U.S. capital as a "private citizen." In 1944 the Radical-Socialist party expelled him from its ranks. He returned to France after its liberation and in Aug. 1945 denied Paul Reynaud's accusations that he had conspired to halt French resistance in 1940.

Cheese

Total production of cheese in the United States in 1937 was 648,825,000 lb., near the average for the preceding ten-year period. The output increased slowly until 1940, when it rose to 785,490,000 lb. and in 1942 to a record of 1,112,314,000 lb. The big increase was in American whole milk or Cheddar type, which increased from 492,041,000 lb. in 1937 to a record of 916,850,000 lb. in 1942. Other types of importance in 1942 were American-made Swiss, 52,561,000 lb.; cream cheese, 47,554,000 lb.; Italian varieties, 34,916,000 lb., and brick, 19,588,000 lb. The increase in Cheddar was stimulated to supply British needs through lend-lease and in the other varieties to supply the demand formerly supplied by imports from Europe. U.S. manufacturers began to produce the European types to a larger extent than ever before.

U.S. cheese makers had to compete for milk with the rapidly growing dried-milk industry and in 1942 the government established a subsidy of 3.75 cents per lb. for American cheese. The demand for fluid milk and butter pressed upon cheese production in 1942 and 1943, causing a decline in cheese output. Rationing was invoked to save supplies for the military forces and lend-lease, but only the scarcity of the product in the markets was effective in reducing civilian consumption. Civilian consumption averaged 5.5 lb. per capita in 1935-39 but did not increase in total production; the average for 1945 was only about 5.7 lb. per capita. The end of military buying in 1945, together with the 10% increase in total production in 1945, brought about a slight increase in 1946, to a per capita production of about 6.5 lb. The meat shortage stimulated the demand for cheese in late 1945 and in 1946.

Cheese consumption was 8.6 lb. per capita in Great Britain in 1937 and was also much higher in all Euro-

Cases of Cheddar cheese being inspected by an official of the U.S. department of agriculture in 1941 before shipment to Great Britain under terms of the lend-lease act

pean countries than in the U.S. World War II upset world trade and made it difficult for Great Britain to get imports from New Zealand, which led in exports. Canadian cheese production was stimulated for the British market to help make up the loss of Dutch supplies. Considerable quantities of cheese were shipped to the U.S. from South America, principally from Argentina and Brazil. About one-third of the U.S. cheese supply was used for military and export purposes in 1944 though it was estimated that the domestic market would have absorbed all the supply had there been no restrictions.

World cheese production was sharply reduced during the war by the reduced output of milk in European countries where most of the cheese was made. Up to 1946 the recovery had been small, as breeding animals were scarce and most of the land was being planted to grains for human consumption. There was also the need for the people to consume the grains as food rather than feed them to livestock. (See also Butter; Dairying; Milk.)

Chemical Therapy See CHEMOTHERAPY.

Chemical Warfare

The term "chemical warfare" is generally accepted as including those forms of warfare in which chemicals are directly employed, utilizing chemical action rather than mechanical energy to implement military operations. Notable examples are: poison gases, smoke-producing materials and fire-raising munitions. Under this category may also be included biological agents.

By 1937, increasing uneasiness arising from the unsettled international situation was causing military authorities of all major powers to re-examine the possibilities of chemical warfare, which had first been exploited under modern conditions during the years 1915–18.

Gas Warfare.—Peacetime popular opinion among nonmilitary nations was on the whole averse to the use of poison gas, much as the ordinary individual in such nations was averse to war itself. Military opinion on the subject in the U.S. and the British empire was somewhat mixed; there was some scepticism as to the relative value of gas as a weapon, although U.S. chemical resources were seen to place the U.S. in an enviable position in this field. However, lack of appropriations had prevented extensive research looking to discovery of materials more toxic than those already available; e.g., dichlorodiethyl sulphide (mustard gas), chlorovinyl dichloroarsine (lewisite) and carbonyl chloride (choking gas).

In Germany, one new gas had been discovered, somewhat accidentally, and was undergoing experimentation. Shell and bomb filling plants were being developed for rapid loading of gas munitions and sizable stocks were beginning to accumulate. However, the impetus of German research in 1937 was being directed toward objectives which the nazis believed to be more promising of results in the wars they were planning. The Japanese had developed no new gas agents, nor did they do so during the ensuing war years.

Most nations, with the notable exception of the U.S., had subscribed to international agreements to abstain from the use of poison gas in war. Although the U.S.A. was not party to such agreements, the nation's policy in this direction had been clearly announced and was in line with that formally accepted by other powers; in short, there was in existence what amounted to a principle of international law that no nation would employ gas as a weapon unless forced to do so as a retaliatory measure.

Nevertheless, the looming threat of aerial attack which overhung Europe during the years preceding World War II carried with it considerable apprehension as to gasladen bombs. This had led to initiation of extensive programs for providing civilians with gas masks and other devices for protection against gas attack. Generally speaking, both soldiers and civilians in areas sensitive to attack were trained and equipped to withstand war gases.

The initiative as to gas attack remained with the axis powers throughout the war years. The reasons why this form of attack was never resorted to (except for sporadic instances of small-scale employment by the Japanese on the Asiatic mainland) were fairly clear.

The German government, under direction of Hitler, regarded gas as a secondary weapon which was to be brought into play only in retaliation against Allied employment. That this would have been done is evidenced by the fact that undestroyed stocks of war gases captured in 1945 were found to exceed considerably the total amounts produced by Germany during the years of active gas warfare, 1915–18.

It was difficult if not impossible to determine exactly the motives that led to this decision to keep such a valuable military weapon in the background. It was true that gas had little tactical value in conjunction with the blitz-krieg methods on which the Wehrmacht relied so heavily for victory. For the aerial attack of London, the Germans had in reserve an incendiary bomb which they thought to be surpassingly effective. When Germany was finally thrown on the defensive, the luftwaffe had become a weak instrument, leaving German cities vulnerable to aerial gas attack by superior Allied force.

Repeated warnings by heads of the British and U.S. governments that retaliation in gas would be prompt and overwhelming certainly played a part in checking inclination to bring forward the gas weapon. This was a matter of some concern to Tokyo, and specific instructions were issued by the Japanese emperor that no field commander was to release gas without specific authorization.

Although poison gas was not brought into action during World War II, some tactical concepts as to its employment had necessarily to be modified because of advances in other fields of military technique during the ten eventful years. For example, the cloud gas form of attack, involving release of a gaseous agent from stationary containers, was later seen to be obsolete because more effective results could be obtained by use of large aerial bombs. Increasing likelihood of applying gas warfare through the air forces tended to emphasize gas as a strategic rather than a tactical weapon.

Reviewing the gas situation as it existed at the close of hostilities in 1945, Allied authorities considered that they had scored a victory in the field of gas warfare inasmuch as their announced policy of avoiding the use of gas had been sustained, but only by intensive preparations on their part for both offense in, and defense against, this type of chemical agent. Proof that such a potentially deadly weapon could be held in check by realistic preparedness was not without possible significance in considering the future of atomic warfare.

Chemical Smoke.—Use of smoke for blinding an enemy or obscuring friendly troops was an old technique. In 1937 many armies, notably that of Germany, included units specially equipped to put down smoke screens. Standard methods included firing of smoke shells, use of smoke pots, dropping of aerial smoke bombs and release of smoke-producing agents from tanks carried by low-flying aircraft.

The advent of large-scale strategic bombing developed an urgent requirement for smoke to conceal important ground targets from aerial attack. Need for obscuration over wide areas and for extended periods of time constituted a demand different from that which had previously been met with tactical munitions.

To satisfy this requirement, mechanical smoke generators were developed and put into use by 1941. As finally perfected, these generators were capable of processing boiling hydrocarbon oil into aerosols of high obscuring power and considerable persistency. They found particularly effective use in Europe in preventing aimed bombing of harbour installations and in covering river crossings. For tactical use, lightweight, easily portable units of smaller capacity were supplied.

In both tactical and strategic missions smoke was more widely used between 1943 and 1945 than ever before. By the end of hostilities it had become practically an "on call" weapon of air as well as ground forces. Much of this increased usage could be attributed to the ease of production and general effectiveness of fog generated from oil.

Besides obscuring smokes, always most effective in white or gray tones, an interesting new development of the decade was the introduction of coloured smokes for use in signalling. They appeared in a variety of hues, permitting selection of colours in distinct contrast to local terrain; they could be discerned from great distances.

Biological Warfare.—Use of germs or bacteria in war had excited the imaginations of scientists for many years. In 1937 it was known that the possibilities of this type of warfare were being quietly explored in many directions. Numerous practical limitations to the employment of bacteriological agents, however, were recognized. On the other hand, the idea of weakening a prospective adversary well in advance of active hostilities by the insidious introduction of germs to destroy either animal

or vegetable life presented a hazard too real to be over-looked.

As a result, research in biological warfare during World War II was actively pursued by the leading belligerents with emphasis on means for detecting evidence of this type of attack and of checking its effectiveness. There was no authenticated instance of the use of bacterial agents during the war.

At the same time, there was no assurance that they would not be introduced in future wars except insofar as reasonable preparedness might serve to deter their employment. (See BIOLOGICAL WARFARE.)

Incendiaries.—The incendiary weapon proved to be the outstanding development of chemical warfare during this period (See Incendiary Warfare.) It was used in such prodigious quantities and contributed so heavily to the weakening of the axis powers that, except for the introduction of the atomic bomb, it would have rated as the outstanding new weapon of World War II. (See also Munitions of War; Tactics of World War II; World War II.)

Chemistry

Out of the vast array of chemical developments which appeared during the decade 1937–46, a few fields stood out prominently; namely, hydrocarbons, synthetic plastics and high polymers, structure of natural products, new medicinals, carbohydrates, inorganic chemistry, nuclear chemistry and new atoms.

Developments in hydrocarbon chemistry included gasoline by polymerization, mechanisms in pyrolytic reactions, catalytic cracking, nitration, butadiene, synthetic rubber and production of thiophen. New plastics included polystyrene, nylon, saran, plexiglas, polyvinyl butyral, allyl plastics such as CR-39, allylstarch, vinyon, ethylcellulose and many others. Natural products extensively studied were steroids, vitamins B₁, B₆, E, K, marijuana, biotin, cork, pantothenic acid and dicoumarin. High in the list of medicinals developed during this period were the sulfa drugs, antimalarials, penicillin and streptomycin. Nuclear chemistry had a spectacular growth, dealing as it did with deuterium or heavy hydrogen, uranium 235, new atoms such as plutonium and the atomic bomb. These topics will be developed in turn.

Hydrocarbons

Gasoline by Polymerization.—When kerosene lamps were in vogue, before the day of the automobile, the problem of the petroleum refiner was that of increasing the kerosene output at the expense of the gasoline. With the disappearance of lamps and the advent of automobiles this situation became reversed. The supply of straight run gasoline became increasingly less adequate until finally the "cracking process" came to the rescue. As is well known, the mineral oils, which are represented as large hydrocarbon molecules, may become broken down into smaller, more volatile hydrocarbons by high temperature methods of "cracking" or pyrolysis. To illustrate, an oil which is too nonvolatile for motor fuel might contain 18 carbon atoms per molecule. On cracking, it might break into two smaller

molecules of nine carbon atoms each. This smaller hydrocarbon would be in the satisfactory boiling point range for acceptable gasoline. It would be satisfactory also if the C_{18} broke into $C_{10}+C_8$ units or even three C_6 units, but the trouble is that much of the pyrolysis gives rise to still smaller units which are gaseous and hence just as unfit for purposes of gasoline as the original oil. Various uses for the gas were devised, but to a large extent it was used merely as fuel for the refinery furnaces.

It had been recognized for years that a major problem was that of recombining the smaller, gaseous hydrocarbon units into gasoline. Thus, if two C_4 units (butylene) could be welded together, a C_8 molecule (octylene) would result. Similarly, three C_3 units (propylene) could be visualized as the precursor of a nonylene (C_9H_{18}). This process became known as polymerization.

Although polymerization of olefines was not new, the industrial application of it did not appear until 1937. In one installed process, yields of 3.3 to 10.9 gallons of gasoline were realized per 1,000 cu.ft. of cracked gases which contained 18% to 69% of propylene and butylene. V. N. Ipatieff and co-workers were particularly active in this development. They found that phosphoric acid was very effective in promoting the polymerization. Phosphoric esters, the addition products of the acid and olefine, were formed first; e.g., isopropyl dihydrogen phosphate, H₂PO₄C₃H₇, from propylene. At the temperature of the reaction involved (100°-200° C.), two such molecules are considered to interact, regenerating the phosphoric acid (2 H₃PO₄) and forming one molecule of hexylene, C₆H₁₂. By continuing the same mechanism, the C_6H_{12} may change further to C_9H_{18} or $C_{12}H_{24}$. One feature about the polymer gasoline is its high antiknock rating. Such is the case because the carbon skeletons of the hydrocarbons produced are necessarily branched-chain, not straight-chain.

Mechanisms in Thermal Decompositions.—The preceding years had witnessed a remarkable development in understanding what goes on "behind the scenes" in organic reactions, especially in reactions of pyrolysis. Tangible evidence for at least three mechanisms had been demonstrated, two of which were reported by C. D. Hurd and collaborators in 1938. A semi-ionic mechanism was shown to apply for the thermal rearrangement at 200°-250° C. of unsaturated ethers into phenols, or the related rearrangement of allyl vinyl ether into allylacetaldehyde. A mechanism involving a hydrogen bridge accounted satisfactorily for the pyrolysis at 400°-500° C. of esters into acids and olefines. The absence of other products such as aldehydes was evidence that preliminary scission of the ester into unstable parts or radicals could not apply. Such a mechanism did apply, however, in the decomposition at 550°-700° C. of such compounds as paraffin hydrocarbons. The radicals, formed initially, generally do one of two things: decompose further into an unsaturated compound and a smaller radical, or react with the surrounding molecules of the original substance.

In the last type of mechanism it is important to know the strength of bonds between atoms, because the initial split should come at the point of greatest weakness. F. O. Rice approximated the strength of the bond which breaks by finding the "activation energy" involved in the pyrolysis. The activation energy plus the average energy of the molecules at the temperature of decomposition gives a satisfactory measure of the strength of the linkage which breaks. Experimentally, this activation energy was determined by passing the vapours of the compound rapidly through an evacuated tube heated to different measured temperatures and noting the time required to remove a

standard metallic mirror of antimony by its combination with the reactive radical and subsequent volatilization. Since this time of removal depends on the concentration of radicals at that point it is related also to the rate of dissociation of the original compound. If, therefore, the experiment is performed at two or more temperatures, the activation energy may be calculated.

As would be expected, there was considerable variation in the strength of various bonds. That between carbon and oxygen (in methyl ether) was stronger than the one between carbon and nitrogen (in trimethylamine). The former was 81,100 calories and the latter 50,800. The carbon-to-carbon bonds in ethane, propane and heptane respectively were 79,500, 71,500 and 63,200 calories. This demonstrated a definite lessening in stability in passing from the lower to the higher members of the family of saturated hydrocarbons. G. B. Kistiakowsky observed a similar diminution of activation energies in the pyrolysis of tertiary butyl and tertiary amyl alcohols. The former 4-carbon alcohol gave 65,500 calories, whereas the latter 5-carbon alcohol gave 60,000. Generally, activation energies of 50,000-80,000 calories may be expected for such decompositions in the aliphatic series.

Subsequent reactions of the radicals proceed in the direction of lower activation energies. The methyl radical (CH₃), once formed, is prevented from changing into a methylene radical (CH2) because at least 100,000 calories would be required. Other radicals such as ethyl, propyl, etc., may decompose readily enough. Only 49,000 calories are required to change ethyl (C₂H₅) into ethylene (C₂H₄) and atomic hydrogen (H). Still smaller energies are required for higher radicals. Even smaller energies are required for the radicals to appropriate hydrogen from neighbouring molecules on collision with them. Thus, the reaction: methyl+ethane (C2H6) to produce methane (CH₄)+ethyl requires only 20,000 calories. A similar energy requirement is involved in the change of atomic into molecular hydrogen (H to H2) by collision with ethane.

New radicals are set up by these collisions and a chain of reactions is inaugurated. Such a reaction mechanism implies that pyrolyses could be induced at temperatures considerably below the ordinary decomposition temperature if only some supply of radicals was present. This implication was substantiated in A. O. Allen and Darrell V. Sickman's work on acetaldehyde, and in Paul Cramer's work on hydrocarbons. It happens that acetaldehyde is stable at 300° C. whereas azomethane gives rise to methyl radicals at that temperature. A mixture of acetaldehyde and azomethane was heated to 300° C. with the result that a normal type of pyrolysis of the aldehyde was obtained. Hence, the methyl radicals must have initiated the breakdown of the acetaldehyde.

High-Test Gasoline.—Improvement of the quality of motor fuel was an outstanding achievement of U.S. chemists during the decade. The standard by which such fuels were evaluated was 2,2,4-trimethylpentane, an octane which was arbitrarily assigned a value of "100 octane" in the fuelrating scale. Important milestones in this phase of petroleum technology were thermal cracking or pyrolysis, the use of tetraethyl lead, catalytic cracking and the alkylation by gaseous unsaturated hydrocarbons of paraffins such as isobutane or aromatic hydrocarbons such as benzene. The alkylation process may be illustrated by the formation of:

(a) 2,2-dimethylbutane from ethylene and isobutane at 480° C. and 1,000 lb. per square inch; (b) isopropyl benzene from propylene and benzene, with suitable catalysts;

(c) 2,2,3-trimethylpentane from 1-butene and isobutane, in

the presence of concentrated sulphuric acid. Substances a, b and c all contributed to the excellence of aviation gasoline; each possessed a rating of 90–98 octane or better.

The hydrocarbon with the highest octane rating is trimethylbutane (CH₃)₃CCH (CH₃)₂, one of the heptanes known as "triptane." Trimethylbutane is not a new chemical. It had also been known for years that it possessed at least a 50% greater power output than 2,2,4-trimethylpentane, but until 1943 it had been impossible to acquire any sizable quantity of it because of prohibitive costs. A new method was announced late in 1943 by V. N. Ipatieff and V. Haensel of the Universal Oil Products company which was claimed to bring its price below \$1 per gallon. By the end of the decade, however, this material had not been produced industrially.

Fluid Catalytic Cracking.—Reference should be made to a new type of powdered catalyst announced in 1943 for converting gas oil into unsaturated gaseous hydrocarbons. Such a catalyst was used by the Standard Oil Company of New Jersey in its plant at Baton Rouge, La., and by several other petroleum refineries. The catalyst is so fine that it behaves like a fluid and the process is referred to as fluid catalytic cracking. Handling a solid in a manner similar to a fluid is a radical departure from previous industrial practice, and increased production of gasoline with less difficulty was achieved as a result.

Aluminum Bromide Catalysis.—Work initiated by P. A. Leighton and J. D. Heldman at Stanford university, Calif, and continued by Julius Heldman at the University of California gave important evidence on the catalytic isomerization of paraffin hydrocarbons in the presence of aluminum bromide or aluminum chloride. Aluminum bromide is the more powerful of the two, which may be correlated with the fact that butane dissolves aluminum bromide but not aluminum chloride. If either one of the aluminum salts is perfectly pure no reaction occurs, but traces of hydrogen chloride or hydrogen bromide as purposeful impurities suffice to promote the catalysis. Because of this Heldman believed that the true catalyst is the AlBr₄-ion (formed from AlBr₃+HBr).

An ingenious mechanism was proposed to explain the isomerism, the main feature of which is an assumption that the tetrabromoaluminum ion possesses a co-ordination number higher than four, and that it behaves both as an acid and a base. In coming near to the butane molecule (CH₃CH₂CH₂CH₃) it acts as an acid and attracts a terminal methyl group (CH₃) as a negative ion. Concurrently it acts as a base by attracting a hydrogen positive ion from the no. 3 carbon of the butane skeleton thereby leaving a 3-carbon fragment (CH₂–ČH–CH₃) from the butane. Readjustment of electrons within this fragment (to ČH₂–ČH–CH₃) paves the way for the addition of the H⁺ and CH₃– to produce isobutane, CH₃CHCH₃

 CH_3

Interaction of isobutane with an unsaturated hydrocarbon such as ethylene is also catalyzed by aluminum chloride and hydrogen chloride. This reaction had been known for some time, but L. Schmerling's (Universal Oil Products Co.) mechanism was the first one to explain the facts satisfactorily. If isobutane ([CH₃]₃CH), ethylene (CH₂=CH₂) and a little hydrogen chloride are the three starting materials, the first step is an addition of hydrogen chloride to the ethylene, after which the ethyl chloride so produced reacts with isobutane to form tertiary butyl chloride ([CH₃]₃CCl) and ethane (CH₃CH₃). In the next step, the

t-butyl chloride adds to ethylene. In the final step, this addition product ([CH $_3$] $_3$ CCH $_2$ CH $_2$ Cl) reacts with isobutane somewhat as ethyl chloride did in the first step to form t-butyl chloride and 2,3-dimethylbutane ([CH $_3$] $_2$ -CHCH[CH $_3$] $_2$).

P. D. Bartlett et al., of Harvard university studied a similar problem, namely, the catalyzed (AlBr₃) exchange of halogen and hydrogen atoms. In an experiment involving t-butyl chloride, isopentane and aluminum bromide, for example; an almost instantaneous (0.001 sec. or less) reaction took place giving rise to isobutane and t-pentyl bromide. With longer periods of contact some of the latter rearranged to 1-methylisobutyl bromide. A positively charged tertiary butyl ion was regarded as the important feature of the mechanism:

 $(CH_3)_3CCl + AlCl_3 \rightarrow (CH_3)_3C^+AlCl_4$

H. Pines and R. C. Wackher (Universal Oil Products Co.) added the interesting observation that isomerization of butane occurs only if a trace of water or oxygen, or olefine is present, even when hydrogen bromide accompanied the AlBr₃. These compounds may be necessary in helping to form the carbonium ions which are apparently required to promote the reaction.

Toluene from Petroleum.—The fact that petroleum companies had become important producers of chemical raw materials was witnessed by the modern development of toluene, butadiene, thiophene and mitroparaffins from petroleum hydrocarbons. Demand for toluene during wartime is always heavy because it is the source of T.N.T. The annual U.S. production of toluene in 1918 was 15,-000,000 gal., obtained almost entirely from coal tar. By 1939 the output was 30,000,000 gal., but in 1944 the quantity had skyrocketed to 250,000,000 gal. The increase came chiefly from petroleum sources by three methods: (1) about one-fifth by recovery of naturally occurring toluene from straight run and cracked naphthas; (2) about seventenths by dehydrogenation of methylcyclohexane, which occurs to the extent of 30%-40% in feed stock from Texas petroleum. This was the "hydroforming process" of the Standard Oil Co. of Indiana; (3) about one-tenth by AlCl3isomerization of dimethylcyclopentane (made from light gasoline and aluminum chloride) to methylcyclohexane, then dehydrogenating the latter. This process was developed by Shell Oil Co.

Two catalysts reported to be effective for the dehydrogenation of methylcyclohexane were molybdena-on-alumina, which is regenerated with air every four hours (to burn off the deposited carbon), and nickel-tungsten sulphide, which is regenerated with hydrogen semiannually. The first of these catalysts was used in the hydroforming process, conditions for which were 540° C. and 250 lb. pressure. The magnitude of the installation may be appreciated somewhat by pointing out that the cost of catalyst per charge was \$400,000, such a charge being effective for about seven months.

The toluene as produced was mixed with paraffins, cycloparaffins and olefines. Separation from this mixture was a major problem. The problem was solved by use of two new techniques: (1) extractive distillation with phenol, the latter clinging to the toluene more than to the paraffins; (2) azeotropic distillation with methanol or methyl ethyl ketone. Distillation towers as tall as an eight-story building were used in these steps, and toluene of 99% purity was obtained.

Synthetic Rubber.—The year 1940 witnessed a remarkable development in the technology of rubberlike materi-

als. Rubber itself is a hydrocarbon, the molecules of which are of gigantic size compared with molecules of simple hydrocarbons such as pentane, acetylene, benzene or naphthalene. In spite of its vast size, consideration of the structure of the jubber molecule reveals a simple pattern. It is merely a collection of about 2,000 small methylbutadiene or isoprene molecules joined end to end.

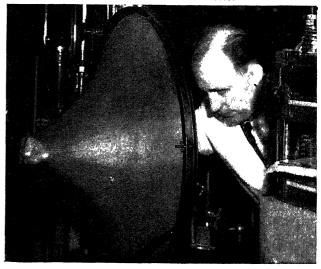

Experimentally, one may convert methylbutadiene, a low-boiling liquid, into rubber by leaving it in contact with metallic sodium. No convenient source of methylbutadiene was known in 1940, however.

Butadiene and chlorobutadiene do have convenient sources, so they provide good starting materials in the synthesis of rubberlike products. Both may be made from vinyl acetylene (C_4H_4) which, in turn, is made by causing acetylene (C_2H_2) to double up with itself in the presence of copper salts. Addition of hydrogen chloride yields chlorobutadiene (C_4H_5 Cl), whereas insertion of hydrogen yields butadiene (C_4H_6). Butadiene may be made also by catalytic subtraction of hydrogen from butane (C_4H_{10}) or butene (C_4H_8), but these are available only in petroleum-bearing countries.

The "rubber" made from chlorobutadiene had been marketed in the United States after 1932 under the name of Neoprene. The buna rubbers, which had been developed somewhat in Germany, were even newer. Their manufacture involves butadiene and another unsaturated substance. Buna-S, later named GR-S, incorporates butadiene and styrene. Buna-N and perbunan are made by the copolymerization of butadiene and acrylonitrile (vinyl cyanide). Buna-N and Neoprene resist the swelling action of gasoline far better than ordinary rubber does. Buna-S possesses better abrasion resistance than rubber itself, making it especially valuable for treads of tires. It is noteworthy that these desirable properties arise from the introduction of some other unit to participate in a "cross-polymerization" with the butadiene. An undesirable quality of this kind of rubber is its tendency to heat on flexing.

A related butadiene development of 1940 was announced by W. L. Semon of Goodrich Rubber Co. A co-polymer was made from butadiene and other substances such as those named above by first emulsifying the mixture with soap, then heating. The ingredients react to form a liquid similar in appearance to rubber latex and similar also in the manner of processing.

"Butacite," a plastic layer for safety glass characterized by extreme flexibility under impact, made its appearance on 1940 motor car models in the United States

First synthetic rubber factories approved by the U.S. government after Pearl Harbor began production in 1943. A sample is shown being cut from a cube of synthetic rubber

Butyl rubber was another achievement of 1940. It was announced by P. K. Frolich and co-workers of the Standard Oil Development Co. (N.J.). As before, butadiene was used, but not as the chief ingredient. Essentially this rubberlike material is made by polymerizing olefines. Only a small amount of butadiene (a diolefine) is added. As a matter of fact, the olefine gas isobutylene may be polymerized without butadiene to yield a "polyisobutylene" which is rubberlike because the molecules in the polymer consist of 500 to 5,000 isobutylene units. This polyisobutylene is essentially a saturated hydrocarbon, inert toward ozone, nitric acid or sulphur and hence incapable of vulcanization. If just enough butadiene gas is mixed with the original isobutylene gas to provide for sufficient unsaturation in the polymerized mass so that it can be vulcanized, the resulting product is butyl rubber. When cured, it is devoid of unsaturation and is as inert chemically as the polyisobutylene. It is more stretchable, however, than the rubber from trees. Butylrubberserves excellently as the material for inner tubes.

Isobutylene is a gas produced during the cracking of petroleum. It may be prepared also by pyrolysis of isobutane, an important ingredient of natural gas. Normal butane, also in natural gas, may be rearranged into isobutane by appropriate catalysts at high temperatures, and in the presence of other catalysts it may be changed by dehydrogenation into butadiene. Thus, natural gas and petroleum became materials for a new synthesis of rubber.

World War II was responsible for an unprecedented development in synthetic rubber, primarily of the butadienestyrene variety. The first plants to get into operation produced butadiene from alcohol. A mixture of alumina and zinc oxide was proposed as a suitable catalyst for this reaction. About a year later this process was supplemented by the procedure for making butadiene from petroleum.

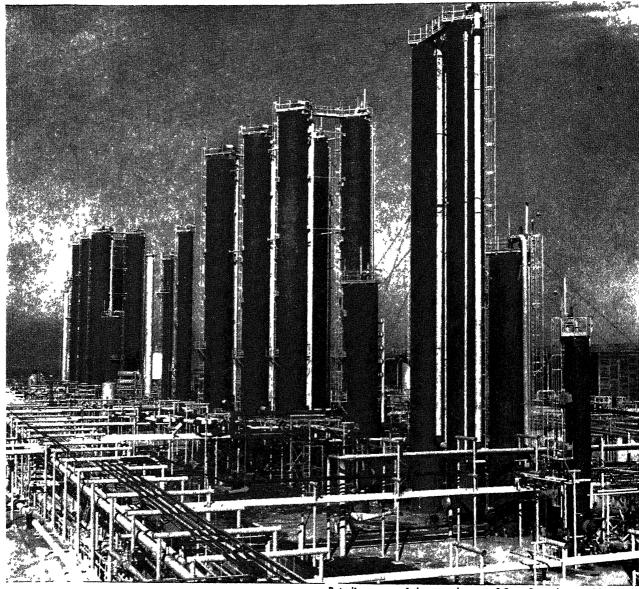

The steps employed in converting butadiene into syn-

thetic rubber briefly are these: (1) mix butadiene with styrene and emulsify the mixture in water in the presence of soaplike substances; (2) add a polymerizing agent such as benzoyl peroxide to the emulsion, and heat while stirring for 10 or 15 hours at 60° C.; (3) coagulate this synthetic rubber latex by addition of acetic acid or salt solutions; (4) collect the coagulated material and work it up on a rubber mill.

During 1945 synthetic rubber plants in the United States for government rubber containing styrene (GR-S) had an estimated capacity of 1,000,000 tons. In contrast, the best German annual production was about 17,000 tons. About one-third of the butadiene for the U.S. production came from alcohol, the remainder from petroleum. Butadiene from petroleum might cost 6.4 cents per lb., whereas that from alcohol was estimated at not less than 9 cents.

Refinery gases, the butanes and butylenes, were the chief source materials. The undesired isobutylene was selectively polymerized by sulphuric acid into diisobutylene, useful for aviation gasoline. The desired 1- and 2-butenes were separated from the butanes by azeotropic distillation with furfural or acetone through huge columns containing 75 bubble trays, a column being on the order of 200 ft. high and 13 ft. in diameter. These butenes, mixed with steam to give a hydrocarbon partial pressure of 1 to 2 lb. per sq.in. absolute, were passed over a catalyst at 620° C. The conversion to butadiene per pass was about 25%, and separation of the butadiene was by means of azeotropic distillation with furfural or extractive distillation with cuprous ammonium acetate. The catalyst, as yet undisclosed in 1946, was regenerated periodically with hot steam which removed the carbon as carbon monoxide.

Conversion of butane to butadiene may follow either a two-step (butane to butene to butadiene), or the Houdry one-step process. Two plants were using the latter in 1945. The process called for a chromia-alumina catalyst at 595° C. and 1.5-lb. pressure. Every 7 to 15 minutes the carbon deposit on the catalyst burned off with air.

Butadiene, one of the co-polymers of Buna-S synthetic rubber, was produced from normal butane in 1945, at this U.S. government-owned plant operated by Phillips Petroleum Co.

Other Rubberlike Products.—During the rubber shortage of World War II many materials unlike rubber chemically, but with rubberlike properties, were developed. Thiokol was one such material. It is a reaction product of sodium polysulphide and ethylene chloride. This was the most oil resistant of the rubbers. Koroseal, another rubberlike substance, was made by polymerizing vinyl chloride and incorporating a suitable plasticizer such as tritolyl phosphate.

Industrial Production of Nitroparaffins.—Nitroparaffins such as nitromethane or nitropropane had been known for many years but had been curiosities, hard to prepare and with no uses. Then laboratory experiments by H. B. Hass at Purdue university, Lafayette, Ind., showed that these substances could be made by direct nitration of the hydrocarbons in natural gas, if performed at elevated temperatures in the vapour phase. Production of nitroparaffins industrially was started during 1941 by Commercial Solvents corporation in their plant at Peoria, Ill. In view of the cheapness and availability of natural gas as a raw material in 1941, and in view of the remarkable properties of the nitroparaffins, this development represented an important milestone in industrial chemistry. Nitromethane, CH₃NO₂, is a liquid whose boiling point is about the same as water.

Many uses for it as a solvent had been reported by 1946. The condensation of nitromethane with aldehydes in the presence of alkalis yields nitro alcohols. Formaldehyde, for example, yields trihydroxymethylnitro-methane (HOCH₂),-CNO₂. The trinitrate of this alcohol is valuable as an explosive. The properties of the esters of these nitro alcohols were reported in 1941 by John B. Tindall.

Nitroparaffins, although insoluble in water, dissolve readily in alkali. When chlorine is passed into such a solution, chloronitroparaffins are formed immediately. Trichloronitromethane is the well known chloropicrin.

Another reaction of nitroparaffins is their behaviour toward mineral acids; 1-nitropropane, for example, when treated with sulphuric acid changes into propionic acid and hydroxylammonium sulphate. This provided a cheap source of hydroxylamine for the first time, as well as an independent source of propionic acid.

Kenneth Johnson and E. F. Degering of Purdue university discovered that 80%-85% yields of propionalde hyde or butyraldehyde may be formed by adding the sodium salt of 1-nitropropane or 1-nitrobutane to cold,

dilute sulphuric acid. Coupling of the nitroparaffins with aromatic diazo compounds produced azo dyes, one such being phenylazonitropropane, $C_6H_5N=NC\ (CH_3)\ _2NO_2$. Such substances dye wool or silk directly and are applicable to cotton if the coupling is performed on the fabric.

An ingenious method of analysis for mixtures of nitroparaffins by infra-red spectroscopy was reported by J. R. Nielsen and D. C. Smith of the University of Oklahoma, Norman, Okla. The basis of the method was to find, from the spectra of the pure components (nitromethane, nitroethane, 2-nitropropane, 1-nitropropane) a set of wave lengths such that at each wave length only one component shows strong absorption while the others show weak absorption. For the four nitroparaffins mentioned, these bands were located, respectively, at 10.90, 10.06, 11.74, 8.15 microns. Only a few minutes were required for each analysis, and accuracy was within 0.1%. R. B. Barnes and co-workers of the American Cyanamide company were active in developing infra-red spectroscopy as a tool for the analysis and control of synthetic rubber.

Thiophene.—Search for a new method of making butadiene from butane guided chemists at the Socony-Vacuum laboratories to the discovery of a practical synthesis of thiophene. They reasoned that sulphur at sufficiently high temperatures might pull away the hydrogens of butane, to form butadiene and hydrogen sulphide. The reasoning was good because a substantial amount of butadiene was isolable under certain conditions, but the method proved to be much more attractive as a source of thiophene. A yield of 70% (by recycling) was obtainable by heating a mixture of one part of butane with 1.5 parts of sulphur at 650° C. for one-tenth of a second, followed by quick cooling. The conversion per pass was 20%–24% based on butane.

Thiophene, C₄H₄S, had been primarily of interest as the impurity (0.1%) in coal-tar benzene. It was fairly well studied in the six decades after its discovery, but never with anything but academic motives. Industrial utilization seemed assured at the end of the decade 1937–46.

Thiophene resembles benzene in that it displays conventional substitution reactions with bromine, chlorine, nitric acid, or sulphuric acid; but the greater reactivity of thiophene is noteworthy. Its reactions with mercuric salts, or ethylmagnesium bromide, or acid chlorides in the presence of stannic chloride all contrast to the corresponding nonreactions with benzene. F. S. Fawcett and H. E. Rasmusson, working with purer thiophene than was hitherto available, found its boiling point to be 84.1° C. and its melting point -38.5° C.

Synthetic Plastics and High Polymers

Plastics fall into two broad classes; those made from high molecular weight materials (cellulose acetate, cellulose nitrate, ethylcellulose) and those made from low molecular weight substances by reactions of polymerization or condensation. Ethylcellulose was introduced industrially during the decade 1937–46. Polyvinyl butyral is another plastic made from a high polymer, namely, from polyvinyl alcohol and butyraldehyde. Originally developed for use in laminated safety glass, its output served other purposes during 1942–44, such as waterproof raincoats.

Polyvinyl acetate illustrates the other group of plastic materials. Vinyl acetate, vinyl chloride and similar compounds of the structure CH₂=CHX are known to polymerize by opening of the double bond so that a chain of this nature is formed, -CH₂-CHX-(CH₂-CHX-)_n-CH₂-CHX-, in which n represents a large number. The end groups of these long polymer chains are usually not well understood, but the work of C. S. Marvel and G. E. Inskeep

of the University of Illinois, Urbana, Ill., gave new information on the structure of the end group of polyvinyl alcohol. This polymeric alcohol is produced by alkaline hydrolysis of polyvinyl acetate. During this process an irregular change was noted in the molecular weight of the polymer, which was explained by assuming that polyvinyl alcohol has one terminal aldehyde group, the structure of which may be visualized as –(CH₂–CHOH)_n–CH₂CHO. Under acid conditions this terminal aldehyde group can react with neighbouring hydroxyl groups, and under alkaline conditions the aldehyde function may condense with a similar function, giving rise to molecules of quite different molecular weight.

For polyvinyl chloride, X in the above structure is Cl; for polyvinyl acetate, it is OCOCH₃; for polystyrene, it is phenyl or C₆H₅; for methyl acrylate polymer, it is COOCH₃; for acrylonitrile polymer, it is CN; for the allyl polymers, it is CH2OR wherein R represents a vari ety of bifunctional radicals. Vinyon contains large amounts of polyvinyl chloride. Styron is polystyrene. Lucite and plexiglas are composed of methyl acrylate and methyl methacrylate polymers. The transparency of styron, lucite, and plexiglas is the basis for many uses. A "hardened" lucite, better for abrasion resistance, is made by incorporating a few parts of acrylic or methacrylic anhydride to the methyl methacrylate during its polymerization. Still more resistant to abrasion is the transparent allyl resin, CR-39, developed by Columbia Chemical division of Pittsburgh Plate Glass company. Saran, or polyvinylidene chloride, was a development of Dow Chemical company. It is made by polymerization of vinylidene chloride, $CH_2 = CCl_2$. The plastic is tough. Pipes of it may be welded readily by heating the ends to 175° C. Noncorrosive Saran screens came into use in 1945. Polyethylene (-CH2-CH2-) n is a high polymer, made by heating ethylene (C2H4) under very high pressure in the presence of a trace of oxygen.

Another large group of resins is made by condensing two different molecular species, usually by loss of water as the reaction progresses. Such resins include the alkyd type which start with phthalic anhydride and glycols, the phenolics such as bakelite, which are compounded from phenol and formaldehyde, the urea and melamine resins which also require formaldehyde, and nylon which is the polyamide resulting from interaction of a diamine with a dicarboxylic acid. These high polymers find wide application in varnishes, moulded pieces, textiles and many other uses.

Structure of Natural Products

Steroids.—Between 1935–40 the chemistry of the sex hormones was elucidated and shown to be related to that of sterols (cholesterol, ergosterol), bile acids (cholic acid, desoxycholic acid), and the digitalis group of heart stimulants, which had been worked out a few years before. These compounds were shown to contain a common nucleus related to cyclopentenophenanthrene.

In 1934, during the course of experiments on male urine, A. Butenandt isolated two male hormones, namely, androsterone, C₁₉H₃₀O₂, and dehydroandrosterone, C₁₉H₂₈O₂. Interest in this work was stimulated in 1935 by L. Ruzicka's synthesis of androsterone from cholesterol. The steps required two catalytic reductions and an oxidation. Later, Russell E. Marker *et al.* simplified this synthesis and announced the preparation from cholesterol of 3-chloro-5-dehydroandrosterone from which either of the naturally occurring male hormones (androsterone, dehydroandrosterone, or testosterone) were obtainable. These investigators also

synthesized estrone, a female hormone, from ergosterol. The hormone from corpus luteum, known as progesterone, is the active principle essential for pregnancy. It was isolated in crystalline form through the work of W. M. Allen, Oskar Wintersteiner and G. W. Corner.

Search for synthetic compounds with estrogenic properties led to the discovery of trans-diethylstilbestrol, $HOC_6H_4-C(C_2H_5) = C(C_2H_5)-C_6H_4OH$, so named because of the structural relationship to the hydrocarbon stilbene. It was more potent than estrone and nearly as powerful as estradiol. This result was reported by E. C. Dodds and Robert Robinson of England. Activity is lessened, according to E. E. Reid and Edith Wilson, if the phenolic hydroxyl groups in this compound are changed to ether groups.

Marijuana.-Hemp fibre had long been used for rope and clothing. Hemp seeds had been pressed for oil. The hemp plant also produces "marijuana," a term that includes any part of the plant (genus, Cannabis) or extract therefrom which brings about intoxication in man. In 1940 Roger Adams and collaborators at the University of Illinois isolated and determined the structure of the active substance in the plant.

Between the period when the female plant (Cannabis indica) is about to flower and until the seeds are mature, the hairy tops contain a sticky resin. Some resin is obtainable also from the male plant but in much smaller quantity. The resin contains the intoxicating principle of the plant. Plants grown in hot dry climates such as Chinese Turkistan produce much more resin than those grown in moist, temperate climates.

The resin of the hemp plant itself may be extracted with light petroleum. From the red oil thus obtained two compounds called cannabidiol and cannabinol were isolated. These accounted for three-fifths of the oil but explained none of its activity, since they are inert physiologically. The other two-fifths probably contain tetra- and hexahydrocannabinols which have demonstrated potency.

Chemically, it was established that cannabidiol is a substituted biphenyl. One of these phenyl groups has a pentyl radical in position 4 and phenolic hydroxyls in positions 2, 6. The other phenyl group is really tetrahydrophenyl, and it is substituted by α -methylvinyl in position 2 and methyl in position 5. The two phenolic functions explain the suffix "diol" in the name cannabidiol. This compound, as mentioned above, is inactive physiologically, but on treatment with acidic reagents it isomerizes smoothly to a new substance, tetrahydrocannabinol, which has very high marijuana activity. All that happens chemically in this change is addition of one of the phenolic hydroxyls to the methylvinyl group, thereby forming a new 6-membered oxygencontaining ring which is shared jointly by the two preexisting phenyl rings.

Cannabinol resembles tetrahydrocannabinol structurally but not physiologically. Loss of the four hydrogens brings about loss of the marijuana activity. Roger Adams demonstrated the dehydrogenation of tetrahydrocannabinol to cannabinol in laboratory experiments and suggested that reactions in the hemp plant might be similar.

Cork.-N. L. Drake and collaborators at Maryland reported during 1941 results of investigations extending knowledge of the composition of cork. Sitosterol had been identified definitely. Phellonic acid, another ingredient, had been shown to be 22-hydroxytetracosanoic acid; i.e., a 24-membered straight chain hydroxy acid wherein the hydroxy group is on the 22nd carbon from the terminal acid carbon. Paraffin hydrocarbons, C11H44 to C31H84, had been characterized also. Most of Drake's work, however, had dealt with the elucidation of the structure of friedelin, a cork substance isolated many years before and named in honour of the famous French chemist, Charles Friedel. His work proved that friedelin, C₃₀H₅₀O, is a pentacyclic unsaturated ketone. Twenty-two of the 30 carbons make up the five rings. These were thought to be staggered in the manner of phenanthrene or picene since, on drastic dehydrogenation with selenium dioxide, 1,2,8-trimethylphenanthrene and 1,8-dimethylpicene were obtained.

Quercitrin.-Prior to the advent of synthetic organic dyestuffs, the three most important vegetable dyes were indigo from the stalk and leaves of the indigo plant, alizarin from madder root, and quercitrin from oak bark. J. D. Guthrie and collaborators of the Southern Regional Research laboratory found in 1944 that quercitrin may be isolated from goldenrod leaves by extracting the dried leaves with acetone. Seven per cent of the acetone-soluble

matter proved to be pure quercitrin.

Vitamin B₁ or Thiamin.—This antineuritic vitamin was separated from its natural sources and its structure established prior to 1938 by Robert R. Williams and co-workers. For this achievement Dr. Williams was honoured as the 1938 recipient of the Willard Gibbs medal in chemistry. Rice polishings are a rich source of this vitamin, but its rarity is evident when it is realized that only about 20 grams is present per ton of the chaff. By the best process of tedious extraction, about five grams per ton is actually isolable. This vitamin, isolated in this manner as a hydrochloride, is crystalline, and analysis revealed 12 carbon atoms in the molecule. On treatment with sodium sulphite and sulphurous acid, it was split into two parts, each containing six carbon atoms. One of these units was a pyrimidine and the other a thiazole. The nitrogen atom of the thiazole was the point of attachment to the pyrimidine. Synthesis of this vitamin was the direct consequence of this analytical information.

Vitamin B₆.—Another vitamin, associated with B₁ in rice chaff is B6. Its identity was revealed in 1939. Vitamin B₆ represents that factor of the vitamin B complex which prevents or cures an acrodynialike dermatitis in young rats. Also, severe microcytic hypochromic anaemia develops in puppies when the rat antidermatitis factor is apparently the only missing component of the diet.

A group of chemists from the laboratories of Merck and Company (S. A. Harris, Karl A. Folkers, E. T. Stiller, J. C. Keresztesy and J. R. Stevens) not only established the structure of this vitamin but also synthesized it. The vitamin is 2-methyl-3-hydroxy-4,5-bis(hydroxymethyl)pyridine, CH₃ (HO) C₅HN (CH₂OH) 2. Oxidation of the CH₂OH groups to COOH groups, yielding 2-methyl-3-hydroxy-4,5pyridinedicarboxylic acid, was important evidence in solving the structure. Its synthesis was effected, starting with ethoxyacetylacetone and cyanoacetamide. R. Kuhn and co-workers in Germany announced the same structure in independent work. R. E. Eakin and R. J. Williams and also A. S. Schultz, L. Atkin and C. N. Frey showed that crystalline vitamin B₆ is a growth-promoting factor for yeast.

Vitamin K.—After 1930 investigators reported a bleeding tendency in chickens reared on artificial diets. In 1935, Henrik Dam and Fritz Schonheyder of Copenhagen reported that the deficiency factor causing the haemorrhages was a fat-soluble substance. Dam named it vitamin K (Koagulations-vitamin). Bioassay methods were developed by Dam, by H. J. Almquist in California, and by E. A. Doisy in St. Louis, Mo. Dried alfalfa leaf meal and putrefied sardine meal proved to be satisfactory sources of K. By 1937, Almquist had perfected a process for extracting the antihaemorrhagic vitamin from dried alfalfa with hexane.

The use of vitamin K in obstructive jaundice was proposed by Armand J. Quick of Milwaukee, Wis., in 1937 on theoretical grounds. Later it was established that the bleeding tendency or lack of blood clotting so often seen in patients having biliary fistulas or obstructive jaundice is due to abnormal lowering of the plasma prothrombin level and that usually the bleeding tendency can be relieved by vitamin K therapy.

In 1939 several groups of investigators attacked the chemical side of the problem. Besides Doisy, Almquist and Dam, the groups included B. Riegel and co-workers of Northwestern university and elsewhere, Erhard Fernholz of the Squibb laboratories, Richard Kuhn of Germany and R. J. Anderson of Yale. It was Doisy's group that announced the isolation of crystalline vitamin K from alfalfa extract. By chemical reactions and ultra-violet absorption spectra they established it as a derivative of naphthoquinone. Oxidation experiments showed that it was probably 2-methyl-3-phytyl-1,4-naphthoquinone and this was confirmed by synthesis. The phytyl group, which is found also in chlorophyll, is H-[CH₂CH (CH₃) CH₂CH₂]₃-CH₂C (CH₃) = CHCH₂-, or simply C₂₀H₃₈-.

Curiously enough, it was shown that the phytyl group was nonessential for the efficiency of the vitamin. Both 2-methylnaphthoquinone and 2-methyl-3-hydroxynaphthoquinone (known as "phthiocol") possess activities comparable to vitamin K.

Vitamin E.—This antisterility factor (as tested with female rats) occurs especially in the unsaponifiable portion of wheat-germ oil, corn-germ oil or lettuce oil. The phytyl group is present in its structure also. L. I. Smith and co-workers at Minnesota showed that here again the phytyl group is not a specific factor, for a considerable number of substances other than vitamin E also display vitamin E activity. This lack of specificity with vitamins E and K is striking since there are no substitutes for the other known vitamins which have been identified chemically.

Structure of Biotin.—A yeast-growth substance had been isolated by F. Koegl and named biotin. This substance which had also been named vitamin H by A. Szent-Gyoergyi, is the factor in yeast, liver and various foods which is capable of preventing the fatal symptoms resulting when animals are fed large quantities of raw egg white. The chemical identity of biotin was established during 1942, largely through the work of Vincent du Vigneaud and collaborators at Cornell University, Ithaca, N.Y., medical college. Although the role of biotin in nutrition was not fully understood, its effect in preventing death in rats fed on an egg-white diet was amazing, for as little as forty billionths of a gram per day $(0.04\nu, \text{ wherein } 1\nu = 0.001 \text{ mg.})$ was sufficient to prevent this kind of fatality.

Biotin, as extracted from liver extracts and milk concentrates by chromatographic adsorption, was a crystal-line compound, melting at 230° C., of the composition C₁₀H₁₆O₃N₂S. The structure of biotin was shown to have nine carbon atoms in a continuous chain, the first of these nine being an acid carbon (carboxyl). A sulphur atom joined atoms 6 and 9, whereas a urea residue joined atoms 7 and 8. The urea residue was recognized by alkaline hydrolysis, thereby giving rise to an analogous compound with two amine groups on atoms 7 and 8. Reaction of this diamine with phosgene regenerated biotin. Five of the nine carbons were shown to be –(CH₂) 4COOH because adipic acid, HOOC (CH₂) 4COOH was formed by destructive oxidation of biotin with nitric acid. The urea residue could not have involved atoms 1 to 5, because of

this oxidation evidence. This evidence, however, did not eliminate the possibility of attachment at 6,8 or 6,9 (rather than 7,8) but reaction of the diamine with phenanthraquinone did so. Such a reaction requires the two amine groups to be on adjacent carbon atoms, thereby substantiating the 7,8-position. Additional evidence in support of the structure of the diamine was afforded by its degradation to a thiophene derivative, namely, δ -(α -thienyl)-valeric acid, by indirect loss of two equivalents of ammonia.

Pantothenic Acid.—This vitamin, when tested on microorganisms, serves as a growth stimulator. It is made from β -alanine, NH₂CH₂CH₂COOH, and 2-hydroxy-3,3'-dimethylbutyrolactone, HOCH-C (CH₃) 2-CH₂. Roger J.

Williams of Texas was particularly active in this development. Knowledge of the structure of pantothenic acid stimulated work on the preparation of compounds of analogous structure by Jean Barnett and F. A. Robinson. They selected five other lactones, and they also substituted four other amino acids for β -alanine without being able to obtain a product in any case which would replace pantothenic acid as a growth stimulator. These workers, as well as another group of workers headed by R. Kuhn, obtained a reaction product between 2-hydroxy-3,3-dimethylbutyrolactone and taurine, which product was highly inhibitory to Streptococcus haemolyticus. This is the opposite effect to that shown by pantothenic acid. Taurine, $NH_2CH_2CH_2SO_3H$, differs from β -alanine by having a sulphonic acid group in place of a carboxylic acid group. In passing, it may be mentioned that A. A. Goldberg provided a new synthesis of taurine from 2-aminoethanol by conversion of it to 2-aminoethyl hydrogen sulphate, and reaction of the latter with hot aqueous sodium sulphite.

New Medicinals

Sulfa Drugs.—In 1936 sulfanilamide was an obscure chemical with no uses. Very little if any of it was manufactured during that year, but more than 267,000 lb. were produced in 1937, the year of its introduction to medicine. Its effect in curing bacterial infections stimulated research activity in the hope of finding still more effective drugs of this type. Sulfapyridine, sulfathiazole and sulfasuxidine were discovered during this search. The structure of sulfanilamide is $H_2N-C_6H_4-SO_2NH_2$. Sulfapyridine is $H_2N-C_6H_4-SO_2NH_2$. Sulfapyridine is $H_2N-C_6H_4-SO_2NH_2$. Sulfapyridine are similar.

Penicillin.—The beneficial effects of certain kinds of bacterial products in combating disease had long been known. Pasteur showed in 1877 that Bacillus anthracis, which causes the disease anthrax, can be repressed by other micro-organisms. The French physician Felix Hubert d'Herelle in 1917 expanded the work of a British bacteriologist, F. W. Twort, and developed means of producing an active substance by bacterial growth which he named bacteriophage, a substance of low toxicity and of considerable commercial importance, but with the drawback of being too specific for general use.

It was Alexander Fleming of London, working with cultures of certain strains of staphylococci in 1929, who discovered that a certain green mould was able to destroy the colonies of staphylococcus on an agar plate culture. The green mould was found to be a species of fungus known as *Penicillium notatum*. The filtrates from the cultures of this mould were found to have strong germicidal activity, and Fleming named the material penicillin. Fleming's findings were reinvestigated and expanded in

1940 by an Oxford group of investigators headed by E. P. Abraham, E. Chain and H. W. Florey. Shortly thereafter, Florey visited America to interest the United States government and several commercial laboratories in undertaking the commercial production of penicillin. His mission was successful, and the year 1943 witnessed the building of new plants in at least 18 interested companies, the two largest of which were Charles Pfizer and company, and Commercial Solvents corporation. By 1945 penicillin production was big business. The 1945 production was valued at about \$100,000,000,000, despite the drop in wholesale price from \$20 to 60 cents for 100,000 units.

Deep-culture technique and improved strains of moulds were the two major factors responsible for the remarkable growth of this industry. Penicillin is by no means a cureall, but the miracles it has performed are too well known for comment. At first it was necessary to store penicillin in refrigerators to avoid rapid deterioration, but Commercial Solvents corporation later placed a crystalline sodium salt of penicillin on the market capable of maintaining its high potency indefinitely at ordinary temperatures.

Late in Dec. 1945 the Committee on Medical Research, Office of Scientific Research and Development, representing 21 U.S. research organizations, and the Medical Research council, London, representing 17 British laboratories published a summary of principal findings on the structure of penicillin secured up to the end of 1944. Several antibiotics of the penicillin class had been found, all possessing the general formula, RCO-NH-(C7H9ONS) -COOH. In what is known as F-penicillin (or penicillin-I in Britain) the RCO group is 3-hexenoyl, or CH₃CH₂CH = CHCH₂CO-; in G-penicillin (or penicillin-II) it is phenylacetyl or C6H5CH2CO-; in X-penicillin (or penicillin-III). p-hydroxyphenylacetyl, or HOC₆H₄CH₂CO-; in Kpenicillin it is caprylyl, C7H15CO-. These structures explain the formation of phenylacetic acid, p-hydroxyphenylacetic acid, etc., as hydrolytic products of penicillin. K-penicillin is less desirable than the others since it is rapidly destroyed in the body. As a matter of fact, the other penicillins are largely excreted in the urine.

Acid hydrolysis of penicillin was found to yield penicillamine, characterized as D- β , β -dimethylcysteine, HSCMe₂ CH (NH₂) COOH. Unstable "penaldic acids," RCONH-CH (COOH) CHO, were formed concurrently and these decomposed readily into "penilloaldehydes," RCONHCH₂ CHO. Thus, G-penilloaldehyde is phenylacetamidoacetal-dehyde.

A thiazolidine structure (I) containing a beta lactam

configuration explains these and subsequent results and was receiving most active attention in 1945-46 as the structure for penicillin. Opening of the 4-membered lactam ring by alkaline hydrolysis gives rise to salts of a dicarboxylic acid named penicilloic acid. The penillic acids (II) are obtained by holding penicillin at 30° C. in dilute mineral acids. Treatment of the penillic acids with

COOH
$$CH S CH SH$$

$$N CH C(CH_3)_2 N CH C(CH_7)_2$$

$$RC N CHCOOH RC N CHCOOH$$

$$(III)$$

mercuric chloride is a method used to open the S-containing ring. Carbon dioxide is detached in this process and penillamines (III) are formed. Although the synthesis of penicillin was not announced, it appeared clear that the groundwork was established for an understanding of most of its chemistry.

Streptomycin.—Another antibiotic which received prominence during the latter part of the decade was streptomycin, which in contrast to penicillin is effective toward the gram negative bacteria. It seems to be particularly effective toward tularaemia and urinary infections. Not much of it was produced, and less was known concerning its structure than penicillin, but Karl Folkers and coworkers at Merck and company made progress in structural studies. They concluded that it has the general constitution of a hydroxylated base named streptidine which is attached through a glycosidic linkage to a nitrogen-containing disaccharide-like molecule. The latter contains a methylamino group and a carbonyl group. The formula of streptomycin is considered to be either $C_{21}H_{37}N_7O_{12}$ or $C_{21}H_{39}N_7O_{12}$. Streptidine is $C_8H_{18}N_6O_4$.

Dicoumarin.—In 1941 K. P. Link of the University of Wisconsin, Madison, Wis., discovered that the compound known as 3,3-methylenebis- (4-hydroxycoumarin) occurred in improperly cured clover. When such food was ted to cows they developed a bleeding ailment which was often fatal. Link's compound, familiarly known as "dicoumarin," was shown to be the causative agent of this disease. Solution of this problem led to studies on its possible therapeutic use in humans in rendering blood less coagulable so as to offset the danger of blood clots after surgery. This work was still in the clinical stage in 1946, but results on several hundred patients were gratifying.

In studies reported after 1943, Link and collaborators extended the chemistry of this type of compound. The starting point in the synthesis is methyl salicylate, or oil of wintergreen. This, on treatment with acetic anhydride, is converted into methyl acetylsalicylate, which changes into 4-hydroxycoumarin by an intramolecular condensation The best conditions found made use of an inert solvent (a mineral oil), metallic sodium as the condensing agent, and a temperature of 250° C. Reaction of 4-hydroxycoumarin with formaldehyde completes the synthesis.

Antimalarials.—Curtailment of the supply of quinine during World War II gave a tremendous impetus to a search for new antimalarials.

The chemistry of quinine itself came into the spotlight during 1944 because of its first total synthesis by R. B. Woodward and W. E. Doering working at Harvard university, Cambridge, Mass. One of the stumbling blocks in previous attempts at synthesis was the unsaturated vinyl group (CH₂=CH-) which is necessary. In 1941 this was created as 3-vinyl-4-piperidine propionic acid. This oxime was obtained from 7-hydroxyisoquinoline by steps involving methylation, hydrogenation, oxidation and nitrosation. The vinyl compound was converted to quinotoxine by condensation with ethyl quininate. This completed the synthesis, since P. Rabe had shown in 1918 that quinine could be made from quinotoxine.

This synthesis of quinine was widely heralded in the press. It must be admitted that this was due to the prominence of quinine as a drug rather than to any consideration of the chemical method of approach. Unfortunately, however, the starting point was the relatively inaccessible 7-hydroxyisoquinoline, from which it required 18 steps merely to reach quinotoxine. There seemed to be no justification for hoping that the industrial synthesis

em 60

Atebrin was made in vast quantities during the war years, but not much plasmochin was made in view of the greater hazard attending its use. The Committee on Medical Research of the OSRD surveyed more than 16,000 other compounds as potential antimalarials. This need was real because neither quinine nor atebrin cured malaria permanently if the disease was of the Plasmodium vivax variety. One of the best of the new compounds was listed as Survey No. 7618. Although more efficient than atebrin in every way, it also failed to give permanent cures for P. vivax. This substance is 4-alkylamino-7-chloroquinoline, in which the alkyl group is the same 1-methyl-4diethylaminobutyl group found in atebrin or plasmochin. Some of the substituted 8-amino-6-methoxyquinolines, related to plasmochin but safer and more efficient, gave promise of effecting not only temporary but also permanent cures for malaria.

Insecticides and Weed Killers.-A chemist, Othmar Zeidler of Strasbourg, France, discovered in 1874 that chloral and chlorobenzene, when brought together in the presence of sulphuric acid, underwent reaction with the formation of a solid melting at 105°. The name of the solid is 2,2-bis- (p-chlorophenyl) -1,1,1-trichloroethane, nicknamed DDT. As so often happens in chemistry, a startling unsuspected use was announced for a substance discovered many years before. Sulfanilamide was such a compound, its medical properties being unsuspected till many years after its discovery in 1909. Now Zeidler's compound was achieving fame 70 years after its discovery. Its value as an insecticide was demonstrated in Switzerland in 1939. Mosquitoes, flies, bedbugs and lice were included in the large group of insects which were killed a few hours after contact with this material.

One of the modifications of benzene hexachloride, known as the gamma isomer, rivalled DDT in importance as the most efficient insecticide. This substance results from addition of chlorine to benzene.

That 2,4-dichlorophenoxyacetic acid is capable of destroying weeds without damaging most grasses (clover and creeping bent are exceptions) was a welcome modern development to home owners who had struggled against dandelions. The chemical is a plant hormone which functions by attacking plant roots.

Carbohydrates

Sucrose.—The synthesis of sucrose had attracted the ingenuity of the chemist for a long time, but two stumbling blocks had made the task extraordinarily difficult. One was the furanose ring in the fructose portion of the sucrose molecule, and the other was the fact that both the glucose and fructose units might become attached in α or β configurations, thereby pointing to several isomeric possibilities in any synthesis.

No unchallenged synthesis of sucrose had yet been achieved by purely chemical methods at the end of the decade, but an interesting synthesis by an enzymatic method was developed in 1944 by W. Z. Hassid, M. Doudoroff and H. A. Barker. These investigators placed glucose 1-(dihydrogen orthophosphate) with fructose in the presence of sucrose phosphorylase from the bacterium *Pseudomonas saccharophila*. Since sucrose was formed directly, this reaction medium brings about the essential change of the fructopyranose to the fructofuranose ring.

Carbohydrate Configuration.—Two relatively new reactions of sugars were applied frequently in 1939. One was the oxidation with lead tetraacetate. This reagent cuts the carbon-carbon bond of a glycol structure (-CHOH-

CHOH-). If the other hydroxyl groups of carbohydrates are protected against such cleavage, as by changing them to ethers or acetals, controlled scission occurs. In this way, H. O. L. Fischer prepared isopropylidene-L-glycerose and isopropylidene-D-glycerose from the 1,2,5,6-diisopropylidene derivatives of L-mannitol and D-mannitol, respectively. Similarly, Hockett severed the 4-carbon chain of methyl erythroside into 2-carbon units, and the 6-carbon chain of methyl L-fucoside into 3-carbon units.

Periodic acid cleaves the glycol portion of a carbohydrate in much the same way. In the hands of C. S. Hudson this proved to be a powerful tool for the determination of ring size and asymmetric configuration. Mannose, trehalose, levoglucosan and higher carbohydrates were also investigated in this manner.

Distillation of Sugars.—When sugars are heated they undergo caramelization and charring. Distillation in the customary sense is impossible. This is one of the reasons why experimentation with carbohydrates is difficult. Syrups which resist crystallization have been particularly troublesome to characterize, and these include malt syrup, honey, corn syrup, "hydrol" and others.

Carbohydrate mixtures may be separated by converting them to methyl ethers which are distillable. The unfortunate part of this operation, however, is that with disaccharides (sucrose, maltose, lactose) or trisaccharides (raffinose, melezitose) there is no way to regenerate the sugars from the ethers without destroying the sugar itself.

This difficulty was solved by Charles D. Hurd, K. M. Gordon and R. W. Liggett of Northwestern university in 1941. They converted the sugars to propionic esters by the action of propionic anhydride and pyridine. Such propionates were found to be distillable, even from the trisaccharides, at temperatures between 160° and 300° C. if the pressure was lower than 0.001 mm. of mercury. In this way, propionates of mono-, di- and trisaccharides could be collected in separate fractions. Mild alkaline treatment was found to remove the propionate groups and bring about regeneration of the sugar itself. Identification of the sugar in this purified state would follow the customary procedures. The fact that many of the sugar propionates were crystalline solids was helpful also in characterization.

Separation of Sugar Mixtures by Adsorption.-W. S. Reich's work in 1939 showed that p-phenylazobenzoates of glucose and fructose were separable by a preferential type of adsorption on alumina or silica. Since the layers of adsorbed material are coloured and therefore visible, the process is known as chromatographic adsorption. G. H. Coleman of Iowa extended this in 1942 to a working process for the separation of glucose from sucrose, fructose from galactose, lactose from sucrose, maltose from glucose and others. As might be expected, some other carbohydrate pairs did not give satisfactory separation. M. L. Wolfrom of Ohio State university, Columbus, O., showed that colourless acetates of sugars could be separated in much the same way. His method of locating the different carbohydrate zones was by streaking the extruded adsorbent with permanganate solution.

Other Reactions.—The reaction of glucose at 70° with alkylamines (butylamine, pentylamine, heptylamine, octadecylamine, ethylenediamine, etc.) in the presence of a little of the amine hydrochloride gives rise to glucosylalkylamine by exchange of the hemi-acetal hydroxyl of glucose for the amine group. Hydrogenation of these compounds in the presence of activated nickel opens the

oxygen bridge to produce "glucamines," HOCH₂(CHOH),-CH₂NHR, in good yields. This was reported by R. M. Hixon of Iowa State college, Ames, Ia.

An intermediate in the synthesis of riboflavin, namely, N-D-ribityl-3,4-dimethylaniline was prepared in the following way by M. Tishler et al. from D-ribonolactone. First it was converted to D-ribon-(3,4-dimethylanilide) by heating with 3,4-dimethylaniline. After acetylation of the four hydroxyl groups this anilide (RCONHAr) was changed to its imido chloride (RCCl=NAr) by treatment with phosphorus pentachloride. Hydrogenation of the imido chloride was effected with palladium catalyst (to RCH2NHAr). The final step was deacetylation by sodium methoxide.

The commercial availability of the nitroparaffins stimulated work with them in the carbohydrate field. Attachment of a nitro group to the carbohydrate skeleton was accomplished in a very ingenious manner by J. C. Sowden and H. O. L. Fischer of Toronto. Nitromethane condenses readily with an aldehyde in the presence of a base to form a nitro alcohol: RCHO + $CH_3NO_2 \rightarrow RCHOHCH_2NO_2$. Sowden and Fischer made use of the familiar Wohl degradation to produce the aldehyde in statu nascendi for this condensation. This may be visualized in a simplified presentation of their process. Let R (CHOH) CHO represent glucose. Its oxime, R(CHOH)CH=NOH, is acetylated and dehydrated by acetic anhydride to the organic cyanide, R (CHOAc) CN. Alkaline treatment breaks this down to RCHO (a pentose), but in the presence of nitromethane this compound reacts to form 1-nitro-1-desoxymannitol, R (CHOH) CH₂NO₂.

During 1943-44 there was unusual activity in the field of methylene derivatives of sugars, especially in the laboratories of W. N. Haworth (England) and C. S. Hudson (United States). Both these investigators obtained these substances by reaction of a carbohydrate at its glycol functions with formalin or trioxymethylene in the presence of either hydrochloric or sulphuric acids. The work was concerned chiefly with derivatives of these carbohydrate materials: xylitol, adonitol, dulcitol, sorbitol, mannitol and methyl saccharate.

Starch and Cellulose.—T. J. Schoch of Corn Products Refining Co. made the novel discovery in 1941 that cornstarch could be separated fairly readily into two fractions by adding butyl alcohol to a 2% starch solution. About one-fifth of the starch solids separated. This material, known as "amylose" or the "linear fraction," is crystalline and gives an intense blue coloration with iodine. The unprecipitated portion, known as "amylopectin" or the "branched fraction," gives a red coloration with iodine. A 5% solution of amylose sets to a rigid gel, whereas a 5% solution of amylopectin remains a mobile liquid. Evidence supported the belief that the amylose molecule is composed of a chain of glucopyranose units, these glucose units being attached to each other usually through the 1, 4 positions but occasionally at the 1, 6 (or 1, 2) positions.

R. L. Whistler and G. E. Hilbert of the U.S. department of agriculture reported during 1945 that the triacetates of amylose and amylopectin differ greatly in film-forming ability. Brittle films are formed from amylopectin triacetate, much like the brittle films from completely acetylated whole starch. Amylose triacetate, on the other hand, readily forms films of good tensile strength and suppleness, resembling those made of cellulose triacetate.

At the Massachusetts Institute of Technology, Cambridge, Mass., C. Purves made an ingenious study of the distribution of the acetyl groups in a technical cellulose

acetate, which averaged 2.44 out of a possible 3 acetyl groups per glucose unit. Esterification of the remaining 0.56 hydroxyl group by toluenesulphonyl chloride and analysis of the groups introduced showed ratios of 23.4: 2.16: 0.106 for positions 6,2, and 3, respectively. That on position 6 could be determined by direct reaction with sodium iodide and positions 2,3 were estimated by mathematical analysis of the rates of esterification.

The positions of the ethyl groups in the incompletelyethylated technical ethylcellulose were shown to be about the same, namely, a ratio of 15: 2.3: 0.7 for positions 6, 2, 3. This means obviously that position 3 is most acetylated or ethylated in the technical operations, and position 6 is the most difficult to attack. Positions 2 and 3 are secondary and position 6 is primary.

E. C. Yackel, C. C. Unruh and W. O. Kenyon of Eastman Kodak company announced in 1942 that cellulose is preferentially attacked at position 6 by nitrogen dioxide. The oxidation converted the primary alcohol group to a carboxyl group in yields approaching the theoretical.

Developments In Inorganic Chemistry

Separation of Rare Earths.—Joseph K. Marsh of Oxford reported in 1943 that samarium might be separated from its neighbours, gadolinium or neodymium, by treatment of the acetates with sodium amalgam. Of these three elements samarium is the only one which is readily reduced to the metallic state. In a Sm-Nd mixture it was found possible to reduce the Nd-content from 70% to 0.01% in one step. Another common rare earth mixture which is easily purified by the sodium amalgam technique is that of ytterbium, lutecium and thulium. Only ytterbium acetate in a mixture of these three acetates reacts with sodium amalgam, hence its easy separation.

Traces of europium are often associated with ytterbium, and the work of P. W. Selwood of Northwestern university provided a simple method of obtaining the europium content. If these compounds are reduced to the bivalent state, Selwood found that practically complete precipitation of europous sulphate, EuSO₄, could be obtained by coprecipitation with barium sulphate, after which the europous sulphate could be removed by washing the precipitate with hot concentrated nitric acid. In this manner pure specimens of europium may be obtained in days rather than years, which were required previously by the tedious fractional crystallizations.

Organic Silicon Compounds.-E. G. Rochow and collaborators of General Electric Co. developed a new process for making organo silicon halides which proved to be especially useful in the preparation of dimethylsilicon dichloride (CH₃) ₂SiCl₂, namely, the interaction of methyl chloride with hot pellets of an alloy of silicon and copper (10% Si). Some methylsilicon trichloride and other products are formed concurrently. Interest in this compound stems from the unusual properties of the substance it yields on reaction with water. First the dihydroxy analog is produced (CH₃) ₂Si (OH) ₂, and it then undergoes intermolecular dehydration. One may visualize the first dehydration product to be of this structure: HO-Si (CH₃) 2-O-Si(CH₃)₂-OH, and the next HO-Si(CH₃)₂-O-Si (CH₃)₂-O-Si (CH₃) 2OH, and so forth. The extent of this dehydration may be controlled somewhat, so that the products formed may vary in physical properties from light liquids to rubbery solids. This process is known as "curing." A partly cured product may be cured further by heating to 400° C., or by using such dehydrating agents as sulphuric acid or boric acid. A methyl silicone rubber, thus prepared, has several thousand ([CH3]2SiO) -units in its molecule. This may be used at temperatures much higher than ordinary rubber could withstand. Another interesting application of these "silicones" was in electrical insulation. A wire wound with glass fibre and then impregnated with a partly cured silicone resin may then be cured at 400° C. to give a product which is remarkably durable at high temperature and of high dielectric quality.

Ion Exchangers and Zeolites.—Certain materials in the soil are called zeolites. These claylike substances include the glauconites, bentonites, or hydrated aluminum double silicates. They may occur as calcium salts in the soil but such zeolites tend to bind potassium or ammonium ions when potassium or ammonium salts are added to the soil as a fertilizer. One may visualize what occurs by letting CaZ represent a calcium zeolite, whereupon reaction with potassium chloride (2KCl) produces potassium zeolite (K_2Z) and calcium chloride (CaCl₂). The calcium chloride washes off in rain water, and the valuable potassium ion is held by the insoluble zeolite.

Artificial zeolites, known as permutites, are made by melting kaolin (aluminum silicate) with quartz and soda. Their chief use has been to soften hard water. The mode of action is to replace the calcium in hard water by sodium. To do this, hard water is passed through a tank of sodium zeolite (Na₂Z). The water leaving the tank is soft. At intervals a brine solution (sodium chloride) is passed through the tank to regenerate the sodium zeolite and rinse out the undesirable calcium. The reversibility of the process and the insolubility of the parent substance is what makes it valuable.

This type of base exchange had been known for nearly a century, and its application to water purification had been practised for decades. In spite of this, intensive research on the general problem was carried on only after 1935, following the discovery of B. A. Adams and E. L. Holmes that certain synthetic resins possessed ion-exchange properties.

The new zeolites are referred to as carbonaceous zeolites and resinous zeolites. A disadvantage of the natural zeolites was their instability toward acid solutions. Both of the newer types are stable in acid solutions.

Carbonaceous zeolites are obtained by treating coal or lignite with strong reagents such as fuming sulphuric acid, or chlorosulphonic acid. S. J. Broderick and Dale Bogard of the U.S. bureau of mines reported that good carbonaceous zeolites could be made from Alabama bituminous coal by treatment with sulphur trioxide at 150° C. It may be assumed that there is sulphonation of hydrocarbon positions in the coal skeleton (i.e., ECH changes to =CSO₃H). Since these carbonaceous zeolites are sulphonates, they may function either as hydrogen zeolite or sodium zeolite. Regeneration of the hydrogen zeolites may be accomplished by treating the sodium zeolite with acid. Hydrogen zeolites, then, may remove metallic cations from solution and add only hydrogen ions into the solution in exchange. R. H. Beaton and C. C. Furnas of Yale university, New Haven, Conn., applied this method to concentrate extremely dilute copper sulphate solutions. Under idealized conditions, in a zeolite system concentrating dilute copper sulphate (1 g. in 20,000 g. of water), one pound of sulphuric acid brought about an increase in concentration equivalent to the evaporation of more than two tons of water. This method gave promise of having broad applications to recovery problems.

Resinous zeolites are of two types: (1) a phenolformaldehyde resin into which sulphonic acid groups are incorporated; (2) condensation products of aniline or aromatic amines with aldehydes, into which strong basic groups are introduced, such as quaternary ammonium hydroxides. The first of these is a cation exchanger which functions much like the carbonaceous zeolites. The second is an anion exchanger. It is obvious that as a salt-containing solution is passed through both types of resinous zeolite in turn, all dissolved salts will be removed from the water. R. J. Myers and J. W. Eastes of Resinous Products and Chemical company reported on favourable tests in water purification by this type of approach. The development was finding new uses in cases where very dilute solutions were involved.

Nuclear Chemistry and New Elements

Much information about radioactivity had been collected since the discovery of radium by Pierre and Marie Curie in 1898. The cause of radioactivity was stated by Ernest Rutherford and Frederick Soddy in 1902 to be spontaneous atomic disintegration with the attendant emission of energy in the form of rays or particles. A decade passed before Rutherford made his fundamentally important conjecture of the existence of the nucleus of the atom. Rutherford again in 1919 demonstrated that the nucleus could be disrupted artificially by bombardment with high-speed helium nuclei or "alpha particles" from natural radioactive sources. The alpha particle may be regarded as a high-speed bullet designed to pierce the nucleus of the target atom so as to knock out one or more of its constituent particles. In 1933 J. D. Cockcroft and E. T. S. Walton learned how to impart sufficient speed artificially to a hydrogen nucleus so that the latter could bring about atomic disintegrations without help from radioactive sources. Their method was to accelerate the hydrogen nucleus to a bombarding speed in a high-voltage field obtained by the use of electrical transformers. Shortly thereafter, this method was modified and greatly improved by Ernest O. Lawrence's cyclotron. In this way more than 700 atomic transformations were studied and nearly half of these produced radioactive atomic species. From 1936 to 1946 more artificial radioactive species were produced and identified than were previously known of the natural variety.

To understand the underlying principles involved in these phenomena and related ones which involve release of atomic energy, it is necessary to understand the basic features of atomic structure. Formerly, the list of chemical elements began with hydrogen as the lightest and ended with uranium as the heaviest. An atom, the smallest unit of an element, is composed of a tiny but relatively massive nucleus and a large external sphere of influence containing relatively weightless electrons. The weight of the nucleus is traceable to the positive charges and neutrons which are contained therein, the number of positive charges being invariable and different for each atom. The neutron is a neutral particle consisting of a positive charge balanced by a negative charge. It contributes, therefore, to the mass of the nucleus (because of its positive charges within). An electron may be captured by a neighbouring atom in the production of molecules or ions. These external electrons are responsible for the chemical properties of an element.

Although the number of positive charges in the nucleus of an atom cannot vary, the number of neutrons may. Two nuclei of the same element containing different numbers of neutrons are called isotopes. It is obvious from this that isotopes of the same element have differing atomic weights, but identical chemical properties since the number of positive and negative charges is not disturbed. Iso-

topes cannot be separated, therefore, by chemical means. The two isotopes of hydrogen are called hydrogen and deuterium. The nucleus of hydrogen contains simply one positive charge, whereas deuterium or "heavy hydrogen" contains one neutron in addition to the positive charge. Helium, the second element, contains a nucleus with two positive charges and two neutrons, hence an "atomic weight" of 4. Carbon, the sixth element (at. wt. 12), contains 6 positive charges and 6 neutrons. This kind of thing continues till one reaches uranium (at. wt. 238) with a nucleus holding 92 positive charges and 146 neutrons. Chemists refer to it as element number 92 because of the 92 positive charges in the nucleus. The isotope of uranium of atomic weight 235 also is No. 92, but it contains only 143 neutrons within the nucleus. Natural uranium is a mixture containing 99.3% U238, and 0.7%

U235, and a trace of a third isotope U234. To achieve the power production called for in the atomic bomb, the two isotopes of uranium had to be separated in quantity and, except for the enormous governmental subsidy of about \$2,000,000,000, such a separation would have required several decades. (See also ATOMIC BOMB; PHYSICS.) Since uranium hexafluoride, UF₆, exists as a gas above 56° C. it was the reference compound selected for most of the separation procedures. These physical methods, among others, were adopted for the separation of U235F₆ from U238F₆: electromagnetic deflection (depending on molecular mass) of a beam of ionized UF₆ molecules, diffusion through porous barriers permitting the lighter gaseous molecules to penetrate a little faster than the heavier ones, and thermal diffusion of uranium hexafluoride in a vertical annular tube kept hot at the core and cool at the outside thereby attracting the heavier isotope to the cooler surface.

Radium, as it decomposes, ejects from its nucleus a fast-moving helium ion known as an "alpha particle." If this helium missile is directed so as to collide with a beryllium atom a neutron is expelled from the beryllium nucleus at high velocity. The velocity of this stream of neutrons may be moderated by passing it through heavy water, graphite, or other materials. It is this type of slowmoving neutron that causes the disintegration of uranium 235 into two smaller atoms such as barium and krypton. The energy released in this process is 5,000,000 times that obtained from burning an equal weight of coal. As a matter of fact, uranium 235 gives off neutrons spontaneously. In a pile of pure natural uranium (chiefly 238) of sufficient size these neutrons penetrate the 238 molecule to yield a short-lived isotope of uranium (at. No. 92, at. wt. 239). Heat is generated spontaneously, and one of the neutrons in this nucleus throws out its negative charge as a "beta particle," thereby increasing the number of positive charges in the nucleus from 92 to 93. The element thus formed is named neptunium. In turn, it loses another beta particle in the course of a few days, giving rise to plutonium, element 94. This element, discovered late in 1940 by G. T. Seaborg, E. M. McMillan, A. C. Wahl and J. W. Kennedy, was first obtained pure in weighable quantities in 1942 by B. B. Cunningham and L. B. Werner. Only a couple of years later it was produced industrially at Hanford, Wash. This site was selected to utilize the cooling action of the Columbia river. The construction of the massive plant at Hanford was a triumph of co-operation between chemical engineers, chemists and physicists, because its preliminary design was under way at a time when the world's supply of plutonium

was invisible to the naked eye. As is well known, plutonium resembles uranium 235 in that its nucleus can be made to disintegrate by slow-moving neutrons.

Two new elements named americum (No. 95) and curium (No. 96) were announced on Nov. 16, 1945, by G. T. Seaborg at a meeting of the American Chemical society held at Northwestern university, Evanston, Ill. These elements were found to be among the products produced by bombardment of uranium and plutonium with very high energy (40,000,000 electron volts) helium ions in the 60-in. cyclotron of the University of California, Berkeley, Calif.

Seaborg called attention to the fact that in the periodic arrangement of the chemical elements those above actinium (No. 89), namely, Ac, Th, Pa, U, Np, Pu, 95, 96, seem to represent the beginning of an "actinide" series not unlike the rare earth series from lanthanum (No. 57) to lutecium (No. 71). This provides an explanation for the general similarity in chemical behaviour of the new elements: e.g., the valences of uranium are 3, 4, 6 with 6 the most stable; neptunium, 4, 5, 6 with 4 the most stable; plutonium, 3, 4, 5, 6 with 3 the most stable; and the prediction of very stable trivalent states for elements 95 and 96.

A. V. Hevesy's work in biochemical experiments with radioactive phosphorus was but one of many important applications which came to the front after the advent of artificial radioactivity. If red phosphorus (atomic weight 31) is treated with accelerated deuterons (the nucleus of "heavy hydrogen") from a cyclotron, then a supply of radioactive phosphorus is produced, the latter having an atomic weight of 32 and a half-life period of two weeks. When changed to a phosphate and administered in various organs of an animal its transformations in the body can be followed closely. In this way, for example, it has been shown that almost immediately after the introduction of active phosphate into the blood stream a large part of P32 is to be found in the skeleton. The role of phospholipids in fat metabolism was another of the many problems attacked by this method. Chemotherapy

In the brief period 1937–46, there were more significant and useful developments in drug therapy than in any preceding decade. These discoveries were of outstanding importance and effected the saving of more lives than had been taken in warfare; and the end was not in sight. While there never will be a time when there is no illness, there were fewer deaths from known diseases as scientists applied the findings of the decade and wrung from their experiments new discoveries of equal and perhaps even greater importance.

Chemotherapy is only part of drug therapy. While it had been variously defined, the word by 1946 was popularly reserved for that branch of therapy involving the use of potent chemical preparations which are effective against certain infections and other diseases, involve com-

paratively little risk for the patient and are usually given by mouth or by injection. The term was coined by Paul Ehrlich, who confined its use to chemicals active against disease-producing living agents within the body, presumably because this was his field of interest. By 1946, the term had broader significance and represented an approach to the control of disease that occupied a unique and large part of therapy. The advances made in this field from 1937 to 1946 can be summarized best by considering first the more important drugs and then the effects of these drugs on disease processes and the change in seriousness of the disease that resulted from their use.

Outstanding Chemotherapeutic Measures.-Sulfonamides.-In 1937 the possibility of controlling widespread infections such as streptococcal infections by a simple chemical substance was impressed upon the scientific world when sulfanilamide was adopted for general use. From 1935, the year in which Gerhard Domagk, a German scientist, announced his discovery that prontosil would protect mice against the dreaded streptococcal infections, until 1937, feverish research by German, French, English and U.S. investigators was undertaken to prove the safety and usefulness of prontosil, neoprontosil and sulfanilamide, all early members of what became known later as the sulfonamides or "sulfa" drugs. The results of the investigations firmly established sulfanilamide as an effective agent for the control of a variety of infectious processes.

Included in the early workers were L. Colebrook and M. Kenny of England; J. Tréfonël, F. Nitti and D. Bovet of France; and Perrin Long and E. A. Bliss of the United States. The French group first demonstrated the sulfonamides to be effective because in the body they were broken down to release free sulfanilamide. This discovery resulted in a tremendous search for new compounds; drug and pharmaceutic houses, medical schools and other centres soon were busily engaged in the synthesis of hundreds of chemical preparations, most of them being derivatives of sulfanilamide.

In 1938, sulfapyridine was introduced and was later shown to be another sulfonamide of merit. Like sulfanilamide, it possessed the common radical $-SO_2NH_2$. It was L. E. H. Whitby of England who demonstrated that sulfapyridine was more effective than sulfanilamide in the control of experimental pneumococcic infections. Later, other infections also were shown to respond even more effectively. At the same time, researchers such as E. K. Marshall, Jr., of the U.S. developed the sodium salt of sulfapyridine so that a soluble preparation could be administered by injection to those who were too ill to take the drug by mouth.

In 1939, sulfathiazole was made available. In the following year sulfaguanidine, or sulfanilylguanidine, was advanced for the treatment of bacillary dysentery. This member of the group offered a different approach as it depended for its action on its local effect in the intestine and poor solubility in the body. The other sulfonamides depended on their absorption into the body tissues so that they could come in contact with the invading and multiplying bacteria. In the same year, 1940, sulfadiazine was offered to the waiting medical profession.

Thousands of compounds were created, hundreds were tested, but only a few survived. The majority were ineffective, toxic or impossible of large-scale manufacture. In 1946 the list of generally available compounds included sulfanilamide, sulfapyridine (seldom used because of toxic properties), sulfathiazole, sulfadiazine, sulfamerazine, sulfapyrazine, sulfaguanidine and succinylsulfathiazole.

The latter two compounds were used for their effects on bacteria in the intestinal tract. All the others, with the exception of sulfanilamide, were available also in the form of soluble sodium salts.

The exact mode of action of the sulfonamide compounds was still uncertain, but experimental evidence indicated that they might interfere with certain enzyme systems necessary for the multiplication or survival of bacteria. The choice of the sulfonamide to be used in the control of an infection depended on bacteriologic diagnosis, experience gained concerning the effect of these drugs and the variety and severity of the toxic reactions that might be produced. To permit proper therapy it was necessary to know the values of the sulfonamides in the blood and body fluids, and these were determined at frequent intervals during the course of treatment. Otherwise, a drug concentration either too high or too low might be obtained.

These were the highlights of the part played by the sulfonamides in the history of chemotherapy. Regardless of the phase of the subject, there was no doubt that an army of research workers had considered it, torn it apart and, if necessary, offered a substitute in the interests of progressive drug therapy.

Antibiotics.—Another class of chemotherapeutic agents that excited the popular imagination in the period 1937–46 was the antibiotics. This term meant little until the name penicillin appeared on the horizon. In an unbelievably short time it became a household byword, and almost legendary properties were attached to it.

Like the sulfonamides, penicillin was known for a long time before its usefulness was utilized. As early as 1929 the English bacteriologist, Alexander Fleming, discovered the secretion from a mould which contains penicillin, and soon afterwards suggested its use. But it was not until 1938–40 that this suggestion was followed and Fleming's work was repeated by others and seriously studied. In 1941 was begun one of the most gigantic co-operative projects in scientific effort that the world had ever seen. In that year, H. W. Florey and N. G. Heatley, two other English researchers, visited the U.S., convinced of the value

Electronic equipment for drying penicillin. Developed to replace the freeze-drying method, this process reduced costs and speeded production of the valuable drug

-preparations for the prevention and cure of certain conditions, and as knowledge of their value increased their usefulness would be more clearly defined. An example of the progress made in this field was the discovery in 1945 and 1946 that folic acid could produce the same clinical response as liver extracts in patients suffering with pernicious anaemia. By careful experimental work it was also shown that vitamin mixtures must contain ingredients in certain proportions to be most effective. Probably one of the most important conclusions made in this period concerned the value of eating daily a good diet instead of depending on vitamin mixtures to maintain health and prevent vitamin deficiencies.

Hormones.—The medical profession had used endocrine, or hormone, preparations for many years, but it was only during later years that these products were placed on a sound basis of standardization. The effects of many preparations formerly obtainable only from animal glands were served by the development of synthetic chemicals manufactured in laboratories of drug and pharmaceutic houses. Furthermore, in the same period, the probable uses of endocrine preparations were more clearly defined, and some of the nonmedical claims were thrown aside to lessen the confusion in the field of endocrinology resulting from the use of irrational mixtures or dosages of no value.

By 1946 the useful endocrine preparations could be divided into naturally occurring and synthetic compounds and according to their use; i.e., the gland of which they were simulating the effect. Included were thyroid gland and thyroxin, available for thyroid gland deficiencies; parathormone for parathyroid gland inadequacies; adrenal cortex extract for the adrenal gland cortex deficiency; several types of insulin for the pancreas; estrogenic substances such as estrone, estriol, estradiol benzoate and diethylstilbesterol for the female sex glands known as the ovaries; progesterone and corpus luteum extract for the ovaries; androgens such as testosterone for the male sex glands; and various fractions for growth, etc., from the anterior part of the pituitary.

Other hormone preparations had become available which were not always limited in use as substitutes for missing hormones when the glands of the body became deficient in action. For example, extracts of the posterior part of the pituitary gland may be used for the control of haemorrhage following childbirth, and extracts of part of the adrenal glands may be used for the control of asthma. Of much importance was the research on the best methods of administration. Thus, the various products can be administered according to the needs of the patient, by mouth, injection, rubbing on the skin, insertion into the body cavities and even by placement in the body muscles.

Other Drugs.—Antiseptic agents for local use were of special importance during World War II, and investigators with commercial and humanitarian interests engaged in research in quest of new and more effective compounds. Many of the results obtained in this field stemmed from work begun before World War II and from researchers not working directly for agencies engaged in the prosecution of war efforts. As a result, the medical profession received quaternary ammonium compounds such as phemerol, zephiran and ceepryn, nitrofurans such as furacin and undecylinic acid compounds. Unfortunately, no compound was discovered that could be used with complete assurance that it would kill all contaminating bacteria and fungicides on contact. The development of such a product would have been of immeasurable value in the control of

athlete's foot, more correctly termed epidermophytosis, and of other conditions that plagued the soldier and industrial worker.

Two substances that excited the curiosity of the clinicians in 1945 and 1946 were benadryl and pyribenzamine preparations intended for the relief of hay fever and other allergic manifestations such as urticaria. In addition to being often dramatically effective, these compounds focused attention on an approach to allergy that had not previously been thoroughly investigated. Neither drug was a cure; both were of value only for the relief of symptoms.

Digitalis had been a standard drug for the treatment of certain heart diseases for many years. Since it was not a chemically pure substance, chemists tried to determine its ingredients, pharmacologists the effects of these ingredients and clinicians the value. Thus, purified digitalis principles such as digitoxin came into use and by 1946 had gained considerable popularity. Their purity and potency offered several advantages over the older impure digitalis preparations.

In the field of drugs relating to the induction of sleep and the relief of pain, attention was directed to new barbiturates with fewer undesirable side effects and to morphine substitutes such as meperidine or demerol. When records of German investigations were examined at the end of World War II, a substance known as amedone was brought to light and subjected to considerable trial because of its possibilities as a morphine substitute. Somewhat related were the products intended as anti-convulsants, and two useful substances for the control of epilepsy were discovered—dilantin and tridione. Intocostrin, a derivative of curare, was found to produce muscle relaxation which permitted the use of less anaesthetic during operations.

Other drugs probably belonging in the field of chemotherapy included amino acids for parenteral use and radioactive substances for the experimental investigation of blood disorders and other diseases. Perhaps such agents would be called biologic preparations by some individuals because of their origin, but their usefulness placed them in a part of therapy that included true chemotherapeutic agents. In the same way, fibrin foam, albumen, globulin and plasma, which are blood derivatives, must be considered when chemotherapy is under discussion. These derivatives were of much value during World War II and were made available in dried form, which permitted much saving in space in shipping and provided longer keeping qualities.

World War II and Chemotherapy.—The developments in research that occurred from 1937 to 1939 when the world was plunged into total war, and from then until 1946 provided unique contributions to the maintenance of the health of the fighting forces and the civilian populations. Disease was controlled on the battlefront and on the home front in an unprecedented manner. While improved hospital facilities and better training for medical personnel were of much help in therapy, the use of drugs was of great importance. Medical research helped bring the war to a conclusion more quickly, and at the same time war precipitated more research than was conducted during peacetime. If any good can be said to come of war, it would stem largely from the advances made in medicine.

Examples of the tremendous advances in treating the fighting man could be found in the records of the Allied armies. In the U.S. army of World War I, the over-all death rate from infection was 16.5 per 1,000 men per annum; in World War II, 0.6 per 1,000 men. The death rate from pneumonia during World War I was $26.0\frac{9}{70}$.

during World War II 0.6%; for meningitis it was 34% and 4% for the two wars, respectively. In World War I the complications from venereal disease rose as high as 40%; in World War II only 4%. In World War II, no man in the U.S. army died from typhus, as the army was not infested with lice; and of those who received inoculations to prevent tetanus infections, only one man died of tetanus.

Of the advances that occurred because of war research much could be said, although the full possibilities of some of the projects would not be known for years. The complete mass of research done by all countries during the war years was not known and was probably of such astronomical proportions as to be beyond comprehension for the average imagination. Since some figures were available for the medical research in the U.S., a few may be cited for emphasis. In addition to the millions of dollars spent by industry, philanthropic institutions and colleges and universities, the U.S. government provided funds for agencies such as the Food and Drug administration, National Institute of Health, the Office of Scientific Research and Development and the Committee on Medical Research, which had a close alliance with the Division of Medical Sciences of the National Research council. The work of the Committee on Medical Research was done largely through contracts with universities, medical schools, hospitals and research institutes and a few with other government agencies and commercial firms. The expense was about \$24,000,000 and paid in part for the services of 5,000 investigators who worked on a long list of subjects such as protection against influenza, pneumonia and gas gangrene; prevention and treatment of venereal disease; antimalarial compounds; treatment of wounds and shock; protection against poison gases and insecticides.

Some of the work done under the impetus of war was concerned with problems not primarily intended for therapeutic application, but nevertheless provocative of therapeutic speculation. For example, early in the course of the war, British investigators were studying protective agents against the actions of war gases such as arsenical vesicants. They found that 2-3-dimercaptopropanol, later known popularly as BAL (British anti-lewisite), has an effect on body tissues suffering from arsenical poisoning. Soon British and U.S. investigators were working together on synthesis and production problems and on pharmacology, toxicology and clinical efficacy. BAL became recognized as a treatment measure for arsenical and bismuth poisonings.

Another chemical discovered to have druglike properties was Di-isopropyl fluorophosphate (DFP), active as an anticholinesterase. It was tried at once in the treatment of myasthenia gravis, glaucoma and other conditions.

The nitrogen mustards were developed during a search for more effective vesicant war gases and were shown to have a marked effect on lymphoid tissue. Thus they were tried in the treatment of neoplasms of this tissue such as Hodgkin's disease and leucaemia, with promising results. Here was another example of therapeutic advances stemming from war-born research.

Effects on Disease.—Probably the value of chemotherapy can be appreciated best by studying the effect of drugs on suppression or control of various diseases. Even a brief study of the mortality rates of pneumonia, meningitis, streptococcal and staphylococcal infections and gas gangrene provided a dramatic and almost astounding revelation of the possibilities of modern drug therapy. At one time these were dreaded infections. In 1946, they were looked upon comparatively lightly. Even tuberculosis and

leprosy seemed to be coming under the control of chemotherapy. Epilepsy, allergy, tropical diseases, hypertension, migraine—to mention only a few—were some of the problems subject to constant attack by drugs. There was no specialty in medicine that had not benefited by the developments in chemotherapy from 1937 to 1946. These drugs did not remove the need for surgery or other recognized medical approaches to illness, but they did much to lessen the amount of illness, the severity of the illness, the complications and the number of days of illness. They helped materially to advance life expectancy in the U.S.; e.g., to over 65 years in 1946 as compared with less than 50 years in 1900.

Contributing Factors.—The value of chemotherapy and the progress with which it was credited depended on several important factors. Contributions were made by representatives of practically all recognized sciences. It was aided by a new appreciation of co-ordinated research. It was made more practical by a better approach to the laboratory and clinical appraisal of new drugs as criteria were proposed, studied, improved and adopted.

At the same time, general educational advancements provided much help. And supporting efforts, such as improved hygienic measures, the development of insecticides such as DDT, the preparation of effective rodenticides such as alphanaphthyl thiourea (ANTU) and sodium fluoroacetate (1080) contributed to the advance. Included in the educational advancements were the investigation, exposing and publicizing of questionable remedies by such bodies as the Council on Pharmacy and Chemistry of the American Medical association and the Journal of the American Medical Association. The renown and prestige of these agencies facilitated widespread dissemination of their statements. (See also Dentistry; Endocrinology; Medicine; Pneumonia; Surgery; Urology; Vitamins.)

Chemurgy

Chemurgy in 1937 was a word unfamiliar except to the few who had begun to explore its possibilities. By 1946 it had grown into a concept of world-wide human significance.

Chemurgy is not a separate science. It is a concept which teaches that by extending the understanding and utilization of agricultural materials the base of mankind's

wealth can be greatly broadened.

Agriculture formerly was a primitive enterprise whose products were utilized only for food, clothing and shelter. Only a few simple mechanical processes were known. Grains were cleaned and sometimes ground for food. Such natural fibres as wool, cotton and flax were woven into fabrics. Wood was sawed into lumber.

All these processes were still carried on during the decade 1937–46; they were extended and supplemented, however, by many new processes, some of which employ technologies of the highest scientific order. Agriculture's raw materials were refined and processed into many hitherto unknown ultimate uses.

Organic chemistry, plant genetics and physics may be said to have been the three basic chemurgic sciences. The arts of the agricultural, industrial and chemical engineer were basic to chemurgy, too, because they accomplished steps in production, transportation and processing which could not have been attempted without their aid.

In the pre-chemurgic era fully one-half of the agricultural raw materials produced were returned to the soil. They had no commercial markets. Only the grain of the corn or wheat could be sold. The stalks, leaves, husks and other parts of the corn plant, as well as the straw and chaff of the wheat had no markets and few uses off the farm. In some instances, such as corncobs and the straw of seed flax, the residues were a nuisance requiring expense or effort for their disposal.

So far as any human being knows, nature is creating no new iron, copper, petroleum or supplies of other minerals. Over the centuries it is inevitable that their annual consumption, accelerated as it seems to be by occasional wars, must eventually deplete these irreplaceable stores to a point where, either because of approaching exhaustion or higher costs of extraction, they will no longer be either plentiful or cheap.

In contrast, the entire annual production of plant materials may be consumed, except for seed, in any one year and entirely replaced or even increased in the next annual cycle. The principal fundamental materials for plant life are atmosphere and moisture which are converted by the mysterious powers of sunshine into solid substances. Only from 2 to 5% of the content of any plant, be it a squash or an oak tree, is actually extracted from the soil. The extracted materials are primarily nitrogen, which can be replaced from the air, potash and phosphorus, of which world supplies are fairly abundant.

The chemurgic concept of fuller utilization of plant substances therefore is based upon ever-renewable and inexhaustible sources; while mineral resources are exhaustible and irrenewable. The conservation of mineral resources is an aspect of chemurgy that became more conspicuous after the great depletions for World War II had been appraised.

Agriculture in the old sense considered itself engaged principally in the production of wheat, corn, cotton, fruits, vegetables and other specific crops. As the chemurgic idea expanded it became apparent that agriculture would increasingly regard itself as a producer of cellulose, proteins, oils, starch, sugar and other natural chemical compounds for industrial conversion.

The potential wealth in plant raw materials seemed barely to have begun to be explored by the end of the decade. It was estimated that botanists had identified 335,000 species of plants on the face of the earth by that date, but economic values had been discovered for few more

than 2,000 species. Not many more than 1,000 species were being cultivated on any extensive scale.

Relatively few of the 335,000 known species had been thoroughly examined for their chemico-economic values. One could hardly doubt that such examination would reveal that many species not cultivated would yield products of economic importance. In many instances the products eventually discovered might serve economic uses unknown to or possibly unthought of by mankind. Plant geneticists, who had nearly doubled the sugar content of the sugar beet, who had been able to breed varieties of soybeans to increase the oil content in one instance or the protein content in another, could be expected to increase the usefulness of many other species once the desirable economic characteristics were discovered. Chemurgists urged that all governments should undertake thorough studies to reveal the full chemical and economic values of national flora.

During the ten years 1937–46 new non-food uses were found for many of the standard agricultural crops. New crops were introduced into the agricultural economy. Profitable uses were discovered for some portions of the huge tonnage of agricultural residues. It was possible to state truthfully that during World War II no warship, aeroplane or cannon went out fighting from the "arsenal of democracy" without products of agriculture entering at some point into its manufacture.

A number of specific examples may serve to give a reasonably fair picture of the progress on many fronts.

Soybeans.—Soybeans (q.v.) became the most widely known chemurgic crop, since the versatility of its utilization constantly amazed those who kept up with soybean progress. A study at the end of the decade listed 200 purposes for which soybeans were used. The annual production of soybeans in the United States increased from 34,-000,000 bu. in 1936 to 200,000,000 bu. less than ten years later. The larger part of the soybean output found its way into human food and animal feed. The oil became an important ingredient of margarine, salad dressings and other food preparations. The meal became a basic protein in livestock and poultry feeds. Nevertheless, from 15 to 20% of the soybean was converted into inedible products. Chemists learned how to refine the oil by processes which separated the fractions so that parts of the oil most desirable for food could be sent to the food manufacturers while the other fractions were made more desirable for the paint or soap makers.

A dramatic war use developed from the refinement of soybean proteins. Fires, even such intense fires as gasoline fires on bombed aircraft carriers, were almost instantly extinguished by "fire-foam." This product was made from an alpha-protein of soybeans. Mixed with water as it flowed through a nozzle, it laid down a heavy foam blanket which even in a wind of hurricane force deprived fire of its necessary oxygen and quickly extinguished flames.

Extensive experimentation was conducted into the manufacture of fibre from soybean protein. Pilot plant development was achieved by the end of the decade.

Casein.—Fibre manufacture from casein, a by-product of milk, became well established. Under the trade name of Aralac, the product of a factory in Connecticut became well known. Used in blends with other fibres, the casein fibre lends softness and luster to garments. During 1946 the first factory to make paint brush bristles from casein was opened in Maryland.

Ramie.—Under the heading of new crops, ramie production in the United States began to get under way in 1946. It was estimated that from 3,000 to 5,000 ac. were growing

in Florida with smaller tracts established in Georgia, Louisiana and Texas. The erection of two processing plants, each costing about \$200,000, indicated that large industries operating in Florida were convinced that the difficult mechanical problems in the decortication and degumming of ramie had finally been minimized if not fully solved.

Sweet Pótatoes.—Florida also was the location of an \$8,000,000 plant opened early in 1946 at Clewiston by the U.S. Sugar corporation, for the manufacture of sweet potato starch. This factory was built to process sweet potatoes grown in the Florida Everglades, where varieties notable for their high yield and high starch content had been established. The annual yield of the factory was expected to be 50,000,000 lb. of starch, valued at about \$2,500,000.

Sweet potato starch resembles the tropical starches obtained from cassava and arrowroot. Cornstarch, the leading U.S. starch, is not suitable for some of the purposes for which these tropical starches had been imported in large quantities to the United States.

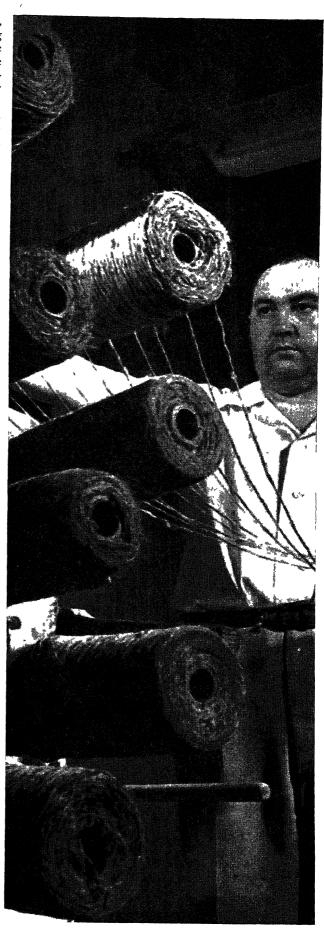

Corn.—Cornstarch, however, continued to provide one of the main non-food outlets for this most abundant American cereal. New industrial requirements steadily increased the starch demand in so many fields that no overproduction was expected for years to come. Scientists in several universities were working on assignments to increase the fundamental knowledge of starch, particularly the structure of the starch molecule. It was said that if anyone could discover the molecular structure of starch, it might even become a more important industrial material even than petroleum.

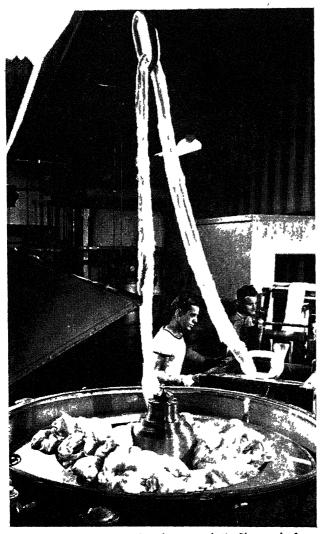

Corn (q.v.), of course, was also an important material in the manufacture of alcohol and synthetic rubber. The head of the Rubber Reserve corporation declared that the Normandy invasion could not have been conducted at so early a date had it not been for the rubber made from the alcohol which came from the corn crop.

Corncobs, hitherto an unmarketable by-product of corn, came into considerable demand to meet war needs. Large quantities of furfural were needed to refine lubricating oils and as a solvent. Produced for many years from oathulls, furfural became necessary in such large quantities that not enough oathulls were available from the breakfast food manufacturers. A new plant was constructed in which corncobs were processed to produce this important chemical. Furfural was a necessary ingredient also in the manufacture of abrasives, since it intensifies the adhesive qualities of the resins which bind the hard particles together.

Also, ground corncobs found an established market for "soft grit blasting." Used in a machine similar to a sand-blast machine, they are effective for removing grease and foreign materials from finely machined metal parts such as are found in aeroplane engines. They were also used extensively in ordnance factories for the final polishing of large guns.

Penicillin.—Corn chemurgy had an important part in the abundant production of penicillin. When this mould-produced drug was first introduced into the United States, no process for rapid multiplication of the mould had been found. Scientists at the Northern Regional Research laboratory, Peoria, Ill., discovered that production of the mould could be sharply increased if it were given a diet of steep liquor, drawn off after corn was soaked before

Process in the production of aralac, a synthetic fibre made from casein. This picture shows the machine used to recover chemicals with which the ground casein is treated

distillation, and lactose, the sugar manufactured as a byproduct of milk. The Peoria chemurgists were able to multiply the yield of penicillin first by 100-fold and eventually by 250-fold. Penicillin might thus be characterized as completely a chemurgic product.

At this point, it may be mentioned that the Northern Regional Research laboratory which did this notable work on penicillin was one of four which were created by act of congress in 1938. At that time the public demand for chemurgic research had begun to develop. Appropriations were made to build four laboratories, one in each of lour agricultural regions. The sites chosen were at Peoria, New Orleans, near Philadelphia and near San Francisco. Buildings and equipment cost about \$2,000,000 for each, and funds amounting to about \$1,000,000 each per year were made available during the decade.

Large expenditures for chemurgic research were made in industrial laboratories. The construction of the federal laboratories, directed by the United States department of agriculture, gave a tremendous impetus to research, both public and private, in the utilization of farm raw materials. Several universities established research in chemurgy. Indiana, Nebraska and other state legislatures set up special chemurgic appropriations.

Rutin.-In the field of health, the Eastern Regional

laboratory perfected the extraction of a drug called rutin. Manufactured by five or six pharmaceutical companies in 1946, rutin relieves the hypertension of blood vessels which is sometimes fatal. First extracted from flue-cured tobacco which was found to be too expensive a raw material, rutin was later made from green buckwheat leaves. Department of agriculture announcements indicated that about 50,000 ac. of buckwheat would be grown annually to supply about 10,000 lb. of rutin.

Cotton.—Being the major crop in the southern states, with surplus quantities produced regularly, cotton (q|v) was the object of much chemurgic research. One of the most hopeful approaches was the development of new varieties possessing especially desirable qualities. D. Howard Doane, on plantations in Mississippi, and George F. Wild in South Carolina pioneered in efforts to establish varieties with the characteristics most desirable for automobile tires which, next to textiles, account for the largest use of cotton during the decade.

Doane began breeding cotton for tires in 1936, and by 1941 not only had a fibre that was declared equal to that produced in Egypt but had begun marketing the output of several thousand acres. His accomplishment marked the first instance of producing cotton to meet industrial specifications. He had, at the beginning of the experiment, consulted tire manufacturers as to the nature of their requirements, and had obtained a list of the eight characteristics which they most desired. A notable discovery, made in the course of this work, was that the length of the fibre is not necessarily the controlling factor in determining its strength.

The Southern Regional Research laboratory made extensive studies of chemical treatments of cotton to improve its adaptability to varied uses. Mould-proofing treatments proved to add to the life of cotton when the fabric was exposed to moisture, as in sandbags. Flame-proofing treatments were discovered which survived frequent launderings and did not conspicuously alter the qualities of the fabrics. A new elastic cotton bandage found wide use in treatment of sprains and cuts and in surgical applications.

Fruits.—The volume of wastes in fruit production and processing became so large as to invite attention to the possibilities of finding more uses for the culls, off-size fruits, skins, seeds and other residues. One well-established result was the perfection of an apple honey or syrup from cull apples. This displaced glycerin as a moistening agent for tobacco in the factories of one of the leading cigarette manufacturers.

Cigarette Paper.—Practically no cigarette paper was manufactured in the United States prior to 1939. In September of that year Harry S. Straus, who formerly had been in the same business in France, opened a \$5,000,000 plant in western North Carolina which later more than doubled in capacity. By 1946 nearly all the paper for U.S. cigarettes was being produced domestically.

The French industry found its raw material in the discarded linen rags collected in central Europe. The first obstacle which confronted Straus in the United States was the difficulty of finding raw materials, since linen was not extensively used. After much expensive experimentation, he found that a superior grade of paper could be made from the straw of seed flax, collected after the flax crops had been threshed for the linseed so widely used in paint oils. This straw had always before been an unused waste. Straw from two widely separated areas, Minnesota and southern California, was blended to make the pulp. This formerly wasted material now not only supplied the

paper for most of America's cigarettes, but was also manulactured into paper for a portion of the United States currency.

Guar.—The search for new crops for specific purposes frequently originated with a specific need in industry. Paper manufacturers, for instance, had long desired a better material than water for hydrating the pulp as it spreads on the paper machines. The Institute of Paper Chemistry initiated a search for such a material. A satisfactory substance was eventually located in a legume called guar, native to India. From the guar seed a semimucilaginous substance was extracted which served the desired purpose in the manufacturing process and which imparted to the paper certain improved qualities.

Seed was obtained, and 25 paper companies were invited to participate in completing the experiment. A large milling company, General Mills, was brought in to process the seeds. Irrigated land in Arizona was selected, and contracts were made with farmers for producing the seed, which fortunately yields heavily. After some misfortunes substantial quantities were obtained, and the material was used in increasing quantities. A new crop, of important and profitable character for a limited area, had been established to serve a purpose for which no suitable material previously existed.

Chicken Feathers.—Chemurgic studies thus began to cover a wide range. Wherever a material was available in quantity, especially if already assembled, and if little demand for it existed, research was likely to undertake finding a profitable use.

Poultry dressing plants, for example, accumulated chicken feathers in large quantities. Usually there was a disposal problem, except for the relatively small amounts salable for cheap cushion stuffing. The feathers were removed wet, and the wet feathers deteriorated so rapidly that shipment was difficult.

A simple chemical treatment was discovered to prevent decay in shipment. This opened the way to further studies. The principal element in the composition of feathers is a protein called keratin. The Western Regional Research laboratory discovered means to reduce the keratin to a thick syrup which, after being extruded through spinnerettes and hardened in a chemical bath, emerged as a new type of protein fibre. The United States Rubber company carried on further experiments with the fibre, having manufactured some of it into cloth and into garments. The wet strength, however, was still unsatisfactory in 1946, and commercial exploitation awaited further improvements in the process.

Significance of Chemurgy.—An appraisal of the future of the chemurgic concept could not hope to be precise. Nevertheless, chemurgy by the end of the decade 1937-46 was a new idea of considerable magnitude. Conceived at first primarily as a step toward the relief of agriculture from surplus problems, it shortly became evident that by expanding industries and creating new economic activities chemurgy could contribute to the enlargement of employment. Then as the plant resources of the world began to be estimated, and their ever-renewable character contrasted with the irreplaceable nature of mineral resources, the belief began to rise that chemurgy might hope in the course of decades to become the basis for a sort of universal abundance. A solid foundation of achievement along many fronts was laid during the 1937-46 decade. Solid though it was, only the margins had been touched. (See also Botany; Chemistry; Paper and Pulp Industry; PLASTICS INDUSTRY; RAYON AND OTHER SYNTHETIC FIBRES; TEXTILE INDUSTRY.)

Chennault, Claire Lee

), U.S. army air officer, was born Chennault (1890– Sept. 6, 1890, in Commerce, Tex. A school teacher during World War I, he was called up for service in 1917 and served in the aviation section of the signal reserve corps in the United States. After the war, he became an officer in the army air corps and commanded a pursuit squadron in Hawaii, 1923-26. He retired from the army in 1937 and in the same year accepted General Chiang Kai-shek's offer to become aviation adviser to China. In 1941, he founded the American Volunteer group of the Chinese army-a flying squadron of U.S. volunteer aviators, later known as the "Flying Tigers." Though hindered by inferior planes, the "Flying Tigers" repeatedly repulsed Japanese air attacks on the Burma road. Called back to active duty with the U.S. army air force on Apr. 16, 1942, he was promoted to brigadier general and two months later was named commander in chief of the U.S. air task force in China. Subsequently, his "Flying Tigers" were disbanded, and its members were inducted into the regular army air corps. Chennault announced (July 14, 1945), his resignation as commander of the U.S. 14th air force. Known as one of Chiang Kai-shek's most intimate advisers, Chennault defended the generalissimo against criticism by "irresponsible persons" in the U.S. and asserted that he had the "deepest admiration" for him. Chennault retired Oct. 31, 1945. He returned to China in 1946 and signed a contract in Shanghai with Chinese relief authorities to operate a relief airliner in China with U.N.R.R.A. funds.

Chernyakhovsky, Ivan Danilovich

Chernyakhovsky (1907?-1945), Russian army officer, was born in Uman in the Ukraine, the son of a railway worker. Orphaned while a child, he worked as a cowherd and later as a longshoreman in Novorossisk. By good fortune, he was able to attend a military school and there was grounded in the fundamentals of strategy that stood him in such good stead during World War II. Chernyakhovsky was a colonel when the Germans invaded Russia in June 1941. He covered himself with distinction during the fighting on the western Dvina in the summer of 1941, and a year later he was promoted to the rank of major general. In Feb. 1943 he led the soviet forces that broke through the German hedgehog defenses at Kursk. For this achievement, he was made a colonel general. By the spring of 1944, he had been promoted to the rank of army general and had been given command of the ard White Russian army. His forces, in conjunction with Gen. Ivan Bagramyan's army, cleared the Germans from White Russia. By autumn Chernyakhovsky had reached the approaches to East Prussia, and in Oct. 1944 his were the first Russian troops to cross into German territory on the eastern front. During the great offensive that started in Jan. 1945, Chernyakhovsky's armies conquered nearly all of East Prussia and he was about to complete this task when he died, Feb. 18, 1945, from a wound received in battle.

618 Chess

The most international of all games, chess was sorely tried by the ravages of World War II. World-wide competition virtually came to a standstill in 1939, and had just begun to pick up in 1946.

Dr. Alexander Alekhine, the Franco-Russian master, ruled as world chess champion during the war years but did not live to defend his title. He died March 24, 1946, at Lisbon, Portugal, at the age of 53. No successor to his throne had been decided up to early 1947. Dr. Alekhine first came into championship prominence in 1927, when he won the world title over José R. Capablanca of Cuba. Capablanca had held the championship from 1921. Alekhine held his championship until 1935, when he was defeated by Dr. Max Euwe, the Netherlands master. Alekhine challenged Euwe in 1937, the contest being held throughout the Netherlands on a 30-game basis; Alekhine won 11 games, Euwe 6, and 13 were drawn.

The year 1937 also marked the continued reign of the United States as international team champion. For the fourth time in succession, the Hamilton-Russell cup went to the U.S. team, consisting of Reuben Fine, Israel Horowitz, Isaac I. Kashdan, F. J. Marshall and Samuel Reshevsky. Hungary finished second in the 19-team field, with Poland and Argentina tied for third.

As for other international tournaments in 1937, Alekhine won at Hastings, England, with 8 points out of a possible 9, and P. Keres of Estonia won the meeting held at Semmering and Baden, near Vienna, with 9 out of a possible 14 points.

Two international tournaments marked play in 1938. At Todz, V. Pirc of Yugoslavia placed first with 11½ points. At Noodwijk, honours went to E. Eliskases, of Germany and Austria, with 7½ points out of a possible 9. Alekhine and Sir George Thomas shared top honours in the Plymouth congress with six points each. Keres and Fine featured play in a double-round tournament, held among the eight leading masters of the game.

The United States did not compete for the international team title in 1939, leaving the way for Germany to take first place, Poland second and Estonia third. Mikhail Botwinnik regained his Russian title in 1939, while Euwe won the British Chess federation tournament. The 40th annual North American championship went to Fine, with Reshevsky second and Horowitz third. The year 1939 also marked the merging of the National Chess federation and the American Chess federation into the United States of America Chess federation.

Only Russia and the United States staged important chess tournaments during 1940. The U.S.S.R. championship, feature of the year's play, went to Keres, who among others defeated Euwe. Reshevsky won the U.S. championship.

International chess was confined principally to the soviet championship in 1941, with Botwinnik regaining his U.S.S.R. title. Gideon Stahlberg of Sweden made two important conquests in 1941. In one, he captured the accepted international tournament at Mar del Plata, Argentina. In the other, he broke the world's record for the number of boards played simultaneously and the time played. He completed 400 separate games during 36 hr. and 5 min., winning 364, losing 22 and drawing 14.

Reshevsky won the national championship in 1941, held for the first time under the auspices of the United States Chess federation.

Competitive chess was confined chiefly to the United States during 1942, 1943, 1944 and 1945. Reshevsky dominated the first part of this period, winning the U.S. title in 1942 and holding it when no national title was contested in 1943. The 1942 tournament required a play-off between Reshevsky and Kashdan, each of whom ended regular play with 12½ points. In the playoff, the 31-year-old Reshevsky won in the 11th game, 7½ to 3½.

Alekhine continued his rule as world champion, although he did not risk his title. He competed in only one major tournament in 1942, a master's test at Salzburg, Austria, which he won.

With most of their masters at home during 1942, the U.S. Chess federation sponsored five tournaments—the U.S., the national open, the national rapid transit, the national amateur and the national women's. Reshevsky extended his reign in the U.S. championship to six years by defeating Kashdan in an 11-game play-off. Herman Steiner and Abe Yanofsky of 'Winnipeg, the Canadian champion, were tied in the national open, while Fine won the rapid transit. Edward S. Jackson, Jr., of Philadelphia was crowned amateur champion, and N. May Karff of Boston regained the women's title.

With neither the world nor national championships contested, 1943 proved an "off" year in chess. Horowitz won the U.S. open and New York state titles; Dr. Ariel Mengarini of Washington, D.C., won the amateur, and Fine continued as national rapid transit champion.

Reshevsky did not defend his U.S. title in 1944, but won the national open. Arnold S. Denker of Forest Hills, N.Y., closed a seven-year reign of Reshevsky as U.S. champion. Fine retained his speed championship for the third time, and Jackson retained his amateur title. Mrs. Gisela Kahn Gresser of New York won the women's championship.

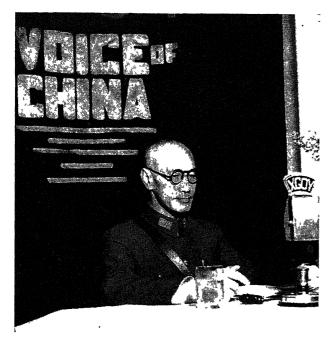

Denker successfully defended his U.S. title in 1945, while Anthony E. Santasiere of New York won the national open. Fine repeated as rapid transit champion; Paul R. Ellis of New York won the U.S. amateur; Mrs. Gresser defended her women's title, and Reshevsky won the Pan-American tournament. Russia defeated the United States, 15½ to 4½, in a radio team match.

European competition started anew in 1946 with no less than five major tournaments. Dr. S. Tartakower of Poland won the first postwar tournament at Hastings, England, while Euwe and Steiner were first in a two-division event at London. Mendel Majdorf of Poland won an international tourney at Prague, while Botwinnik, the Russian champion, won a masters' test at Groeningen, Netherlands. In the United States, Reshevsky was returned as national champion; Steiner won the national open, and Larry Friedman of Cleveland the national junior. Russia defeated Great Britain. 18 to 6, and the United States, 121/2 to 71/2, in team competition. (M. P. W.)

Chiang Kai-shek

Chiang (Chiang Chung-cheng) (1887—), Chinese statesman and generalissimo, came from a humble family in Feng-hwa, Chekiang province, and rose from poverty and hardship by his own efforts. He studied military science in the Chinese and Japanese military colleges from 1906—10. In 1910 Chiang became a loyal follower of Sun Yat-sen and in 1923 was sent to Russia to study soviet military methods and political institutions.

President of Whampoa Military academy in 1924 and virtual master of Kwangtung province in 1925, Chiang appeared upon the world scene as generalissimo of the Nationalist northern expedition in 1926. Breaking relu-

Broadcasting over the "Voice of China" on Aug. 15, 1945, Generalissimo Chiang Kai-shek announced the surrender of Japan and an end to eight years of war with that country

tions with the communists, he established the National government at Nanking in 1927. In Dec. of that year he married Mayling Soong and subsequently was converted to Methodism. After 1927 Chiang remained continuously in power: by political manoeuvring he outlasted his opponents and in the name of the central government he crushed the rebellions of 1929–36. His ten-year campaign against the communists was brought to an end by his kidnapping in the Sian incident of Dec. 1936.

After the outbreak of the war with Japan, Chiang's determination to resist Japan to the bitter end deepened the people's confidence in him, and his leadership was unchallenged for the duration. Early in 1941 Chiang declared that China had long ago cast its lot irretrievably with the democracies. Instead of resistance and reconstruction he began to enunciate victory and security as China's war aims.

A high point in the generalissimo's career came at the Cairo conference of Dec. 1943, where the principle of Chinese territorial unity including Manchuria was recognized as one of the main Allied war aims. With the coming of victory, however, complications arose. The revelation of the secret agreements made at Yalta showed that Russia not only had been promised the old tsarist rights to Manchuria but also was conceded the final separation of Outer Mongolia from China. These Allied decisions, which seemed to contradict the Cairo declaration, had to be accepted by Chiang in the Sino-soviet treaty negotiated in 1945, and subsequent developments in Manchuria—where Russia removed machinery, delayed the promised removal of its troops and armed the Chinese communists—seemed to confirm China's fears.

All this had its unavoidable repercussions on the generalissimo's attempts to carry out his political program for the unification of China. Before World War II was over he announced his intention to end the "period of tutelage" envisaged by the founder of modern China, Sun Yat-sen, under which Chiang and his party had carried on the government virtually alone. In the summer of 1945 Chiang invited the communists to participate in the

plan to set up a democratic regime and offered them important posts in an interim government, but despite prolonged negotiations for general agreement and despite the efforts of General George C. Marshall to establish unity, the negotiations repeatedly broke down, with outbreaks of civil war in widespread areas.

Thus the whole life work of Chiang in establishing the independence of China, with freedom both from foreign domination and domestic disunity, was gravely threatened. Many Chinese felt that the martyrdom of China through eight years of war had merely resulted in placing soviet Russia in the position formerly occupied by Japan. The problem of establishing internal unity with the communists was virtually inseparable from this fear of Russian encroachment because of the fact that the Chinese communists, in spite of some constructive economic reforms, were faithful followers of the Communist party line and of every turn of soviet foreign policy, including the Hitler-Stalin pact and the recognition in 1938 of "Manchoukuo" as part of Japan. Mao Tse-tung was a leading member of the Communist International until its formal dissolution in 1943. Whether the idea was justified or not, the communists were regarded by many Chinese as a fifth column serving a foreign power, a nation which already had encroached on Chinese territorial integrity and with which China still had the longest common frontier in the world. These fears strengthened the hands of nationalist and conservative elements within the Kuomintang. There were widespread protests throughout China after the revelation of the Yalta agreements, one result being that Chiang probably could not grant all the communist demands even if he wished to do so.

In view of these developments the future of China seemed obscure at the end of the decade 1937–46, but that had been the situation, basically, throughout the 22 years during which Chiang had guided the destinies of his country. He still remained the symbol and the hope of China's unity, a man who retained the respect even of many of his political opponents. His patience, his talent for negotiation and his capacity to control the extremists in his own party, while at the same time steadfastly refusing to compromise on the basic issues of China's unity and independence, might still win. Chiang Kai-shek, Madame

Mme. Chiang (Mayling Soong) (1898-), wife of General Chiang Kai-shek (q.v.), Chinese leader, was born in Shanghai, daughter of Charles Jones Soong, who as a poor boy was educated in the U.S. to be a missionary, and made good in his own country as a publisher. He was Sun Yat-sen's best friend. One of three famous sisters, Meiling was educated in the U.S. and was graduated from Wellesley college in 1927. Her career became a most remarkable one for any woman, most particularly for one of her nationality. Returning to China, she served on the China Labour commission, the first woman ever appointed to this agency. She married Chiang in 1927. When her husband was kidnapped by Chinese rebels in 1936, she flew to their Sian stronghold, induced them to release Chiang and was instrumental in persuading him to forge a united front with the Chinese communists who wanted to halt Japanese encroachments in China. A strong and vivid personality, Mme. Chiang inspired Chinese fighters, aided

thousands of orphans, resettled refugees and established hospitals. In Nov. 1942 she travelled to New York city to undergo medical treatment. She visited the White House on Feb. 17, 1943, and addressed the congress on the 18th, the first private citizen ever to do so. She asked for more help in the Pacific war, pointing out that Japan controlled more resources than Germany. In Nov. 1943 she accompanied her husband to Cairo, serving as his interpreter in the conversations there with Prime Minister Winston Churchill and President F. D. Roosevelt.

Ill health then curtailed her activities and necessitated another visit to a New York hospital in 1945, but she later declared herself cured and was again at her husband's side, working for postwar China's settlement. (Em. H.)

Chicago

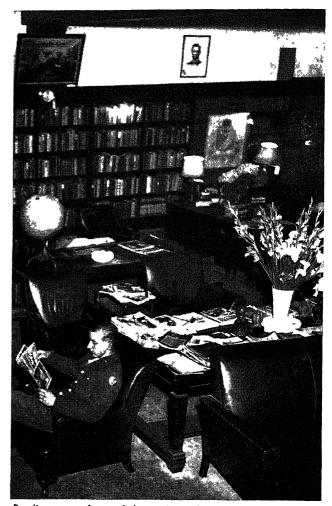

Chicago's second war decade in the 20th century was colourful but out of character. Stormy and brawling through its 1st century, the city led a relatively calm political life from 1936 to the end of World War II.

For the first time, Chicago was ruled by one dominant political organization with no effective opposition. Mayor Edward J. Kelly, originally named by the city council to fill the vacancy created by the assassination of Mayor Anton J. Cermak in 1933, was overwhelmingly re-elected in 1935, 1939 and 1943. He not only ruled the city but was actual head of the political "machine" bequeathed him by Cermak and George W. Brennan, Democratic city and state "bosses."

Notorious after World War I for organized crime and private gang wars, Chicago subsided into unwonted calm under Mayor Kelly. The repeal of prohibition and the undisputed power of the ruling political organization in the award of privileges and patronage minimized possible rewards of criminal organization and gang feuds. Except for a few flareups over illegal gaming privileges, crime in Chicago assumed a personal, sporadic aspect.

During the ten years from 1937 to the close of 1946 there was the closest liaison between the city government of Chicago and the administration at Washington. In national and state elections, the Chicago organization rolled up huge majorities that kept Illinois in the Democratic column at every presidential election. A city congressional delegation overwhelmingly Democratic was at the service of Presidents Roosevelt and Truman. In return, Chicago received grants of federal funds that lifted the city government and its subsidiary administrative units from virtual bankruptcy to affluence. Other grants-in-aid made possible public works of great value which in turn enhanced the prosperity of Chicago business men and wage earners. Federal investment and spending overshadowed private enterprise, although the latter recovered vigorously from depression.

In 1937 the city debt exceeded the limit on borrowing power imposed by the constitution of Illinois. Because of federal aid to charitable relief, public works and other functions, however, and as a result of war prosperity, the finances of the city and of the six major governmental units of the metropolitan area improved rapidly thereafter. In 1944 it was possible to introduce a new system of assessing property for taxes at 100% of value. As a result, the total gross debt of the city of Chicago (proper), the board of education, the park district, Cook county, the sanitary district and the forest preserve district decreased from \$473.463.444 in 1936 to \$231,385,760 at the close of the fiscal year 1945. The borrowing power of the six taxing

Reading room of one of the servicemen's centres at Chicago, III., which extended hospitality to 19,000,000 servicemen of the United Nations between 1941 and 1946

units increased from virtually nothing to \$963,202,832. The assessed value of property within the city limits of Chicago increased from \$1,956,928,663 to \$4,732,228,415.

Improvement of city finances and contributions from the U.S. Public Works administration made possible the revolutionary change in control of the Chicago river and Chicago's sewage required by the supreme court's limitation upon diversion of water from Lake Michigan to the drainage canal to 1500 cu.ft. per second. In addition to a control lock at the lake entrance to the river, 40 mi. of intercepting sewers were built, varying from 5 to 20 ft. in diameter, to collect 100% of domestic sewage and deliver it to new treatment plants. Two great sewage treatment plants were built with a combined capacity for purifying 1,125,000,000 gal. per day. Total costs was \$62,000,000; the Federal contribution was \$16,000,000 in cash. The sanitary district contributed \$4,000,000 cash and sold \$42,000,ooo in bonds to the government, which afterward disposed of them at a profit.

Chicago's lake front drive system north of the river was converted into a grid of high-speed boulevards and linked to the south park boulevards by a new bridge near the mouth of the river. The government contributed approximately \$50,000,000 to these projects. Total Public Works administration expenditures in Chicago and environs were approximately \$165,000,000. In the same period the WPA and other federal relief and security agencies disbursed approximately \$1,000,000,000 in the area. WPA built 3,000

mi. of subsidiary highway in the Chicago area, paved many streets and constructed several new parks.

In 1938 the first important addition to Chicago's rapid transit facilities in 30 years was begun. The traction fund composed of the city's 55% share of street car net earnings had been stuffed with frozen paper of local governments. When it thawed out, new plans for a subway were drawn. As had been the case several times before, the plans were grandiose and costly—following slavishly New York opencut, high-level models. At the suggestion of Harper Leech, a journalist, backed by J. Norman Pierce, plans for deep tubes bored cheaply through the basic clay under the city were proposed.

Frank Knox, then publisher of the Chicago Daily News, afterward secretary of the navy, induced his personal friend Harold Ickes, administrator of PWA, to back the new plan. As a result, the government contributed \$25,000,000 and the city traction fund put up \$34,000,000.

Construction began Dec. 17, 1938. The first unit—4.73 mi. from 13th street to Armitage avenue, mostly under State street—began operation in Oct. 1944. Tubes of approximately equal length were bored under Lake street, Dearborn street and Milwaukee avenue, but operating equipment was lacking for completion until long after the end of World War II. General supervision and design were the responsibility of Joshua D'Esposito, noted engineer. The subway crystallized sentiment for transit unification under public control. By a vote of 285,596 to 46,594 on June 8, 1945, the people established the Chicago Transit authority to buy and operate the street, railway, bus and elevated lines.

For 75 years a storm centre of the U.S. labour movement, Chicago escaped much of the turmoil occasioned by unionization of mass production industries by the Congress of Industrial organizations. The American Federation of Labor was too firmly entrenched to invite invasion. Only on the northern outskirts of the Chicago area at Waukegan, and at the Republic Steel plant near the southern edge of the city, were there any violent repercussions of the great labour outbreaks of 1937. On May 30, 1937, 10 persons were killed in a clash between police and strikers at the Republic Steel plant. Violent controversy followed. A coroner's jury pronounced the killings justifiable homicide. A U.S. senate committee arrived at a contrary conclusion. Sixty-one participants in the clash were dismissed with nominal fines Dec. 21, 1937.

After war industry had attained a high tempo, organization of factory workers by the C.I.O. became almost universal, but there were no major industrial disturbances until near the end of the war. In 1945, 178,000 workers were on strike in 415 plants. A strike of truckers was broken by the U.S. army, which manned the trucks.

For war purposes some 265 new manufacturing plants were constructed in Chicago. Approximately \$1,000,000,000 was contributed by the government for plant construction and expansion. The capacity of 300 plants was increased at private expense.

Among the new units was the largest bomber plant in the world and the largest aeroplane engine plant, with another of about half its capacity, also the greatest cargo plane plant. Aluminum rolling mills were added to Chicago's industries.

In the fast growing field of electronics and radio, Chicago was far advanced, and quickly took a leading position in radar equipment and in the manufacture of military precision instruments. Research into the possibilities of releasing atomic energy was initiated by scientists using the facilities of the University of Chicago. On Dec. 2,

1942, the first chain reaction for the fission of uranium atoms was produced underneath the west stand of Stagg field—man's first tapping of nuclear energy.

The cumulative total of war contracts reached \$7,828,221,000 late in 1944, most of which were executed before V-J day, in addition to several hundreds of millions of dollars worth of subsequent orders.

Approximately 475,000 men and women of Chicago and immediate environs served in the armed forces. The city was the hub of troop movements to the two coasts. Free lodging, food, entertainment and transit fares were supplied to all soldiers and sailors for the asking, and more than 19,000,000 visits to Service Men's centres were recorded. Mrs. Edward J. Kelly, wife of the mayor, was a potent organizer of these services. All war bond issues were heavily oversubscribed in the Chicago area.

Chicago began the celebration of its chartering as a city by the state of Illinois on March 4, 1937, with a series of pageants. The climax of this series was a celebration of the opening of the Outer Drive bridge Oct. 5, 1937, at which President Roosevelt delivered his "quarantine speech" denouncing dictators which led to the abortive Nine Power conference at Brussels to consider far eastern affairs.

At the close of 1946 Chicago—the scene of two highly successful world's fairs, in 1893 and 1933–34—was discussing plans for another international exposition in 1950 to commemorate the coming of peace. (L. H. L.)

Chiefs of Staff, Combined and Joint

The "Arcadia" conference between United States and British political and military leaders which met in Washington, D.C., after the Pearl Harbor attack, resulted in the establishment in Jan. 1942 of the Joint and Combined Chiefs of Staff organizations to co-ordinate U.S. and British direction of World War II.

Composing the U.S. joint chiefs were Admiral William D. Leahy, chief of staff to the president; General George C. Marshall, chief of staff of the army; Admiral Ernest J. King, chief of naval operations; General Henry H. Arnold, commanding general, army air forces. This group also sat with the Washington representatives of the corresponding British officials. The combined committee used the title of Combined Chiefs of Staff and assumed the responsibilities

¹Head of Mission

of strategic direction over all theatres (except Russia), including the determination of specific operations, the allocation of resources to them, and their relative priorities.

Responsibility for executive and operational direction of the conduct of World War II in each theatre was assigned by the combined chiefs to either the U.S. chiefs or the British chiefs. The only exception was in the case of the European theatre of operations, where General Dwight D. Eisenhower dealt on combined matters directly with the combined chiefs. Thus, China and the Pacific were assigned to the U.S. chiefs, and the Mediterranean and southeast Asia to the British chiefs. In the Mediterranean and in southeast Asia, the British and the U.S. were so integrated that a multitude of details came to the combined chiefs for resolution. Examples were the exact number of divisions, landing craft, aircraft, to be allotted, and the target date for each operation. In the Pacific and in China, where practically all resources allocated by the combined chiefs were under U.S. control, these matters were resolved by the U.S. chiefs.

The U.S. chiefs were responsible directly to the president; the British chiefs to the prime minister, and the combined chiefs were responsible corporately to both.

A vital principle laid down by the combined chiefs was that of unity of command which placed responsibility and authority for an operation under one commander who was responsible to the joint or combined chiefs.

The U.S. joint chiefs organized planning and advisory committees consisting of representatives from the army and navy and, where appropriate, from other agencies. These advised the joint chiefs in matters of strategy, operational and administrative planning, psychological warfare, intelligence, transportation, assignment of materials of war, communications, meteorology, weapons, petroleum, civil affairs, etc. The joint chiefs' decisions were executed by the war and navy departments, the more smoothly and promptly since members of their staffs had functioned on the joint committees whose studies had contributed to the decisions. Important among the supporting agencies was the Office of Strategic Services, charged with psychological warfare and other quasi-military functions which lay beyond the orthodox responsibilities of the army and navy.

Most of the joint committees worked with a British counterpart, thus forming combined committees to advise the combined chiefs.

The pooling of the skills of these leaders, and the authority which they exercised in applying the entire military, industrial and technical resources of their two nations at war, were responsible in large measure for the Allies' phenomenal success in first checking the axis's overwhelming ascendency and then promptly administering total defeat in closely-knit global campaigns. (T. N.)

Chifley, Joseph Benedict

Chifley (1885—), Australian statesman, was born Sept. 22, 1885, at Bathurst, New South Wales, Australia. He left school early in his youth and worked on the Australian railroads, becoming a locomotive engineer. After joining the Australian union of locomotive engineers, he developed an interest in politics and trade unionism. In 1928, he was elected as a Labour candidate to the commonwealth house of representatives and was named minister of defense the following year. Following the Labourite defeat in the 1931 elections, Chifley lost his seat, although he served succeeding governments in technical capacities from 1935–40. Running again for the house of representa-

tives in 1940, he was returned to his seat. After John Curtin formed his Labourite government in Oct. 1941 he appointed Chifley to the post of treasurer of the commonwealth; in that capacity Chifley designed many of the wartime financial regulations. He implemented the government's control of stock exchange transactions, extended price control measures, increased taxes and sponsored measures which gave the government supervisory powers over the entire banking system. He held the additional post of minister for postwar reconstruction from 1942–45.

Chifley, who was acting premier during Curtin's illness, was elected head of the Labour party on July 12, 1945, and was sworn in as prime minister the following day (July 13). He attended the dominions conference of foreign ministers in London in April 1946, and visited Pres. Truman in Wash., D.C., the following month; he also discussed lendlease and reciprocal aid problems with state department officials. In the Australian Labour party's election of a new cabinet, Oct. 31, 1946, Chifley was retained as prime minister.

Child Guidance

Child Labour

See CHILD WELFARE.

Children in World War II

The children who survived the impacts of World War II were subjected to violent and far-reaching spiritual and cultural displacements. The effects were especially impressive and serious in view of growing social concern about better ways of feeding, protecting and guiding children. Everything learned about personality and the development of native capacity and about mental as well as physical health had made it more and more evident that any adverse effect upon children was a threat to civilization itself, to the whole future of humanity.

Statistical information regarding the effects of the war upon children was meagre. The fate of the children was so closely tied up with what was happening generally that in most areas a separate accounting was impossible, especially as much of the administration machinery was diverted to immediate efforts. For many kinds of information regarding children in most of the devastated regions, it was impossible to make reasonable estimates. Lacking statistics to measure the various kinds of damage done to children or to compare the destruction in various countries, students of the problem could at most sense the quality of the conditions resulting from the war and of the effects upon the boys and girls who were to make up and rebuild the future of each state or nation.

In every occupied country, forced evacuations and displacements of persons automatically disrupted the lives of children, their security, their physical well-being and their normal mental and emotional development. Invading armies systematically removed food, livestock, fuel and clothing in such quantities that most of the population suffered serious privations, which came especially hard upon the children.

Nutrition and Disease.—Starvation and sickness killed more children and then left the survivors more enfeebled in China than in any other invaded country. Aside from any stores they could carry off, the Japanese laid the very earth waste.

Standard diets and food requirements for children had been set by the League of Nations Technical Commission on Nutrition. According to these standards children 1 to 2 years of age require 1,000 calories per day; and the needs increase to 2,400 calories for children more than 11 years. Children's food intake got down to 500-700 calories per day for all children in Poland; to 1,000 calories in Belgium and Norway; 1,100 calories in France; and 1,500 calories in the Netherlands. In most of the other occupied countries the conditions were no better. The effects were shown in stunted growth, marked loss of weight, general debilities and lowered resistance to disease. Tuberculosis became rampant among children in many cities, especially among adolescents. Rickets and scurvy and skin diseases appeared in areas which had had no deficiency diseases for many years before the war.

In contrast, Germany's loot supplied a fairly adequate diet to its entire population during the first few years of the war, with extra rations for those doing heavy workand for children. England furnished another interesting contrast. Dietary surveys before the war showed about one-third of the population to be undernourished. During the war, food rationing, special regulation of food processing and the "enrichment" of flour, and supplementary issues of vitamins, milk and other special foods, measurably improved the general health and physique of the children. In the U.S.S.R. too, special efforts were made to meet the threat to the children brought by the invasion of the Germans in June 1941. Almost immediately orders were issued to set up nurseries and homes for children beyond the war zones. Exceptional attention was given to the nutrition of all children from infancy on. Steps were taken to guard children against deficiency diseases.

Everywhere the destruction of buildings and of entire towns and unbelievable crowding left many families homeless. Exposure, cold, the lack of soap and of the barest sanitary facilities raised the incidence of communicable diseases. And the shortage of drugs and medical supplies raised the death rate further. Diphtheria, typhoid fever and typhus reached epidemic proportions. Body parasites became common in many regions.

A good general index of the destructiveness of the war upon children was the rapid rise of infant death rates above those previously prevailing. Stillbirths and miscarriages also increased. The death rates of children of various ages, as compared with the rates for the general population, rose markedly. In Germany, the infant death rates remained nearly constant during the first three years of the war and rose slightly in 1942.

There were great variations among the occupied countries, as might be expected. At one extreme were countries like Denmark, Norway and the Netherlands, whose people the Germans invited to co-operate for the common good by graciously identifying them with their own Nordic "superrace." At the other extreme was Poland, whose people rated only enough higher than the Jews to save them from the utmost in cruelty and bestiality.

In Poland, the Germans were more ruthless, more deliberate, more calculatingly cruel and more thorough than in any other country. They exterminated 10% of the people and sought to prevent the natural increase of the population by restricting marriage to women above 25 years and men above 28 years. And they removed to German institutions all children born to younger women.

Of the 6,500,000 Jews in Europe before the war, outside the U.S.S.R., only 1,500,000 remained at the close—mostly "homeless, sick and destitute." That only about 10% of the surviving Jews in occupied countries were children indicates the intense suffering and lasting hurt. By 1946 there were practically no children between the ages of 6 and 12 years among the displaced Jews in Germany; the

number of children who survived in concentration camps was consistently small.

Where numerical data regarding children were lacking.

Where numerical data regarding children were lacking, estimates were made roughly on the assumption that about one-third of a population consisted of children. This ratio varied from country to country and as between rural and urban areas; but it was probably adequate for an overall picture. In the table on page 624 estimated figures are set in square brackets.

Education.—In accordance with their thousand-year plan for the world, the Germans undertook to demoralize the future of the occupied regions by deliberately destroying or perverting the educational and cultural institutions. The Japanese, in their earlier invasion of Chinese provinces, had made use of opium for the demoralization of their future vassals.

Except in Denmark, where numbers of schools were taken over and several teachers replaced by Germans, school buildings in large proportions were converted into barracks, administrative offices, warehouses and sometimes into hospitals; and in many cases they were deliberately destroyed.

Through the schools, play organizations and general propaganda, the Germans tried to undermine democratic sentiments and principles, to destroy national pride and to make the "ideology" of young people and children conform to nazi doctrine and attitudes. German was substituted for the native languages. Textbooks were "corrected" or replaced by others. The content of history teaching was standardized. All references to World War I were eliminated. Secondary schools suffered particularly, as they were possible sources of leadership. Some were converted into training schools for technicians. Where they were kept for the education of a selected few, the curriculum emphasized the classics. Children of all ages were formed into special groups outside school hours for cultivating of "correct" understanding, "correct" attitudes and useful skills in marching, taking orders, athletic performance, and so on-all of course in line with the nazi philosophy. In many cases school children as well as teachers were forced to contribute hours of labour regularly.

In all countries teachers and professors were removed to make way for "loyal" or German replacements. Many were arrested, sent to concentration camps or placed at manual labour; and in a few cases they were executed as dangerous characters. The object was to weaken educational resources generally and to eliminate unsound influences upon the minds of children.

Poland was explicitly marked in the official doctrine "to be made into an intellectual desert." All the universities and colleges were liquidated; other cultural institutions, laboratories, scientific collections, libraries were pillaged and laid waste. Secondary schools were immediately eliminated, except for trade schools; and these were adapted to the needs of the Germans. At the end of the war, virtually all the children in Poland under 16 years of age were without elementary schooling. Very few of the older adolescents and young adults were equipped to carry forward the needed educational and cultural efforts. Half the surviving teachers were completely lost to the profession.

The number of schools that continued to operate in an occupied country was no measure of the educational effectiveness remaining. In many cases schools had to be closed for lack of fuel. Absenteeism was generally great because so many children had no suitable clothing; footwear was especially lacking. But most of the children who

did attend were too hungry or exhausted to profit from the best efforts the teachers might make.

Attempts to transform the thought of the conquered peoples were generally not successful, in spite of the great destruction they caused. To supplement these methods, parties of children were sent from conquered regions to Germany on holiday tours, and in some cases for longer periods of schooling, that they might acquire the "Aryan" spirit.

Teachers in all countries resisted attempts to convert them and to make them put pressure on the children. In the Netherlands, Norway, Belgium and Czechoslovakia, the resistance was sufficient to produce considerable defiance on the part of the children and of their parents. When schools were closed or when teachers were removed, many families managed to continue their preferred kind of instruction secretly. The University of Leyden, in the Netherlands, was closed when a professor protested the dismissal of a Jewish professor. All the universities were closed in Czechoslovakia. In Greece, the university buildings at Salonika were turned into a German hospital, while those of the Athens technical university were turned into an Italian hospital. The University of Athens was closed when the students continued to resist the new order. In many countries, even younger students worked in the underground; others fled in groups to continue their studies elsewhere or to join the Allies.

In France, the Vichy government aided the German plan by encouraging church schools as against the secular schools; by making the secondary schools classical in form and restricting them to middle-class children; and by weakening the primary schools. Three of the universities were closed and the goal seemed to be to "bring France back to the middle ages." But in Norway, where resistance to nazification was general, it was felt that the occupation "set education back two generations."

In the soviet invasion, the Germans wrecked and defiled school buildings, scattered the teachers, destroyed books. In Stalingrad, 95 schools were burned down as well as all kindergartens, libraries, the Physical Culture institute and the Palace of Young Pioneers. When the soviets came back, schools were quickly reopened; students brought back books, maps and other equipment, even furniture, which they had buried when the Germans came.

The Japanese invasion of China brought similar destruction of universities and schools, wholesale arrest or execution of teachers, the replacement of the curricula and compulsory teaching of Japanese. Young people were organized for special training and forced service. A distinctive development in China was the great migrations of students in groups and individually out of occupied areas, and the transportation of school and university materials into Free China, where more students attended schools and colleges than in all of China before the war. Teaching was carried on, sometimes underground, with help from the local population. Students were organized in small groups for ready escape; the "mobile" schools moved away when the Japanese approached, and moved back when they left.

Special Provisions for Care and Protection.—Before World War II, the welfare of children was receiving more and more attention in all countries. Special efforts were made to meet the war emergency and to counteract, so far as possible, the immediate impact of war conditions upon children. The extent and the effectiveness of such efforts were largely determined by economic and technical resources as well as by the violence or magnitude of axis interference with a people's life. And the char-

acter of the provision for children was also influenced in each country by the cultural unity and the traditional patterns of community and family life. An indication of the common goals and of some ways of achieving them under special conditions may be gained from an account of a few distinctive undertakings.

The outstanding project for anticipating special wartime conditions was England's evacuation project for removing children from congested population centres, to protect them from air raids. Plans for evacuation were completed in the summer of 1938. The first evacuation, starting two days before the outbreak of war in Sept. 1939, moved 1,381,000 persons in four days-about half the number eligible. Various difficulties at the reception centres were smoothed out in about three weeks. The most surprising and disconcerting of the difficulties turned out to be social or cultural rather than administrative or mechanical. Neither hosts nor guests were quite prepared to deal with mothers and children of radically different habits and attitudes. Emotional tensions among the children manifested themselves frequently in ways that aggravated the situation. A different kind of difficulty arose from the fact that as air raids began, medical examinations became impossible for all the children and many brought with them to the reception centres scabies, impetigo and pediculosis, which rapidly spread to others. As no air raids took place in the following months, about 90% of the mothers with their small children and about half the unaccompanied children returned to their homes by the following January. In June 1940 a continuous removal of weekly parties was begun. In August, when bombing attacks were started, the process was accelerated until groups were leaving daily. As the raids decreased, many mothers and children drifted back to the cities; and by the end of 1942, only some 222,000 children remained in all the reception centres.

The evacuation of the younger children from the day nurseries and nursery schools was considered an unqualified success. The experience as a whole, however, pointed to an acute shortage of social workers and to need for their better training as well as to a great need for psychiatric care for children. Steps were immediately

Scavenging in a U.S. army mess hall during 1945, three children of Berlin tried to find scraps to supplement their own thin rations

taken to meet these needs and to improve the schools and the medical care and the billeting in the reception centres. In spite of crowding, material shortages and the interruptions of routine, the children of England generally benefited both in health and in their education. Nearly all the children who had been evacuated were decidedly improved in physique and general health as well as in their bearing and self-assurance.

Provisions were made for the health care and continuous education of the many British children who remained in the cities for various reasons or who continuously drifted back from the reception centres to their homes. In bombed-out areas and in certain industrial areas the shelters came to be almost continuously occupied by families and by schools. Throughout England, special measures for the nutrition of mothers and children included milk for pregnant and nursing mothers and for children to the age of five years (at a low cost or free—where indicated) and a vitamin issue. Milk was also provided for 4,000,000 school children; and meals in schools for 1,000,000. Repeated surveys showed that the children's health was consistently better than it had been before the war and that the condition of their teeth had improved.

In the soviet union, after the German attack in June 1941, tens of thousands of children were moved from the war zones to numerous homes opened for them in the rear. Children were evacuated from besieged cities. Special arrangements were made to care for orphaned children or those who had become separated from their families; at the end of the war 250,000 had been adopted. Some difficulties resulted from the return of parents presumed dead, but adoptions or foster homes were still preferred to institutional care although homes were provided for all children in need.

For children who could not be evacuated, shelters were provided for educational and other activities under supervision, in addition to health centres or hospitals. Special attention was given to the nutrition and health of all the children. Although the Germans systematically started epidemics in the occupied regions, the physicians and sanitarians kept these diseases from spreading to the rear.

Soviet children generally received unusual attention because the common thinking literally and seriously looked to children as the nation's future. Individual adults of all classes seemed to feel a personal concern about each individual child. "The best of everything goes to the children" was a common sentiment.

With children's welfare accepted as a national concern in the U.S.S.R., the emphasis naturally shifted to babies and mothers. Mother and child consultation centres were established in all regions; by the middle of 1944, there were 3,499 such centres in cities and 2,304 in the country. The most elaborate developments were in the establishment of day-care centres and nursery schools. The soviets apparently went furthest in taking infants-as young as six months-where mothers preferred to work rather than remain at home. The question of "need to work" never arose, since the mother who cared for her child received her regular pay just as her child received regular medical or other special services. There were nearly 300,000 yearround nurseries toward the end of the war. In the summer of 1944, 4,500,000 farm children were cared for; special seasonal nurseries were set up to follow the harvests. There were few kindergartens before the war; by 1941 there were 14,335. At the end of 1944, nearly 18,000 were caring for about 2,000,000 children. Many of these were moved to the country during the summer months for full-time care, while their mothers were working. In addition, summer camps looked after 300,000 children in 1944. Soviet children on the whole came through with a good health record and in good physical condition; and even those who had become separated from their families showed a high degree of self-confidence and security.

In China, children constitute a larger portion of the total population than in European countries; and the war was relatively more destructive of human potentials. The traditional family pattern still common in vast areas was unable to manage the displacements with the accompanying destruction of the very sources of subsistence. Mil-

lions of children separated from their families and customary routines of life were gathered in camps that offered hardly more than the barest physical existence and a minimum of educational supervision. In many cities nurseries were established and also centres for the feeding and medical care of children. The resources were pitiably inadequate. And besides the large numbers who perished from disease and starvation, there remained uncounted children wandering about the country-side, begging for food, sleeping anywhere and helping themselves however they could.

In the United States, nearly a quarter of the nation's families were displaced during the preparations and actual participation in the war. The children bore the brunt of the uprooting of homes as well as of war's direct impact upon families. Concern for children was further heightened when the draft revealed unsatisfactory health conditions among young people generally.

Nursery schools, day nurseries or day-care centres were rapidly increased in numbers to care for young children whose mothers were drawn into various kinds of urgently needed work. By the end of the war there were 2,000 such centres set up with funds furnished by the federal government besides many hundreds of others under private auspices or set up in connection with war industries.

The age at which children were accepted in these centres went steadily down as mothers found it more advantageous to work at some job than to spend all their time at home. The hours were lengthened from the traditional "school hours" to fit the working hours of the mothers, and as more women worked in shifts, many centres adopted 24-hour schedules. The program was extended to year-round operation. Some also arranged to have hot, cooked food ready for the mother to take home to the family when she called to take her child or children home. These child-caring centres developed a new type of "teacher," trained in understanding young children and concerned with the well-being of the entire child rather than with specific learnings. They also developed more systematic co-operation with medical and health agencies and with social and psychiatric workers.

After the U.S. entered the war officially, the largest single contribution to the morale of married soldiers and sailors was the constant assurance that their wives and children were being well looked after. The "E.M.I.C." project (emergency maternity and infant care) for the wives of men in the armed service was set up under the administration of the children's bureau in April 1943. It included prenatal care, delivery (in hospitals wherever possible) and the health care of infants and children. Up to Nov. 1946, 1,000,000 births had come under this service.

Health care for U.S. children of school age was widely but rather unevenly extended throughout the country. Special efforts were made to stimulate and co-ordinate local, state and national activities on behalf of children, made necessary by the fact that so many were diverted from school by the labour shortage and the chance to earn money. Nearly one-third of the boys and girls between the ages of 14 and 17 were at full-time work during the school term; in the summer of 1944, 5,000,000 of this age group (more than half) were at work. Thousands of younger children also had to be protected against violations of labour standards for young workers.
